THE COMMONWEALTH

The Commonwealth is a free association of independent member nations together with their dependencies at various stages of political advance. Member nations include Britain (Canada, Australia, New Zealand whose membership of the Commonwealth dates from the Statute of Westminster, 1931, India (1947), Pakistan (1947), Ceylon (1948), Ghana (1957), the Federation of Malaya (1957) which in 1963 became Malaysia, the Federation (now the Federal Republic) of Nigeria (1960), Cyprus (1960), Sierra Leone (1961), Tanganyika (1961) which in 1964 united with Zanzibar (1963) to become Tanzania, Jamaica (1962), Trinidad and Tobago (1962), Uganda (1962), Kenya (1963), Malawi (1964), Malta (1964), Zambia (1964), the Gambia (1965), Singapore which seceded from the Malaysian Federation (1965), Botswana (1966), Guyana (1966), Lesotho (1966), Barbados (1966), Mauritius (1968), Swaziland (1968), Western Samoa (1970), Fiji (1970) and Tonga (1970). Nauru which became independent in 1968 has the status of special membership of the Commonwealth. *See also* Section C Part II.

I—MEMBERS OF THE COMMONWEALTH (including territories for which members other than the U.K. are responsible)

Country	Land Area (sq. miles)	Recent Population Estimates
United Kingdom	94,214	55,534,000
Canada (incl. Newfoundland and Labrador)	9,984,610	21,007,000
Australia (Commonwealth of)	9,837,000	12,170,000
Cook Island	2	1,000
Christmas Island	1	1,000
Norfolk Island	1	1,000
Papua and New Guinea	188,540	2,350,000
Antarctic territory	1,000,000	—
New Zealand	103,736	2,781,000
Island Territories (Cook Is. self-govt.)	194	24,475
Ross Dependency	180,000	—
India (Republic of)	1,268,000	19,749,000
Pakistan (Republic of)	365,520	111,530,000
Ceylon	25,332	11,964,000
Ghana (Republic of)	91,843	8,545,561
Nigeria (Federal Republic of)	356,669	62,650,000
Cyprus (Republic of)	3,572	681,000
Sierra Leone	27,000	2,475,000
Tanzania (United Republic of)	12,820	1,311,000
Uganda	31,300	5,130,000
Jamaica	4,411	1,972,000
Trinidad and Tobago	1,980	1,030,000
Kenya (Republic of)	224,940	10,890,000
Malaysia (Federation of)	129,000	10,364,000
Malawi (Republic of)	45,411	11,300,000
Malta and Gozo	1	314,175
Zambia (Republic of)	291,000	4,100,000
Gambia (Republic of)	4,000	307,000
Singapore (Republic of)	225	2,037,000
Botswana (Republic of)	222,000	611,000
Guyana (Republic of)	83,000	750,000
Lesotho	11,716	969,000
Barbados	166	200,000
Mauritius	805	810,000
Swaziland	6,704	29,000
Western Samoa	1,097	141,000
Fiji	7,095	500,000
Tonga	270	81,000

* The United Kingdom retains sovereignty over areas totalling about 99 sq. m.

The West Indian Associated States (Antigua, St. Kitts-Nevis-Anguilla, Dominica, St. Lucia, St. Vincent and Grenada) enjoy a special relationship with Britain. They are fully self-governing but Britain retains general responsibility for their defence and external relations. This relationship can be terminated either by the island territory concerned or by the British Government. Anguilla unilaterally seceded from the St. Kitts union in 1967.

**II—TERRITORIES FOR WHICH THE U.K. IS RESPONSIBLE AND WHICH ARE
ADMINISTERED THROUGH THE FOREIGN AND COMMONWEALTH OFFICE**

(Some of the very small or practically uninhabited islands have been omitted)

Region and Territory	Status	Land Area (sq. miles)	Recent Population Estimates
Central Africa			
Rhodesia	Colony (self gov.)	150 833	5 070 400
Far East			
Brunei	Protected state (self gov.)	2 226	130 000
Hong Kong	Colony	398	3 088 000
Mediterranean			
*Gibraltar	City (non self gov. terr.)	2½	27 000
Caribbean			
Montserrat	Colony	39	14 500
Cayman Is.	Colony	100	10 000
British Honduras	Colony	8 866	116 000
Virgin Islands	(intern. self gov.) Colony	59	10 500
Western Pacific			
Pitcairn	Colony	2	186
Western Pacific High Commission Territories			
British Solomon Islands Protectorate	Protectorate	11 500	148 000
Gilbert and Ellice Islands Colony	Colony	369	55 000
New Hebride	Anglo French Condominium	5 700	80 000
Atlantic Ocean			
Falkland Islands	Colony	4 700	2 093
Dependencies			
S. Georgia	Dependency of Falkland Islands	1 450	531
S. Sandwich Is.	Dependency of Falkland Island		Uninhabited
British Antarctic Territory			
S. Shetlands S. Orkneys Graham's Land	Colony	500 000	No permanent inhabitants
Bahamas	Colony (intern. self gov.)	4 404	170 000
Turks and Caicos Is.	Colony	166	6 272
Bermuda	Colony	21	51 000
St. Helena	Colony	47	5 000
Ascension	Dependency of St. Helena	34	1 527
Tristan da Cunha	Dependency of St. Helena	38	980
Indian Ocean			
Seychelles	Colony	156	49 981
†British Indian Ocean Territory			1 400

Note—An illegal declaration of independence was declared in Rhodesia on 11 November 1965. See Section C Part II.

* Under the new Constitution which came into effect in 1989 Gibraltar became known as the City of Gibraltar. It is no longer a colony but 'part of Her Majesty's dominions'.

† This territory consists of the Chagos Archipelago (formerly part of Mauritius) and Aldabra, Farquhar and Desroches Islands (formerly part of Seychelles).

GENERAL INFORMATION

Some three thousand entries, including a number of scientific terms and explanations. Cross references direct the reader to fuller information elsewhere in the book. A list of Nobel Prize Winners will be found at the end of the section.

GENERAL INFORMATION

A

Aard-vark (Dutch *aarde* = earth + *vari* = pig) name given by the Boers to a genus of ant-eating mammals peculiar to Africa. They are nocturnal and burrowing with an arched back and usually grow to a length of 5 ft.

Abacus a device for making arithmetical calculations, consisting of parallel bars on which are strung movable coloured beads. The earliest form of this instrument was used in Mesopotamia about 3000 B.C. and its use spread westwards throughout the Greco-Roman world and eastwards to China. An efficient form of the abacus is still used today in parts of Asia.

Abdication The term usually refers to the renunciation of the royal office by a reigning monarch. Both Edward II (1327) and Richard II (1399) were forced to abdicate. James II left the throne vacant without waiting for a formal deposition and the abdication of Edward VIII was effected by the Declaration of Abdication Act, 1936. Since 1688 when Parliament declared James II to have abdicated by reason of desertion and subversion of the constitution, no British monarch can abdicate without the consent of Parliament.

Aberration in astronomy is the apparent displacement of a star due to the speed of the observer with the earth (see Parallax). In optics (i) spherical aberration is when there is blurring of the image and fringes of colour at its edges due to failure of lens to bring light to a single focus. (ii) chromatic aberration is due to the refractive index of glass being different for light of different colours. For instance violet light is bent more than red.

Abiogenesis or spontaneous generation the origination of living from non living matter. The term is applied to such discredited ideas as that frogs could be generated spontaneously by the action of sunlight on mud or maggots arise spontaneously in dead meat without any eggs from which the maggots hatch being present. Spallanzani (1729-99) upset the hypothesis of spontaneous generation. Pasteur dealt it a death blow.

Abominable Snowman. See Yeti.

Aborigines a term first applied to an ancient mythical people of central Italy derives from the Latin *ab origine* = from the beginning. It now signifies the original inhabitants of any country in particular the aboriginal tribes of Australia. In contrast to their highly complex social and religious customs the material culture of Australian aborigines is very low and ill adapted to stand up to contact with European civilisation. Originally estimated at 300 000 their number has dropped in the last 200 years to some 40 000. A referendum held in 1967 showed that the majority of Australians wished to give the Aborigines citizen rights and thus end the discrimination against them.

Absolute Temperature **Absolute Zero** This is a refined notion requiring some study of thermodynamics for its full understanding. For setting up an absolute temperature scale one must first assign a numerical value to one fixed temperature. For this, the triple point of water has been chosen, i.e. the temperature at which solid, liquid and gaseous water are all in equilibrium. The triple point is defined to be 273.16 K where K is read for kelvin (after Lord Kelvin). This temperature is 0.01 °C on the Celsius scale ($^{\circ}\text{C}$) and is thus very close to the melting point of ice. Suppose the pressure and volume of a mass of gas are measured (i) at the triple point of water giving (pV)_{tr} as the product of the pressure and volume and (ii) at any unknown temperature T K, giving (pV) as the product. Then the absolute temperature T K is defined by

$$T \text{ K} = 273.16 \frac{(pV)}{(pV)_{tr}}$$

It is to be understood that the gas pressure is very low. The nature of the gas is immaterial. More subtly it can be shown that the temperature so defined is identical with that derived in a rather abstract way in the science of thermodynamics. The absolute scale is therefore also called the thermodynamic scale. Absolute temperatures can be obtained from Celsius temperatures by adding 273.15, thus the absolute temperature of melting ice is 273.15 K. Conversely absolute zero is a temperature 273.15 K below the temperature of melting ice, i.e. -273.15 °C. Theory shows that absolute zero is unattainable but it has been approached to within about 1 millionth of a degree. Within ten or so degrees of absolute zero matter develops some remarkable properties. See Kelvin Cryogenics Superconductor Helium.

Absolution an ecclesiastical term denoting the liberation of a person guilty of sin from its consequences by the act or intercession of religious authority.

Abstract Art a term applied to 20th cent. plastic arts in which form and colour possess aesthetic value apart from the subject. Usually represented as a modern movement beginning with Cézanne. The idea is ancient, abstract design being found in the Neolithic period in folk art and particularly in Moslem art (which forbids naturalistic representations especially of the human figure). Among those in the tradition are Kandinsky, Braque, Mondrian, Calder.

Acetic Acid an organic acid produced when ordinary (ethyl) alcohol is fermented by the organism called *Acetobacter aceti*. The same oxidation process yields vinegar, this is a weak and crude solution of acetic acid obtained by trecking dilute alcoholic liquor over beech wood shavings at 35 °C. The souring of wine is due to the same process. Acetic acid is used as a food preservative and flavouring material and in the manufacture of cellulose acetate and white lead.

Acetylene a compound of carbon and hydrogen prepared from calcium carbide and water. A very reactive gas it is used industrially on a large scale to prepare acetaldehyde, chloro hydrocarbon solvents and many intermediates for plastics manufacture. Burns in air with a highly luminous flame formerly used for lighting purposes, but is now widely used with oxygen in welding. For safe storage and transportation it is dissolved in acetone.

Acids substances having a tendency to lose a positive ion (a proton). This general definition overcomes difficulties of earlier views which merely described their properties and asserted that they are chemically opposite to bases. As a whole acids contain ionisable hydrogen, replaceable by a metal to form a salt. Inorganic acids are compounds of non metals or metalloids e.g. sulphuric, phosphoric acid. Carboxylic acids contain the group -COOH. FE2

Acolyte one who assists the priest at Mass by saying the responses and by waiting on him.

Act of God, a natural catastrophe that could not be foreseen or averted.

Advent, a period devoted to religious preparation for the coming celebration of the Nativity (Christmas). It comprises four Sundays, and commences on the one nearest to St Andrew's Day (Nov. 30). Advent was not observed before the 4th cent.

Advocatus Diaboli (the devil's advocate) a Roman Catholic functionary who presents opposing evidence in regard to the life of any deceased person it may be proposed to canonise.

Aeolian Harp a musical instrument once very popular. It consists of catgut stretched over a wooden sound box which when placed out of doors in the wind can be made to emit many pleasing harmonies.

Aerenchyma Plant tissue which is spongy because there are large air spaces between the cells in which gases can circulate. This aerenchyma tissue is characteristic of marsh and water plants.

Aerodynamics, the science of gas (especially air) in motion, particularly in relation to aircraft (aeronautics). The idea of imitating the birds by the use of wings is of ancient origin. Leonardo da Vinci first carried out experiments in a scientific manner. The invention of the balloon in 1783 and the researches of scientists and engineers in the 19th cent. ultimately led to the development of the aeroplane.

Aerolites the name given to the class of meteorites composed chiefly of heavy silicates. The other two main classes are *siderolites* (nickel-iron and silicates) and *siderites* (nickel-iron).

Aerosol a suspension of a liquid in a gas. For example a fog is very small drops of water suspended in air. Formed by spraying the liquid in air aerosols are used to disperse liquids over a wide area in crop spraying, air freshening and pest control.

Afrikaner type of cattle bred in South Africa.

Afrikaner an Afrikaans speaking South African usually of Dutch descent.

After damp occurs in a mine after an explosion causing suffocation. It is composed mainly of carbon dioxide and nitrogen and contains water vapour and carbon monoxide produced by the burning in a restricted supply of air of fine coal dust.

Agape a love feast held by the early Christians in commemoration of the Lord's Supper. See 332 (1).

Agar agar a vegetable jelly obtained from seaweeds widely used in jellies, canned meat and poultry and as a constituent in medicinal and cosmetic preparations. Used by bacteriologists to solidify broth and blood upon which bacteria are cultivated. Chief sources of supply Far East and California.

Agaric large fungi of the family *Agaricaceae* which includes the mushroom and what are popularly called toadstools. Though the idea that these two lay terms sharply differentiate between edible and poisonous fungi is an incorrect one. Characteristic of the agarics is the presence of a cap or *pileus* (bearing underneath the spore-shedding gills) and a stalk or *stipe*.

Agate a variety of chalcedony. Parallel bands of colour are often characteristic. Germany, Brazil and India furnish the main supplies and Scotland has a species of agate called Scotch pebble.

Agave the American aloe or Century Plant which sometimes does not attain to flowering maturity under sixty or seventy years, and then dies. The flower spray may reach a height of 20 feet and in its development the rush of sap is so great that the Mexicans collect for brewing the strong spirit called mescal. 1 000 litres of sap can be obtained from a single plant. Some species of agave yield sisal used for making cord and rope.

Agnus Dei (Lamb of God) a short anthem said or sung at a certain point of the Roman Catholic Mass or Anglican communion service. (John 1 29).

Air is a mixture of gases forming the atmosphere we breathe. Nitrogen, oxygen and argon are always present in air. A typical sample of dry air might contain these gases in the following proportions (by volume): nitrogen, 78.06%, oxygen 21%, argon, 0.94%. A small quantity of carbon dioxide is present, about 3 parts in 10 000 parts of air. This carbon dioxide is the source of carbon compounds built up by green plants in photosynthesis (F28). In the process carbon dioxide is absorbed from the air and oxygen returned the reverse of the respiratory process of animals. Air also contains a quantity of water vapour and traces of ammonia, nitrogen oxides, hydrogen, sulphur dioxide, hydrogen sulphide, ozone and of the rare gases helium, krypton, neon and xenon. In a city smoke and dust particles may be as abundant as 100 000 particles per cc. A litre of air at 0°C and 700 mm pressure weighs 1.2932 grams. See also Atmosphere, Pollution.

Alabaster a soft crystalline form of sulphate of lime or granulated gypsum easily worked for statuary and other ornamental articles, and capable of being highly polished. Volterra, in Tuscany, yields the finest. That in highest ancient repute came from Alabastron in Egypt, near to the modern Antinoë.

Alb white vestment reaching to the feet, worn by priests in religious ceremonies.

Albatross a large sea bird of almost pure white black and white or brown plumage. It nests in colonies on remote islands but at other times rarely approaches land. Of the thirteen species nine are found in the southern oceans, one in the tropics and the three others in the North Pacific.

Albert Memorial, a large Gothic monument designed by Sir George Gilbert Scott and embellished with sculptures by eminent artists. Erected in memory of Prince Albert in Kensington (arrives at a cost of £1,000,000).

Alcázar the palace at Seville famed for the beauty of its hall and gardens in its site is the residence of the Moorish kings.

Alcohols A class of organic compounds of general formula $R-OH$ where R is a hydrocarbon radical. Alcohol is the name used for ethyl alcohol (ethanol) which is produced by distilling fermented liquors and is used for medicinal and industrial purposes. It is a product of petroleum cracking. Industrially ethyl alcohol is used in the manufacture of chloroform, ether, acetone, etc. Distilled with water it forms a constant boiling mixture of ethyl alcohol and water. The density of ethyl alcohol is 0.79 g/cm³ at 15°C. It is used for medicinal purposes, while the methyl and ethyl alcohols are used for industrial purposes. The methyl alcohol is used for the production of formaldehyde and for the production of acetic acid. The ethyl alcohol is used for the production of ethyl acetate and for the production of ethyl ether.

Alcoholic Strength In the British system the strength of spirits is measured in terms of the volume of alcohol in a given volume of liquid. In Europe the strength of spirits is usually measured by the (at 15°C) hydrometer. In the U.S.A. because of the smaller gallon 127 U.S. proof gallons = 1 British proof gallon. In Britain the alcoholic content of spirits and liquors appears on the bottle. For example, 40% proof spirit contains 20% alcohol or about 40% per cent. The alcoholic content of wines is not shown on the label.

Aldehyde the generic term for a class of chemical compounds of general formula $R_2C=O$ where R is an organic radical. Except for formaldehyde, which is a gas, aldehydes are volatile liquids. They are produced by oxidation of primary alcohols. Most important aldehyde is formaldehyde used in making the plastics described as formaldehyde resins. Formaldehyde solution (water) is much used for preserving zoological specimens.

Alder a river side tree of the genus *Alnus* including some 20 species and found in north temperate regions and the Andes. The only species native to Britain is *A. glutinosa* which has been described as guardian of river banks because of the way its roots bind together the sand and stones, and so slow down erosion. The wood is used for furniture and charcoal.

Alidie Editions are the beautiful books printed in Venice by the Renaissance printer Aldo Pio Manuzio and his family between 1490 and 1597. Italics were first introduced in these books.

Algae, flowerless plants living mostly in water. Seaweeds and the green pond scums are the best known algae. The green powder found on trees is composed of a microscopic alga (*Protococcus*).

Algebra, a branch of mathematics in which symbols are used in place of numbers. Sir Isaac Newton styled it the "universal arithmetic." The Chinese were able to solve the quadratic equation before the Christian era but it was Al Khwarizmi an Arab mathematician of the early 9th cent. who introduced algebra to Europe.

Alhambra, the ancient palace of the Moorish kings at Granada in Spain, built in the 13th and 14th cent. Though part of the castle was turned into a modern palace under Charles V., the most beautiful parts of the interior are still preserved—the graceful halls and dwelling-rooms grouped round the Court of Alhambra and the Court of Lions, with their fountains, arcades and lovely gardens.

Aliphatic describes derivatives of hydrocarbons having chains of carbon atoms, as distinct from rings of carbon atoms as in benzene (see Aromatic). The gas butane is aliphatic.

Alkal, the general name given to a number of

chemical, which are bases (*q.v.*) The term should be limited to the hydroxides of metals in the first and second group of the periodic table and of ammonia *e.g.* NaOH KOH. They are used commercially in the manufacture of paper glass soap and artificial silk. The word comes from the Arabic *al kali* meaning calcined wood ashes. Alkalies are extremely soluble in water and neutralise acids to form salts and water.

Alkaloids a large group of natural products which contain nitrogen they are usually basic. Isolated from plants and animals they include some hormone vitamins and drugs. Examples are nicotine adrenalin and cocaine. Many alkaloids are made synthetically for medicinal use *e.g.* morphine quinine. Their function in plants is not well understood. *See* Belladonna.

Alligator the crocodile of America, common in the lower Mississippi and adjacent lakes and marshes varying in length from 2 to 20 feet.

Alloys are combinations of metals. They are made because of their valuable special properties *e.g.* durability strength lightness magnetism rust resistance etc. Some well known ones are brass (zinc + copper) coinage bronze (copper + zinc + tin) steels (iron + carbon + various other materials) soft solder (tin + lead) dental fillings (mercury + various ingredients).

All Saints Day (Nov 1) is common to both the English and Roman Catholic Churches and is in commemoration of the saints generally or such as have no special day set apart for them. Instituted by Pope Boniface IV early in the 7th cent. this ecclesiastical festival was formerly called All Hallows.

All Souls Day (Nov 2) is a festival of the Roman Church intended for the mitigation by prayer of the sufferings of souls in purgatory. The commemoration was enjoined by Abbot Odilo of Cluny during the 11th cent. upon the monastic order over which he presided and was afterwards adopted generally throughout the Roman Communion.

Allspice, a flavoured obtained from a West Indian tree of the myrtle family *Prunella officinalis*. The essential oil of its unripe fruit is a powerful irritant and the bruised berries are carminative.

Alkylum, accumulations of sand mud gravel etc. washed down by rivers and forming distinct deposits.

Almond, the fruit of the *Amygdalus communis* originally indigenous to Persia, Asia Minor and N Africa now cultivated in Italy Spain France the U.S.A. and Australia. It yields both bitter and sweet oil. Bitter almond oil is obtained by macerating and distilling the ripe seeds. It is used for flavouring and scenting purposes its fragrant odour being due to the presence of benzaldehyde and hydrogen cyanide. When the seeds are pressed sweet almond oil results. This is used in perfumery and also as a lubricant for very delicate machinery.

Almuce, a fur stole worn by certain canons.

Aloe, large plants of the lily family with about 180 species found mainly in the S African veldt and Karroo. The bitter purgative drug (aloes) is prepared by evaporating the plant's sap. *See* Agave.

Alpaca, a South American ruminant related to the llama whose long fine wool is woven into a soft dress fabric known by the same name. Sir Titus Salt first manufactured alpaca cloth (1836). Saltaire near Bradford, remains to evidence the success which for many years attended the enterprise.

Alpha Particle, or alpha ray fast-moving helium nucleus ejected by some radioactive atoms *e.g.* polonium. It is a combination of 2 neutrons and 2 protons. *See* FII (1).

Alphabet (so called from the first two letters of the Greek alphabet—alpha beta) is the term applied to the collection of letters from which the words of a language are made up. It grew out of the knowledge that all words can be expressed by a limited number of sounds arranged in various combinations. The Phoenicians were the first to make use of an alphabetic script derived from an earlier Semitic alphabet (earliest known inscriptions c. 1500-950 B.C.) from which all other alphabets have sprung. The stages in the development of the alphabet were mnemonic

(memory aids) pictorial (actual pictures) ideographic (symbols) and lastly phonetic. All the ideographic systems died out with the exception of that of the Chinese.

Altimeter an instrument used in aircraft to estimate altitude. Its usual essential feature is an aneroid barometer which registers the decrease of pressure with height. Roughly 1 millibar corresponds to 30 ft. To read an aircraft altimeter correct for its destination the zero setting must be adjusted for difference of ground height and difference of surface pressure especially when pressure is falling or when flying towards low pressure.

Altitude an astronomical term used to signify the angular elevation of a heavenly body. This is measured with a quadrant or sextant. In aeronautics, it is the height (in feet or metres) above sea level.

Alto Relievo a term applied to sculptured designs which are depicted in prominent relief on a flat surface technically signifying that the projection exceeds one half the true proportions of the objects represented. Bas-relievo is carving less than one half such projection.

Alum is a compound salt used in various industrial processes especially dyeing its constituents being the sulphate of one univalent metal or radical (*e.g.* potassium sodium ammonium rubidium caesium silver thallium) and the sulphate of a tervalent metal (*e.g.* aluminium iron chromium manganese) and water of crystallisation.

Alumina is the oxide of aluminium. Very valuable as a refractory material. The ruby is almost 100 per cent alumina, so also are the emerald oriental amethyst etc. An hydrated aluminium oxide is bauxite, chief ore of aluminium from which the metal is extracted electrolytically.

Aluminium is a light metal which conducts electricity well. Its specific gravity at 20°C is 2.705. Melting point of aluminium is 660.2°C. It is made commercially by electrolysis of bauxite dissolved in cryolite (double fluoride of aluminium and sodium). Aluminium alloys because of their strength and lightness are being increasingly used for the construction of rail way coaches, automobiles aeroplanes etc.

Amadavat, a popular cage bird of the weaver family mainly crimson with white spots so named because the first specimens came from Ahmadabad in India about 1700.

Amalgam is the term applied to any alloy of which mercury forms a part.

Amber a brittle resinous substance in origin, fossilised resin. Obtained mostly from the Baltic coasts and used for ornaments pipe mouth pieces, etc.

Ambergris is a waxy substance produced in the intestines of the sperm whale and generally found floating on the sea. It is a valuable perfumery material.

Amblyopsis, a species of fish practically sightless, and with inoperative organs of hearing and feeling that inhabit the Mammoth Cave of Kentucky. A remarkable illustration of the failure of senses not brought into use.

America's Cup a prize trophy first offered in 1851 by the Royal Yacht Squadron and open to yachts of all nations. It was won in the first year by the America, a New York yacht and has remained on that side of the ocean ever since despite attempts to recapture it by Lord Dunraven, Sir Thomas Lipton Mr T. O. M. Sopwith and others. The last attempt by Great Britain was in 1964 when *Sovereign* was beaten by the American *Constellation*. Another attempt is to be made in 1973. Australia challenged in 1962 with *Gretel* and in 1967 with *Dame Pathe* but unsuccessfully. *See* also U32(2).

Amethyst, the violet variety of quartz used as a precious stone containing traces of manganese titanium, and iron. The finest coloured specimens come from Brazil and the Ural.

Amioe a linen vestment worn about the neck by Roman and many Anglican priests over the surplice when officiating at Mass or Holy Eucharist. Formerly worn on the head by priests and pilgrims.

Amines, organic chemicals composed of carbon, hydrogen and nitrogen. They are derived from ammonia, which they resemble in smell and chemical characteristics. The smell of bad fish

is due to the presence of amines. Important industrially as intermediates in a wide variety of products for example the synthesis of dyestuffs and man made fibres such as nylon.
Amino acids organic compounds containing an amine group and an acid group. They are the building bricks of proteins (q.v.) See F27(1) 29

Ammeter an instrument for measuring the current flowing in an electric circuit. A contraction of ampere meter. See Ampere

Ammonia a colourless gaseous compound comprising three atoms of hydrogen to one of nitrogen. Formerly it was made by heating the horns and hoofs of deer acquiring the name of spirits of hartshorn. The ammonia of commerce is now procured by coal decomposition in the course of gas-making and by direct synthesis. In the very important Haber process of ammonia production by fixation of atmospheric nitrogen, the nitrogen is made to combine with hydrogen and the ammonia so prepared is converted into nitric acid, ammonium nitrate or ammonium sulphate. The Haber process made Germany self-sufficient in nitrates in the first world war and was afterwards exploited all over the world.

Ammonites extinct animals related to the Nautilus. The chambered shell is coiled usually in a plane spiral and they are confined to Mesozoic rocks.

Ammonium the basic radical of ammonium salts. Composed of one atom of nitrogen and four of hydrogen it behaves chemically like an ion of a monovalent alkali metal. Ammonium chloride is known as sal ammoniac. Sal volatile is ammonium carbonate.

Amnesty an act of grace by which a ruler or governing power pardons political offenders.

Amorphous, a term used to indicate the absence of crystalline form in any body or substance.

Ampere unit of electric current in the SI system of units named after André Marie Ampère who in the 1820s helped to lay the foundations of modern electromagnetism. Defined as that constant current which if maintained in two parallel rectilinear conductors of infinite length of negligible circular cross section and placed at a distance of one metre apart in a vacuum would produce between these conductors a force equal to 2×10^{-7} newton per metre length.

Amphibia. See F33(2)

Amphioxus or Lancelet, a primitive chordate occurring in sand banks around British shores and elsewhere.

Ana, a collection of criticisms, observations or opinions about a particular person, place or subject. Used as a suffix especially applies to a person's memorable sayings, anecdotes about or publications bearing on as in *Jamaicaniana*.

Alexandrina *Victoriana*

Anabolism See Catabolism.

Anarchism. See J3

Anchor an instrument used for keeping ships stationary. Great improvements have been introduced in recent years, stockless anchors being now chiefly used, consisting of a shank and a loose fluke. Lloyd's rules prescribe the number and weight of anchors which must be carried by merchant ships.

Anchorite a religious person who retires into solitude to employ himself with holy thoughts. Among the early Christians anchorites were numerous, but in the Western Church they have been few. Their reputation for wisdom and prescience was high, and kings and rulers in olden days would visit their cells for counsel. An anchorite or "ancret" was in medieval times a source of fame and profit to the monastic house within which he was voluntarily immured.

Anchorv, a fish of the hering family distinguished by its large mouth and projecting snout plentiful in the Mediterranean and much esteemed when cured.

Ancient Lights are rights of light enjoyed by a property owner over adjoining land. Such a right is obtained either by uninterrupted enjoyment for twenty years or by written authority and once legally established cannot be upset no building being permissible that would seriously interfere with the privilege.

Anemometer an instrument for measuring the strength of the wind. In the most widely used

pattern the rotation, about a vertical axis, of a group of hemispherical or conical cups gives a measure of the total flow of air past the cups, various registering devices being employed. The Dines anemograph provides a continuous record of the variation in both velocity and direction changes of pressure, produced in a horizontal tube kept pointing into the wind by a vane cause a float to which a pen is attached to rise and fall in sympathy with the gusts and lulls. The recently devised hot wire anemometer depending upon the change of electrical resistance experienced by a heated wire when cooled enables very gentle air currents to be investigated.

Aneroid is the kind of barometer which does not depend upon atmospheric support of a mercury (or other liquid) column. It consists of a metallic box, partially exhausted of air with corrugated lid which moves with atmospheric changes. A lever system magnifies the lid movements about 200 times and atmospheric pressure is read from a dial. The construction of the vacuum chamber provides automatic compensation for temperature changes. An aneroid barometer is the basic component of an altimeter.

Angelica, an aromatic plant of the Umbelliferae order. *Angelica officinalis* valuable as a flavouring and possessing medicinal properties. In olden times supposed to protect against poison.

Angelic a church bell rung in Roman Catholic countries at morn, noon and sunset to remind the faithful to say their Angelic Salutation.

Angwin Dynasty includes the Plantagenet kings from Henry II to Richard II. The name was derived from Henry II's father Geoffrey Count of Angou.

Angles a northern tribe originally settled in Schleswig who with the Saxons and Jutes invaded Britain in the 5th cent.

Angstrom a unit of wavelength named after the Swedish physicist A. J. Angstrom (1814-74) equal to one hundred millionth of a centimetre (10^{-8} cm). It is used to measure wavelengths of light X rays etc.

Aniline a simple aromatic compound related to benzene and ammonia. It is obtained from coal tar. The name recalls the fact that it was first prepared by distilling indigo (now a Portuguese for indigo). In 1858 W. H. Perkin (1838-1907) discovered the first aniline or coal tar dye, mauve and thus founded the modern dyestuff industry.

Animal Kingdom. See F32

Anise, an umbelliferous plant (*Pimpinella anisum*) found in Egypt and the Levant and valued for its fruit aniseed possessing certain medicinal properties and yielding an aromatic volatile oil. Also used in cooking. The anise of the Bible is *Andropogon graveolens* &c. diff.

Annates were acknowledgments formerly paid to the pope by way of fee or tax in respect of ecclesiastical preferment, and consisted usually of a proportion of the income ("first-fruits") of the office. Introduced into England in the 13th cent. annexed to the Crown under Henry VIII transferred to a perpetual fund for the benefit of the poorer clergy in 1704. See Queen Anne's Bounty.

"Annals Register" a yearly record of political and literary events, founded by Edmund Burke (as editor) in 1759 and Robert Domsley the bookseller.

Annunciation, Feast of the (March 25) is a church festival commemorating the message of the incarnation of Christ brought by the angel Gabriel to the Virgin Mary hence the title Lady Day.

Anointing is the pouring of consecrated oil upon the body as a mark of supreme honour. In England it is restricted chiefly to the ceremony of the monarch's coronation, and the spoon with which the oil is applied forms part of the English regalia. In the Roman Catholic Church anointing represents the sacrament of extreme unction.

Ant. There are about 6 000 species of ants, which belong to the same order (Hymenoptera) as the bees, wasps, and ichneumon flies. They are social in habit living in communities of varying size and development. There are three basic castes in ants—the females or *queens*, the males and the *workers* (the last-named being neuter) although specialised forms of workers

are sometimes found *eg* the *soldiers* of the harvesting ants & the communities of those species of ants which evolved most recently there is a highly complex social life and well developed division of labour. Some species of these ants make slaves of other species stealing the cocoons before the adult forms emerge. Many ants mill greenflies which they protect for their honey like secretion and most ants nests contain many guests such as beetles and silver fish. Some ants harvest crumbs of corn and other from S. America live on fungi which they cultivate in underground mushroom beds.

Antarctic Exploration In earlier centuries it was thought that a great continent must exist in the southern hemisphere around the South Pole to balance the known land masses in the north. Its supposed extent was greatly reduced in the 18th cent. particularly when Capt Cook sailed for the first time south of the Antarctic Circle and reached the edge of the ice pack. A portion of the ice-covered continent—the coast of Graham Land—was first sighted by Lieut Edward Bransfield in 1820. Explorers of several other nations sighted portions of the coast line in other quarters but the first extensive exploration was made by Capt James Clarke Ross who with the *Erebus* and *Terror* penetrated into the Ross Sea in 1841 and discovered the great Ross Ice Barrier in 78° South lat. Interest in the Antarctic did not revive until after 1890 when an international scheme of research was drawn up. A Norwegian, C. E. Borchgrevink, in 1898–1900 was the first to winter in the Antarctic and to travel on the ice barrier. The British share in this work was carried out by Capt R. F. Scott's expedition in the *Discovery* 1901–4. Scott's party sledged across the barrier to 82° 17' South then a record farthest south. A little later Ernest Shackleton beat this by travelling to within 100 miles of the South Pole. In 1910 Scott organised his second expedition of the *Terra Nova* and became engaged against his will in a race for the Pole when after his departure the Norwegian Arctic explorer Roald Amundsen suddenly announced that he was sailing for the Antarctic. Amundsen set up his base at the eastern end of the Barrier and relying on dog teams for hauling his sledges reached the Pole on December 14 1911. Meanwhile Scott and his party their start delayed by adverse weather were marching southwards man hauling their sledges for Scott was against the use of dogs. After an arduous journey they reached the Pole one month after Amundsen. The return was a struggle against the weather and increasing weakness, probably due to scurvy until at last they perished within a few miles of their base. After the First World War the development of the whaling industry greatly stimulated further exploration. Outstanding expeditions included that of Admiral R. E. Byrd 1929 when he flew over the South Pole. The British Graham Land expedition, 1934 which carried out the first extensive mapping of any part of the Antarctic continent and the U.S. Navy's Antarctic Expedition of 1940 when the whole continent was circumnavigated and great areas photographed from the air. In recent years valuable work has been done by the first International expedition the Norwegian-British-Swedish Expedition to Queen Maud Land and by the French in Adélie Land. The Falkland Island Dependencies Survey set up during the war has continued the scientific exploration of Graham Land. The Antarctic was the scene of high adventure during the International Geophysical Year (1957–58) when scientists from many countries participated in the explorations. The Commonwealth Trans-Antarctic Expedition set out from opposite sides of the continent and met at the South Pole, the U.K. party led by Sir Vivian Fuchs, from the Falklands, and Sir Edmund Hillary and his party from New Zealand. The U.K. party accomplished the first crossing of the White Continent in 99 days. Their scientific work included the making of seismic and complementary gravimetric studies at frequent intervals along the 2,200-mile traverse. Since the Antarctic is becoming important for

many reasons in weather forecasting in the whaling industry and as a possible centre for world air routes the tempo of exploration and research will become even faster in the future.

Anteater There are two unrelated families of anteaters the Myrmecophagidae and the Marmosidae. Among the former the Great Anteater (*Myrmecophaga jubata*) is the largest species over 6 ft in length occurring in Central and S. America. Only half its size is the lesser Anteater (*Tamandua tetradactyla*) this is found in forests of tropical America and Trinidad. The Two-toed Anteater (*Cyclops didactylus*) belongs to South America and Trinidad. These three animals live mostly on termites they are adapted to this diet having large claws for digging out ants and a tubular mouth with a long sticky tongue. The Marmosidae are the Scaly Anteaters or Pangolins widely distributed over Africa and the Orient. The difference between the two families is that the first has hair covering the body the latter has horny scales instead. Antennae paired feelers of insects and crustacea. Anthem a choral composition with or without instrumental accompaniment usually sung after the third collect in the Church of England service. The words are from the Scriptures and the composition may be for solo voices only for full choir or for both. Among the chief British composers of anthems are Tallis, Purcell, Croft, Boyce, Goss and Stainer.

Anthracite is a black coal with a brilliant lustre. It contains 92% and over of carbon and burns slowly without smoke or flame. See Coal.

Anthropoid meaning resembling man a sub-order of the primate mammals including man and also the gibbon, chimpanzee, orang utan and gorilla.

Antibiotics See Index to Section P.

Anticyclone a region where barometric pressure is greater than that of its surroundings. Such a system is distinguished on weather charts by a pattern of isobars usually circular or oval shaped enclosing the centre of high pressure where the air is calm. In the remaining areas light or moderately strong winds blow spirally outwards in a clockwise direction in the Northern Hemisphere (and in the reverse direction in the Southern Hemisphere) in accordance with Buys Ballot's law (an observer with back to wind in Northern Hemisphere has lower pressure to left in Southern to right). Over the British Isles anticyclonic weather is generally quiet and settled being fair, warm and sunny in summer and either very cold and often foggy or overcast and gloomy in winter. These systems move slowly and sometimes remain practically stationary for days at a time that over Siberia being particularly well defined. Extensive belts of almost permanent anticyclones occur in latitudes 30° N and 30° S. Persistent anticyclonic weather with easterly winds during the months December to March 1962–3 brought the coldest and hardest winter to Britain since 1740 (taking the Midlands as representative).

Antimony Metal element symbol Sb. In group V of the periodic table. Exists in various forms the stable form being a grey brittle metal with a layer structure. The other forms are non-conductors. On being burned it gives off dense fumes of oxide of antimony. By itself it is not of special utility but as an alloy for hardening other metals it is much used. As an alloy with lead for type metal and with tin and copper or zinc for Britannia metal it is of great value. Most important antimony ore is stibnite (antimony sulphide).

Anti-Pope, one elected in opposition to one held to be canonically chosen commonly applied to the popes Urban VI and Clement VII who reigned at Avignon during the Great Schism (1378–1417).

Anti-proton the negative proton "an atomic particle created in high energy collisions of nuclear particles. Its existence was confirmed in Oct 1955. See P14.

Antisemitism. See J4.

Antlers are the branched horns of deer the branches being called tines. Antlers originate as outgrowths of the frontal bone, and are usually shed once a year. Except in the reindeer and caribou they are restricted to the male

Apartheid See 35.

Ape a term applied to the gorilla chimpanzee orang utan and gibbon—the anthropoid apes.
Apellion the point in the orbit of a planet farthest from the sun, the opposite of perihelion

Aphids See T29 (2).

Apis, the sacred bull worshipped by the ancient Egyptians also the scientific name for the bee.
Apocalyptic writings are those which deal with revelation and prophecy more especially the Revelation of St John

Apocrypha (hidden writings) the books which were included in the Septuagint (Greek and Vulgate (Latin) versions of the Old Testament but excluded from the sacred canon at the Reformation by the Protestants on the grounds that they were not originally written in Hebrew or regarded as genuine by the Jews. The books include 1 and 2 Esdras Tobit Judith 3rd additions to Esther Wisdom of Solomon Ecclesiasticus Baruch Song of the Three Holy Children History of Susannah Bel and the Dragon Prayer of Manasses 1 and 2 Maccabees. The term is usually applied to the addition to the old Testament but there are also numerous Christian writings of the same character. *The New English Bible* with the Apocrypha is published in 1970

Apogee that point in the orbit of a heavenly body which is farthest from the earth used in relation to the sun moon and artificial satellites. The sun's apogee corresponds to the earth's apellion See Perigee

Apostasy as a revolt by an individual or party from one form of opinions or doctrine to another Julian the Roman Emperor (331-63) brought up as a Christian became converted to paganism and on coming to the throne (361) proclaimed religious toleration Hence his name John the Apostate

Apostles The twelve apostles who were disciples of Jesus were Simon Peter and Andrew (his brother) James and John (sons of Zebedee) Philip Bartholomew Thomas Matthew James Thaddaeus Simon and Judas Iscariot. After the Ascension Matthias was chosen to take the place of Judas. St Paul is always referred to as the chief apostle though he is not one of the twelve. St Barnabas has also been called an apostle

Apostles' Creed, applied to the most ancient of the Church's statements of its belief "I believe in God the Father Almighty and in Jesus Christ his only Son our Lord who was born of the Holy Ghost and was born of the Virgin Mary. A later version is used in the Church of England at morning and evening prayer

Apostolic Fathers were the immediate disciples or followers of the Apostles especially such as left writings behind. They included Barnabas Clement of Rome Ignatius of Antioch Hermas Papias of Hierapolis and Polycarp

Appeasement Policy The name of the policy during 1937 and 1938 of yielding to the demands of Hitler and Mussolini in the hope that a point would be reached when the dictators would co-operate in the maintenance of peace. The policy culminated in the Munich Agreement (which was the subject of much criticism) after a series of concessions including the recognition of the Italian conquest of Abyssinia and the German annexation of Austria. The policy was finally demonstrated as futile when Hitler seized Czechoslovakia in March 1939

Appian Way the oldest and finest of the Roman roads originally laid by Appian Claudius (312 B.C.) from Rome to Capua and thence to Brundisium (Brindisi)

Approved Schools were residential schools, subject to Home Office inspection, for the training of young persons under 17 who because of disturbed behaviour as a result of unfavourable influences such as bad environment or parental neglect were guilty of offences or in need of care and protection and had been sent to them by magistrates from juvenile or other courts. The approved school order was abolished by the Children and Young Persons Act 1969. Such young people may now be committed to the care of a local authority and accommodated in a system of community homes ranging from children's homes to borstal type institutions

April the fourth month of the year from the

Roman *Aprilis* derived from *aperire* "to open"—the period when the buds begin to open

Apse is a semicircular recess, arched or domed-roofed at the end of the choir aisles or nave of a church

Aqueducts are conduits by which water flows or is conveyed from its source to the place where it is to be used. Most famous builders were the Romans and the oldest Roman aqueduct was the Aqua Appia which dates from about 310 B.C. Among modern aqueducts may be mentioned that of Glasgow which brings water to the city from Loch Katrine that of Manchester which takes Thirlmere that of Liverpool which takes Thirlmere that of York which takes the Eborac Aqueduct which carries water from the Foss Valley to Humberston. **Arcades** the term applied to the elaborate decoration based on flowing lines used in Moorish art

Arabian Nights a collection of fascinating tales of the Orient of medieval Indian Persian Arab and Egyptian origin and first made known in Europe by Antoine Galland a French Orientalist whose original translation was called *The Thousand and One Nights*

Arabic Numerals The modern system of numbering 0 1 2 3 4 5 6 7 8 9 in which the first depends on their position for their value is called the Arabic numeral system. The method is in fact of Indian origin. By the 9th century Hindu science was available in Arabia and the Persian mathematician Al Khwarizmi (c. 850) in his *al-jammi* used the system

Arabic system of numbering gradually the method spread to Europe taking the place of the Roman system which was useless for calculation. The West is indebted to the Arabs for the zero symbol the lack of which had been a serious drawback to Greek mathematics. It made the invention of decimal fractions possible. **Argonite** the unstable form of calcium carbonate found as a mineral in some young deposits. It crystallises in the orthorhombic system but tends to revert to calcite (q.v.)

Aramaic Languages, the Semitic dialects current in Mesopotamia and the regions extending south-west from the Euphrates to Palestine from about the 12th cent. B.C. until after the rise of Islam when Aramaic was superseded by Arabic. Both Aramaic and Greek were spoken in Palestine during the time of Christ

Archaeopteryx, a fossil bird providing a connective link between reptiles and birds. It had feathers jaw with teeth, no bill, reptilian bones and skin a long tail and it probably used its fore-limbs for gliding flight. The first specimen found in 1861 in the Solenhofen Limestone of Bavaria is in London's Natural History Museum

Archbishop the chief of the bishops of an ecclesiastical province in the Greek Roman and Anglican churches. In the Church of England there are two archbishops, the Archbishop of Canterbury called the Primate of all England and the Archbishop of York, styled the Primate of England

Archimedes' Principle. When a body is weighed in air and then in any fluid, the apparent loss in weight is equal to the weight of fluid displaced. This scientific fact was noted by the Syracusan philosopher Archimedes (287-212 B.C.) and is frequently used as a basis for density measurements

Architecture, the art and science of building. The provision of shelter for mankind by the orderly arrangement of materials in a manner which expresses man's attitude to living. The form which buildings take are the outcome of the function for which they are to be used of the architect's aesthetic sensibility and of the structural method adopted. Until the last hundred years structural methods were limited to timber frames and columns lintels, load bearing walls arches vaults and domes in brick or stone. From these few basic elements have evolved the great variety of historic styles of building to be found throughout the world. To give but one example the Greeks created those systems of decorated columns and beams, known as the Orders, which were adopted by the Romans, revived decoratively rather than structurally during the Renaissance and are still used in debased form on the more presumptuous type

of modern building. In recent years however architecture has taken on a new meaning. Once confined to the rich in the form of Church, State or Commerce it is now with the coming of democracy recognised as an essential social service for all. This, and the development of new structural techniques and materials (steel, aluminum, sheet glass, reinforced concrete, plastics, and plywoods to name a few) have made the interest in historic styles the mainstay of the older architect of secondary importance. Modern architecture is the creation of buildings with the highest possible standards of functional performance in terms of efficient planning and structure, good artificial and natural lighting, adequate heating or cooling and proper acoustic conditions consistent with the price the client can afford to pay. At the same time the architect's task is to design a structure and the space the structure delimits internally and externally which are aesthetically stimulating and satisfying and well related to the land and buildings around it.

Arctic Exploration. Modern exploration of the Arctic begins in the 16th cent. when men sought to reach the East Indies by sailing through the Arctic to the Pacific Ocean. The North-east Passage via the shores of northern Asia was the first attempted. In 1553 and 1554 the English navigators Sir Richard Chancellor and Stephen Burrough sailed into the White Sea but were prevented by storms and ice from advancing farther eastwards. The project was later revived by the Dutch. Barentius in 1594 discovered Spitsbergen but also failed to get beyond Novaya Zemlya. It was not in fact until 1879 that the Swede A. E. Nordenskiöld in the *Vega* succeeded in reaching the Pacific. The attempts to find a North-west Passage were more numerous and determined. In 1535 John Davis penetrated Davis Strait and coasted along Baffin Island. Hopes ran high when Henry Hudson discovered Hudson Bay in 1610 but a practicable passage continued to elude explorers. The problem was to find a navigable route through the maze of channels in the short summer season and to avoid being frozen in with supplies exhausted. After the Napoleonic Wars the Admiralty sent out many naval expeditions which culminated in Sir John Franklin's expedition with the *Erebus* and *Terror* in 1845. The ships were beset by ice in Victoria Channel and after Franklin's death were abandoned by their crews, who perished from scurvy and starvation on their march southwards. To ascertain their fate several further expeditions were despatched, and the crew of the *Investigator* commanded by R. J. M. Clure sailing eastwards from Bering Strait were the first to make the Passage though in doing so they were obliged to abandon their ship. It was thirty years before the Norwegian Roald Amundsen, succeeded in sailing the *Gjøa* from east to west. In the meantime the North Pole had become the goal of explorers. Nansen, in 1893, put the *Fram* into the ice pack to drift across the Polar basin and himself made an unsuccessful attempt on the Pole across the pack. This was eventually achieved by the American explorer Robert E. Peary who after several expeditions in the North Greenland region succeeded to the Pole with Eskimo companions in 1909. The next phase was the employment of airships and aeroplanes in Arctic exploration. In 1928 Admiral Byrd made the first flight over the Pole, and in the same year Amundsen and Lincoln Ellsworth flew the airship *Norge* from Spitsbergen to Point Barrow, Alaska. Two years later, the *Italia* commanded by the Italian, Nobile, was wrecked on a return flight from the Pole and Amundsen lost his life in an attempt to rescue the survivors. With modern developments in aircraft and navigation, flights over the Polar basin are almost a routine matter and passenger flights between Europe and America via northern Greenland are being pioneered. The first voyage under the North Pole was made in August 1958 by the American nuclear-powered submarine *Nautilus*.

Arenaceous Rocks, the rocks composed of grains of sand, chiefly sandstones, quartz is the most abundant mineral in these rocks.

Argillaceous Rocks are a sedimentary group including the shales and clays.

Argon, chemical element, symbol A. This was the first of the inert gases (*g*) to be isolated from air by Rayleigh and Ramsay in 1894. Argon is used for filling gas-filled metal filament electric lamps. In gas discharge tube it gives a blue glow.

Arithmetic the branch of mathematics that deals with numerical calculations as in counting, measuring, weighing. The early civilisations used simple arithmetic for commercial purposes, employing symbols and later letters of the alphabet as numerals. When Hindu-Arabic numerals replaced Roman numerals in the Middle Ages it meant a great step forward and led to rapid developments—the invention of logarithms, slide rule, calculating machines.

Ark of the Covenant was the sacred chest of the Hebrews and symbolised God's presence. It was overlaid with gold inside and outside. It accompanied the Israelites into battle and was once captured by the Philistines. Eventually it found a resting place in Solomon's Temple.

Armada, Spanish, the naval expedition fitted out by Philip II of Spain in 1588 against England, commanded by the Duke of Medina Sidonia. It comprised 129 ships, was manned by 8,000 sailors and carried 19,000 soldiers and more than 2,000 cannon. Against this formidable force Elizabeth had only 80 ships, manned by 9,000 sailors under Lord Howard of Effingham, under whom served Drake, Hawkins and Frobisher. The British Fleet awaited the Armada off Plymouth and at Tilbury there was a considerable defensive land force under the command of the Earl of Leicester. On July 19 the ships of the Armada were sighted off the Lizard, disposed in a crescent seven miles long from horn to horn. The excellent manoeuvring of the English, their fire-ships and a gale from the NW combined so effectively to cripple the Spanish ships that the Armada was scattered in confusion, a very small remnant contriving to reach home via the North of Scotland. It was impossible to embark the army of Parma waiting in the Netherlands. Elizabeth had a medal struck bearing in Latin the inscription: God blew and they were scattered.

Armadillo a genus of animals related to the sloths and anteaters belonging to South America and carrying a hard bony covering over the back, under which one species (*Tolypeutes*) can completely conceal itself when attacked, rolling itself up like a hedgehog.

Armageddon according to the Revelation of St. John the great battle in which the last conflict between good and evil is to be fought.

Armillary Sphere an early form of astronomical apparatus with a number of circles representing equator, meridian, ecliptic, etc. Used by Hipparchus and Ptolemy and up to the time of Tycho Brahe for determining the position of the stars.

Aromatic a term used by chemists originally to describe compounds like benzene having a characteristic smell. It is a term which implies a collection of chemical characteristics, the salient features being a flat ring structure and a general similarity to benzene.

Arsenic a metalloid element, symbol As, in group V of the periodic table, usually met with as a constituent of other minerals, sometimes by itself. Its compounds are very poisonous. Lead arsenate is a powerful insecticide used for spraying fruit trees. The more stable allotropic form (grey) has a layer structure and conducts electricity.

Artesian Wells take their name from Artois in France where the first wells of this kind were constructed in 1126. They are to be found only when a water-bearing bed is sandwiched between two impervious beds. When a boring is made to the lower part of the bed, the pressure of water is sufficient to cause the water to overflow at the surface. Artesian wells were known to ancient Egypt and China, and have existed in the Sahara since the earliest times. The fountains in Trafalgar Square are fed by artesian wells sunk through the London clay into the chalk about 400 ft.

Arthur's Seat, a hill of volcanic origin, 823 ft. high.

dominating Holyrood Park to the south east of Edinburgh

Articles The *Six Articles* are those contained in an Act of Henry VIII and were of Roman Catholic origin. The *Thirty-nine Articles* were drawn up for the English church at the Prayer Book. Candidates for holy orders in the Church of England are required to subscribe to them though the form of assent is recently been modified.

Art Nouveau, a term applied to the new art which spread across Europe and the U.S.A. during the 1890's. It was mainly a style of architecture and interior decoration which attempted to break with the old tradition of darkness and heaviness by the use of the new materials of cement, steel and glass from which it created patterns characterised by (a) over-elaboration (b) relatively naturalistic but tortuous representations of plants etc. (c) a ubiquity which left no surface undecorated. Typical of the extravaganzas of Art Nouveau are the cast iron lilies with copper tendrils in the cupboard doors and chair backs with heart-shaped holes and the furniture shaped like animals examples of which are still with us. In Britain the movement was basically a continuation of the Arts and Crafts movement of William Morris. Aubrey Beardsley represented the essentially fin-de-siècle school in his drawing.

Arts and Crafts Movement The English revival of decorative art which began about 1875 as a revolt against the existing vulgarity of internal decoration and furnishings and the pettiness of academic art. Inspired by William Morris and Burne Jones together with Possett, it was strongly influenced by the former's medievalism, his hatred of industrialism and his own version of socialism which included the regeneration of man by handicrafts. His firm of Morris & Co. produced wallpapers, tapestries, furniture, stained glass windows, carpets and fabrics in a style totally different from that of contemporary Victorian decoration. Morris's Kelmscott Press did much to raise the standards of book design and printing. See Art Nouveau.

Arum, a genus of plants of the Araceae family of which there is but one British species the wake-robin or cuckoo-pint, sometimes also styled Lords and Ladies. Its pointed leaves and spikes of scarlet poisonous berries are familiar in the hedgerows.

Arundel Marbles, a collection of ancient Greek sculptures formed by Thomas Howard, Earl of Arundel, in the 17th cent. and presented to Oxford University by his grandson Henry Howard who became Duke of Norfolk.

Aryans nomadic peoples who made their way in successive waves from the Eurasian steppes to the Indus and the Nile during the first half of the 2nd millennium B.C. They crossed the Hindu Kush into N.W. India and settled in the valleys of the Indus and Ganges where an earlier Indus civilisation had flourished, c. 3250-2750 B.C. Their religious ideas are reflected in the Vedas (oldest Hindu scriptures written down many centuries later in Vedic parent language of Sanskrit). Those who made their way to Syria and Egypt founded the Hyksos empire (c. 1680-1580 B.C.). The Aryans introduced the horse drawn chariot and spoke a language from which the great Indo-European family of languages is derived with one group in India and Iran and another in Europe.

Asafoetida, an acrid strong-smelling gum resin exuded from the stem of an umbelliferous plant *Ferula foetida*, found in Persia and Afghanistan. Formerly used medicinally to treat hysteria, still used in cooking in India, Iran, and France. Ascension Day or Holy Thursday is the 40th day after Easter.

Ascot Races are an annual fashionable function dating from 1711 and taking place on Ascot Heath only six miles from Windsor in June. These races have always had royal patronage. The course is nearly two miles long.

Ash a familiar deciduous tree of the genus *Fraxinus* of over 60 species native to North-temperate regions. The ash held an important place in Norse mythology as it was supposed to support the heavens with its roots in Hell. The species native to Britain and to Europe,

is *F. excelsior* a tall tree with compound leaves, greenish flowers, winged seeds and black bud in winter. It is a valuable timber tree tough and elastic and largely used for wheels and handles. The rowan or mountain ash *Sorbus aucuparia* with similar leaves and orange berries belongs to a different family. *F. yendula* or weeping ash is a weeping strain which makes an ideal natural summer house.

Ashes The symbol which distinguished the winning cricket team in the Australian Test Matches. In 1882 the Australians won at the Oval by 7 runs. After the match the following epitaph appeared in the *Sporting Times*: 'In affectionate remembrance of F. G. L. (cricket) which died at the Oval on Aug. 24 1882. Deeply lamented by a large circle of sporting friends and acquaintance. I.V.P. A.B.' The body will be cremated and the ashes taken to Australia. When the English flew a white flag to Australia the same winter it was said that they had come to recover the ashes. In fact, only two out of three matches and after the third match the ashes of what is now generally believed to have been a stump were preserved in an urn to fly. A later Lord Derby, however, bequeathed the urn to the M.C.C. and it now stands in the Melbourne Gallery. I.V.P.

4th Wednesday First day of Lent. The seventh day of Lent is before Easter.

Assassination treacherous murder for political ends, usually of ruler or diplomat in bad repute. Among the most notable instances are: 418 B.C. Phocas Becket 1170. Maxwell 1820. 1846 William the Silent 1584. Henry IV. of France 1610. Jean Paul Marat 1793. Archduke Franz Ferdinand 1914. Dr. Dollfus 1884. King Alexander of Yugoslavia 1934. Mahatma Gandhi 1948. King Abdullah of Jordan 1951. T. E. Lawrence 1951. King Faisal of Iraq 1958. Mr. Bandura 1958. President Kennedy 1963. Malcolm X 1965. Dr. Verward 1966. Dr. Martin Luther King 1968. Senator Robert Kennedy 1968. Mr. Tom Mboya 1969.

Asteroids are minor planets most of whose orbits lie between those of Mars and Jupiter. They were unknown until the discovery of Ceres by Piazzi in 1801. More than a thousand have been named and many thousands are believed to exist. After 1891 they were identified by their paths on exposed photographic plates. Most of them have a diameter of well under 50 miles. Ceres with a diameter of c. 480 m. is the largest, then there are Pallas (504 m.), Juno (230 m.), Vesta (240 m.), Astraea, Adonis, Hermes, Hidalgo, Eros, Amor, Apollo and the Trojan group which all take their names from Homer's *Iliad*—Achilles, Patroclus, Hector, Nestor, Priam, Agamemnon, Ulysses, Aeneas, Anchises, Troilus, Ajax and Diomedes. The asteroid Icarus (diameter c. 1 mile) makes the closest approach to the Sun and was within a few miles of the Earth on June 14 1988. A full list of asteroids has been issued by the Spanish astronomical historian Prof. A. Palisde-Borell.

Astrolabe, a medieval scientific instrument for taking altitudes, observing the sun by day and the stars by night and used for telling the time and finding the latitude. Used by the ancient Greeks later by the Arabs and Persians and introduced into Europe by way of Spain in the 14th cent. Chaucer is said to have sent his son Lewis a ten year-old student at Oxford an astrolabe with a treatise on its use in 1391.

Astronomical unit, the mean distance from the centre of the earth to the centre of the sun or half the major axis of the earth's elliptical orbit. It has been known for some 300 years that the earth-sun distance is roughly 93 million miles, but over the past 60-odd years astronomers have attempted to determine it with ever-greater accuracy using various methods of computation. Spencer Jones (1931) deduced a value of 93 004 000 miles. The American astronomer E. K. Rabe (1950) obtained a value of 92 914 800 miles and data from the Pioneer V space probe gave a value of 92 925 100 miles. There are two basic ways of determining the unit: one is based on observations of the minor planets, the other is the radar method based on the time taken for a radio signal bounced off the

planet Venus to return to earth. The earth-sun distance is a fundamental value in astronomy.

Astrology *See* 35

Astronomy The Pythagoreans believed the stars and planets moved with uniform circular velocity in crystalline spheres centred round the earth (the harmony of the spheres). Hipparchus (190-120 B.C.) made the first star catalogue, discovered the precession of the equinoxes and introduced the idea of epicyclic motion. His planetary system in the form it was presented by Ptolemy 200 years later held until the Renaissance when Copernicus revived the heretical view first put forward by Aristarchus of Samos (310-230 B.C.) that the sun and not the earth was at the centre. Galileo, accurate observer and experimenter went beyond Copernicus, helped by the contributions of Tycho Brahe, Giordano Bruno, Kepler and others, he was able to overthrow the Ptolemaic system of the heavenly spheres and Aristotelian philosophy and pave the way for Newton and modern astronomy. To Galileo we owe the conception of acceleration. To Newton the theory of universal gravitation. They showed that the same laws govern both celestial and terrestrial physics. Three landmarks in more recent times were the discovery of Uranus by Herschel in 1781 which extended the solar system as then recognised; the estimation by Hubble in 1924 of the distance of Andromeda which showed that our Galaxy was just one of many; and Einstein's theory of relativity which improved on Newton's theory of the solar system by bringing gravitation into the domain of space-time. Today radio telescopes and space probes are advancing astronomical knowledge and making it possible to explore regions beyond the scope of optical telescopes. The following have held the position of Astronomer Royal (period of office in brackets): John Flamsteed (1676-1719), Edmund Halley (1719-42), James Bradley (1742-62), Nathaniel Bliss (1762-65), Nevil Maskelyne (1765-1811), John Pond (1811-35), Sir George Airy (1835-81), Sir William Christie (1881-1910), Sir Frank Dyson (1910-38), Sir Harold Spencer Jones (1933-55), Sir Richard Woolley (1956-). *See* F8-7

Astrophysics, a branch of astronomy concerned with the physical nature and constitution of celestial bodies. Developments in space research technology have contributed to the great advance in this branch of science.

Athanasian Creed, one of the three ancient creeds of the Christian Church, often referred to as the *Quicumque Vult* is a statement of the doctrine of the Trinity and the Incarnation, and though named after St. Athanasius the view is now widely held that it is the work of St. Ambrose (339-97).

Atchody also called Ramjet or Propulsive Duct. This can be considered as an extremely simple gas turbine engine without any rotating parts. A power plant with great possibilities for high-speed aerial flight. It consists of a diffuser combustion chamber and exhaust chamber. Its thrust results from the fact that the gases leaving the atchody have a higher velocity than the gases entering it.

Atmosphere is the gaseous envelope of the earth and consists of a mixture of gases (*see* Air) and water vapour, the variability of the latter being of great importance meteorologically. The ozone layer which absorbs ultra-violet radiation which would be lethal to plant life if it reached the ground is concentrated at about 20 miles above the earth but extends to about twice that height. The lower level of the atmosphere up to a height of about 7 miles (6 miles at the Poles and 10 miles at the Equator) is known as the *troposphere* and it is in this region that nearly all weather phenomena occur. This is the region of most interest to the forecaster studying temperature, humidity, wind speeds, and the movement of air masses. Temperature falls with height by about 1° C per 500 ft. in this layer. The *tropopause* is the boundary between the troposphere and the *stratosphere*. Temperature varies little in the lower levels of this region. It is mainly cloudless, and has no vertical currents. Strangely enough, the lowest temperatures of the atmosphere

are to be found not at the Poles but at about 11 miles above the Equator where a temperature as low as -80° C has been recorded. Temperatures begin to rise about 20 miles from the earth's surface at about the same rate as they fall in the troposphere owing to the absorption of solar radiation by the concentration of ozone. The *stratosphere* is extremely dry. Near the 60 mile level a number of important atmospheric phenomena occur. Above this level the oxygen becomes predominantly monatomic in contrast to the normal diatomic form at lower altitudes. This is the *ionosphere* extending to heights over 500 miles from the earth's surface. This layer acts as an electrical radio mirror which makes long distance radio transmission possible. The auroras are most frequently observed at altitudes near 60 miles but do extend at times far higher. *See also* Ionosphere.

Atmospherics are electrical impulses which are believed to originate in atmospheric electrical discharge such as lightning. They give rise to crashing background noises in the loudspeakers of radio sets interfering with reception at distances of up to 4,000 miles from the centre of the disturbance. The location of atmospherics with the aid of radio direction finding methods gives warning of the approach of thunderstorms.

Atom *See* F9-14 F20

Atomic Pile an apparatus containing a fissionable element and a moderator such as heavy water or graphite in which a self-sustaining fission process proceeds at a controllable rate. The first atomic pile constructed on a squash court at Chicago was operated for the first time on December 2, 1942 under the direction of Dr. Enrico Fermi. The pile contained 12,400 lb of uranium. *See* Nuclear Reactors.

Augustan Confession, name given to the doctrine of faith of the Lutheran churches drawn up by Melancthon and endorsed by Luther for the Diet of Augsburg (1530).

August named after the Emperor Augustus because it was his lucky month.

Auk, duck-like sea birds black and white with short narrow wings, compact bodies and legs set well back. Breed in colonies on rocky coasts of N. Europe (incl. British Isles) and spend most time in coastal waters. Migrate south in winter. The Auk family includes the Razorbill, Little Auk, Guillemot and Puffin. The Great Auk became extinct in the 19th century after ruthless hunting for the sake of its feathers. Except for the Black Guillemot they lay only one egg a year.

Avic Council a supreme court of the Holy Roman Empire established by Maximilian I in 1501.

Aurora polaris. This wonderful phenomenon of the night sky is a common sight in some high latitudes north and south. It is visible less often in temperate latitudes and only very seldom in the tropics. As seen in the northern hemisphere it is called the aurora borealis or northern lights and in the south the aurora australis or southern lights. The zone of maximum frequency surrounds the north magnetic pole and includes Greenland, northern Canada and the north coast of Alaska. Auroral displays may take several forms, e.g. a faint glow, a diffuse ribbon of light crossing the heavens, great folded waving curtains like draperies, the whole sky may be a grand canopy of light. Both the aurora and the magnetic storm associated with it are ascribed to the envelopment of the earth in a great cloud or stream of solar gas shot out from stormy areas on the sun (sunspots) that has travelled to the earth at a speed of over a thousand miles a second. The gas is mainly atomic hydrogen but the atoms are broken up into their two parts, protons and electrons. These are both electrically charged. This renders them subject to the influence of the earth's magnetic field, which deflects many of them to the high latitudes where the aurora is most commonly seen. The aurora is a kind of light essentially different from that of the rainbow which is a partly subjective phenomenon. Each beholder sees his own rainbow whose light is sunlight refracted and reflected by many raindrops. The raindrops that produce his rainbow depend on his position as well as on the direction of the sun. The aurora on the contrary is a

light as objective as that of a candle though produced differently. It is a self-luminescence of the air in particular regions of the atmosphere that lie far above the clouds. By simultaneous observation from stations twenty or more miles apart it is possible to locate the position of the luminous air *viz.* to determine the height of the aurora its location in plan and its form and volume.

Austerlitz, Battle of. was fought near Bráun in Moravia on December 2 1805 when Napoleon defeated the Russians and Austrians under Kutuzov.

Auto-da Fé or Act of Faith was the ceremony connected with the sentencing of heretics under the Inquisition of Spain and Portugal the persons found guilty being imprisoned or burned alive. The ceremony took place in some public square sometimes in the presence of the king and court.

Automation is a recently coined word used to designate the adoption of methods of automatic control either of manufacturing processes or of any business process involving a large mass of routine work. The word is used in broader and narrower senses. In its broadest sense it covers any form of mechanisation which largely replaces human labour by the work of automatic or semi-automatic machines such as has been in progress continuously since the Industrial Revolution but it is better kept to a narrower meaning in which it is confined to the recent development of electronic or similar devices involving feedback (automatic detection and correction of malfunction). Human labour is eliminated save for that needed for watching and maintaining the elaborate machines used. In this sense automation has been spreading rapidly in advanced countries. See G12(1).

Autumn, the third season of the year begins with the autumnal equinox and ends with the winter solstice but the term is generally understood as covering the period from mid-August to mid-November.

Auxins, plant hormones organic substances produced by plants to regulate growth. Synthetic auxins are now widely used *e.g.* for promotion of root formation in cuttings differential weed control prevention of premature dropping of fruit in storage of potatoes and hard fruit and to overcome frost damage to fruit buds.

Average is a single number designed to give a typical example of a set of numbers *e.g.* a cricketer's batting average for a season gives an idea of his typical score. There are several kinds of average and their uses are studied in the science of statistics (*viz.*). A statement that so and so is the average value can be misleading if one does not know which average is meant. Three common averages are the arithmetic average (or mean) the mode and the median. The arithmetic average of *n* numbers is found by adding them together and dividing by *n*; this is a very common method of averaging. The mode of *n* numbers is the most frequently occurring number. The median is the middle number *viz.* the number which is smaller than just as many of the other numbers as it exceeds. Of the numbers 1 2 2 2 3 4 5 6 8 9 the arithmetic mean is 4 the mode is 2 the median is 3.

Avocet a graceful wading bird related to the stilts, of black and white plumage bluish legs, and slender upturned bill. There are four species. Avocets nest in colonies and there is one in the sanctuary on Havergate Island Suffolk.

Avogadro's Hypothesis. This is a fundamental concept of chemistry. Equal volumes of all gases under the same conditions of temperature and pressure contain the same number of molecules. This law was instrumental in assigning the formulae of molecules. The hypothesis was put forward in 1811 but was not generally accepted until 1860. See F31(3).

Aztecs the name of a native and powerful race found in Mexico when the Spaniards first discovered that country and with difficulty subdued.

B

Babroussa, a ferocious long-legged wild pig native of the Celebes, sometimes called the

horned hog because of the long upper tusks in the male which are developments of the canine teeth which grow upwards piercing the upper lip and curving backwards often broken in fighting.

Baboon monkeys belonging to the African genus *Papio*. They are considered the lowest of the Old World (Cathartine) monkeys and walk on all fours. In the main terrestrial but take to trees after food. The mandrill is closely related. **Babylonian Captivity** the period spent by the Jews in Babylon after Jerusalem was captured by Nebuchadnezzar the Babylonian emperor in 586 B.C. Traditionally the captivity lasted 70 years but when Babylon was in turn taken by Cyrus in 539 B.C. the exiles were permitted to return to Jerusalem. The term is also applied in church history to the period 1800-78 when the papacy moved to Avignon into the control of the French monarchy.

Badger a carnivorous mammal related to the weasel of nocturnal and burrowing habits in offensive subterfuge chiefly on roots and insects though sometimes mice young rats etc. and eggs form part of its diet. Badger baiting was a favourite sport in Britain until it was prohibited in the middle of 19th cent. The badger does little harm and is of good service against foxes but is to be condemned as a pest.

Bagpipe Once popular all over Europe the instrument is still played in Scotland Ireland Brittany and elsewhere. The bag acts as a reservoir of air and when squeezed by the player's arm forces air through the pipe. One of these the Chanter pipe provides the tune and is played by the fingers as in a flageolet. The remainder the Drone pipes give a continuous unvarying note.

Bailey Bridge, invented by Sir Donald Bailey and first used in N. African campaign 1942-3. Built up of pre-fabricated girders it can be easily transported and erected.

Bailie, a Scottish term for the magistrate of a municipal corporation or royal burgh.

Bailiwick, a feudal term denoting the limits of a bailiff's jurisdiction. The term has survived in the Channel Islands where Jersey and Guernsey are Bailiwicks.

Bakelite. A plastic material made from phenol formaldehyde and urea. It is used in the manufacture of electrical fittings because of its insulating properties.

Balance of Power was the doctrine in British policy whereby European groups should be so balanced as to prevent the emergence of a dominating Power. Thus the balance was maintained between the Triple Alliance (Germany Austria and Italy) and the Triple Entente (Great Britain, France and Russia) and preserved peace from 1871 to 1914. After the first world war there was tentative support of Germany's recovery to counterweight a possible French hegemony but when Germany's power grew under Hitler culminating in the second world war Britain France and Russia again became allies. By the end of the war the old system of a balance of power centred upon Europe collapsed to give way to a thermonuclear balance of power between the super-powers the Soviet Union (Warsaw Pact) and the United States (Nato alliance).

Baldachin (lit. *Baldachine*) a canopy usually supported by four pillars over throne altar or other sacred object. The name is also applied to the silken canopy used in processions and borne by the priest who carries the Host.

Balearic Crane, the crowned crane of the Balearic Islands and the North African mainland, distinguished by its yellowish black tipped occipital tuft and by its trumpet note.

Baleen or "whalebone" the name given to a series of horny plates growing from the roof of the mouth in those whales classified as Whalebone or Baleen Whales (*Mystacoceti*). There are 300-400 or so plates on each side, and their inner edges are frayed, the whole system constituting a filter for collecting minute organisms used for food. The Baleen Whales include the Right-Whales the Pacific Grey Whale and the Borewhales. See Whales.

Ballet is a combination of four arts: dancing music painting and drama, each of which is ideally of equal importance. The movement of

the individual dancers and the orchestration of the whole group in the hands of the choreographer. The dancer's training follows certain basic rules but save in classical ballet there is considerable freedom of movement. Ballet as we know it today developed professionally at the Court of King Louis XIV of France though it owes its origins to Italy and in the earliest times to Greece and Rome. Its movements were made up from the dances of courtiers, country folk and tumblers. Technique grew more complex as costume became modified, the body gaining complete freedom with the invention of tights. A succession of great dancers—French, Italian and later Russian left their imprint on the art. Contemporary ballet reflects the aesthetic of the Russian Sergei Diaghilev. In England Dame Ninette de Valois has laid the foundation of a national ballet at Sadler's Wells and Covent Garden, with a personality that reflects the national character. A Royal Charter was granted in 1957 setting up the Royal Ballet to co-ordinate the activities of the Sadler's Wells group.

Ballistics, the science dealing with the motion of projectiles especially shells, bombs and rockets. Great advances have been made in this science in recent years.

Balloon, the modern balloon consists of a bag of plastic material inflated with a gas lighter than air. The first ascent by man in a hot-air balloon was made on Nov. 27, 1783 and in a hydrogen balloon on Dec. 1, 1783. The most famous of the early scientific flights by manned balloons were those of the Englishmen Coxwell and Galsworthy in 1862 when a height of 7 miles was reached. The first aerial crossing of the English Channel by Blanchard and Jeffries was made on 7 Jan. 1785. Piccard's ascent to 10 miles in 1931 marked the conquest of the stratosphere. Four years later the huge American balloon Explorer II, inflated with nearly 4 million cubic feet of helium, carried a team of scientists with their floating laboratory to an altitude of 14 miles. In 1957 a pressurized balloon carrying an American doctor rose 10 miles above the Earth. Captive kite balloons were widely used in the war as defensive measures against air attack. Meteorologists send their instruments up in balloons to collect data about the upper atmosphere and of recent years physicists have learned much about cosmic radiation from the study of photographic plates sent to the upper regions in balloons. The American balloon satellites *Echo I* and *II* move round the Earth in orbits several hundred miles high and as the brightest of the earth satellites can be seen with the naked eye as brilliant points moving across the sky. Ballooning as a hobby is carried on by a number of enthusiasts.

Balsam, a big genus (140 species) of flowering plants. Many species are cultivated for their showy flowers e.g. *Impatiens noli me tangere*, the yellow balsam or touch-me-not so called because the fruit explodes when touched, slinging out the seeds. Balsam fir is a conifer (*Abies balsamea*) from which Canada balsam gum is obtained.

Baltimore Bird, a lively black and orange bird of the oriole sub family extending from Brazil to Canada. builds a well-constructed hanging nest and has a fine voice.

Bamboo, a genus of strong grasses, some species growing to over 120 ft. in height, much used by oriental peoples for all kinds of purposes. The young shoots of some species are tender and esculent. See T5 (2).

Banana (family *Musaceae*) a large herbaceous plant cultivated in moist regions of the tropics and one of the most productive plants known. The main areas of commercial cultivation are in tropical America, the Canary Islands and West Africa. World production is estimated at 20 million tons of which only 3 million are for trade.

Bandicoots, Australasian marsupial mammals, of the size of a large rat or rabbit. They are burrowing animals living largely on insects. The rabbit-eared bandicoot, restricted to Australia, has shrew-like snout, long ears like a rabbit, long crested tail, and a silky coat. The long-nosed bandicoot has a spiny coat and comes from E. Australia. The pig-footed bandicoot has two functional toes on the foot, like a pig.

Bantu (native word = people) term loosely used for large family of Negro races of Southern Africa.

Baobab, a tropical African tree. The species *Adansonia digitata* is one of the largest trees known, though not the tallest, the trunk can reach 80 ft. in thickness. The fruit is woody but its juice provides a cooling beverage. The bark yields a fibre used for making rope and cloth.

Barbary Ape, a large monkey belonging to the genus *Macaca*. It is the only monkey living in relative freedom in Europe, a small colony being found on the Rock of Gibraltar. It has no tail.

Barberry, a genus of berry-producing shrubs containing a hundred species. Several species are cultivated for their flowers and bright berries. Has an interesting pollination mechanism. The base of each stamen is sensitive to touch and insects probing for nectar cause top of stamen to spring inwards so dusting visitor's head with pollen which can then be carried to the next flower visited. The common barberry (*Berberis communis*) harbours one stage of the fungus that causes rust of wheat.

Barbican, a fortified entrance to a castle or city with projecting towers. In the London street called Barbican there was formerly a barbican in front of the city gates.

Barbiturates, a group of drugs derived from a parent compound called barbituric acid. phenobarbitone is the best known example. They induce sleep and are used in the manufacture of sleeping pills and sometimes as anaesthetics but they have the disadvantage of being habit forming. See also P23 (2).

Barbizon School, a school of mid 19th cent. landscape painters whose main tenet was a return to nature with an exact rendering of peasant life and country scenery painted on the spot. It was named after the village of that name in the Forest of Fontainebleau where its chief members—Jules Millet, Theodore Rousseau, Daubigny and Diaz—made their homes. Their practice of painting direct from nature which was far from universal at that time made them the precursors of Impressionism (q.v.).

Barcarolle, a Venetian gondolier's song applied to instrumental as well as vocal compositions.

Bard, among the ancient Celts a poet or minstrel whose mission was to sing of heroic deeds. He was supposed to have the gift of prophecy and was exempt from taxes and military service.

Barilla, soda carbonate or soda ash obtained by burning certain salt marsh plants (e.g. the saltwort *Salsola kali*). It is used to be in great demand until the product of the Leblanc and then the Solvay ammonia soda process was made available by the chemical industry.

Barium, metal element symbol Ba. In group II of the periodic table. The metal is soft and easily cut. It occurs as the sulphate and carbonate in nature. It was first prepared by Sir Humphry Davy in 1808 as an amalgam by electrolysis of barium chloride. The pure metal was not isolated until 1901.

Barium meal, Barium sulphate is opaque to X-ray and before taking X-ray pictures of the alimentary canal radiologists give a barium meal to the patients so that the alimentary canal shows up more clearly.

Barnacles constitute a sub-class (*Cirripedia*) of the Crustacea. The barnacle fouling the bottom of ships is the Goose Barnacle which has a long muscular stalk and a shell composed of five plates. The Acorn Barnacles which cover rocks, breakwaters etc. just below high water mark are similarly constructed, but have no stalk. The manner of feeding of barnacles was vividly described by T. H. Huxley who said the barnacle is a crustacean fired by its head kicking the food into its mouth with its legs.

It was a naval surgeon J. Vaughan Thompson who discovered in 1880 that barnacles have a free swimming larva (or nauplius). In the Middle Ages a curious myth grew up to the effect that the Barnacle changed into a sea bird called for that reason, the Barnacle Goose.

Barometer, is an instrument for measuring atmospheric pressure, invented at Florence by Torricelli, pupil of Galileo in 1644. The standard method consists of balancing the air column against a column of mercury used on account of its high density. The mercury is

contained in a long glass tube closed at one end and inverted in a cistern also containing mercury. The height of the mercury column supporting the air column is taken as the pressure at the time and can be read off very accurately by means of a vernier scale. 'Freezer' tendency is to express the readings in units of pressure instead of length the millibar being adopted (1 mb = 1000 dynes per sq cm 1000 mb = 29.53 inches of mercury approx). The standard instrument is correct for pressures at 0°C in Lat 45 so that corrections have to be applied for temperatures and latitudes other than these. Also a correction has to be made for reducing the pressure to mean sea level. See Aneroid.

Baron title given in feudal England to a man who held his land directly from the king by military or other honourable service. The first baron created by letters patent was John Beauchamp de Holt. Baron of Kidderminster in 1387. A baron is a member of the fifth and last grade of the peerage of the United Kingdom and is addressed as Lord. Life peers and life peeresses ran with hereditary barons and baronesses according to the date of their creation. In Scotland the term baron is used by the possessor of a feudal fief, the representative by descent of such a fief. The equivalent of the English baron is the rank of the Scottish peerage is Lord of Parliament.

Baronet the lowest hereditary title instituted by James I. to provide funds for the colonization of Ulster. The first baronet was Sir Nicholas Bacon. Since 1964 no recommendation for hereditary honours have been made.

Baroque a term used for the art style of the period c 1600-1720 which was the artistic accompaniment of the Jesuit counter Reformation. Its most obvious characteristics are (a) its emotional appeal and dramatic intensity both related to its deliberate intention as propaganda (a good picture makes better religious propaganda than a sermon said one of its exponents) (b) in architecture a style which is heavily and sometimes almost grotesquely or tastelessly covered with voluptuous sculpture on which draperies float rather than hang with twisted and spiral instead of plain or fluted columns and unnecessary windows or recesses added for ornament rather than use (c) its emphasis on the whole at the expense of the parts such that a building's sculpture merges into its architecture and both into its painting (Baroque paintings are as closely knit as a jigsaw puzzle so that one cannot isolate individual figures as would be possible in a Renaissance one). Baroque architecture owing to its origin is found mainly in the Catholic countries Italy France Austria Bavaria e.g. the Barberini Palace Rome designed by its greatest exponent Bernini and others the Church of the Invalides Paris. Baroque artists include Caravaggio Guido Reni Murillo and Rubens the greatest Northern Baroque painter. The Baroque style merges gradually into Rococo (q.v.).

Barque, a small sailing vessel with three or four masts. A three-masted barque has fore- and mainmasts square-rigged the mizzenmast fore-and-aft-rigged.

Barrow is an ancient artificial mound of earth or stone raised over the site of a burial. In Britain barrows were built from 2500 B.C. until the late Saxon period but the Egyptian are the earliest barrows known, the great pyramids being a spectacular development of the custom of ceremonial burial. Silbury Hill, south of Avebury is the biggest artificial mound in Europe, 1680 ft in circuit at the base 315 ft at top and 135 ft high.

Bartholomew, Massacre of St. occurred in Paris on the night of Aug 24 1572 when over two thousand Huguenots were massacred by order of the Catholic French Court.

Basalt Rocks are fine-grained, dark coloured of igneous origin and occur either as lava flows as in Mull and Staffa, or as intrusive sheets like the Edinburgh Castle Rock and Salisbury Craig. One of the most noted examples of columnar basalt is that of the Giant's Causeway in Ireland.

Basanite, A smooth black siliceous mineral, or flinty jasper - a crypto-crystalline quartz

used as a touchstone for testing the purity of gold etc by means of the mark left after rubbing the metal with it. Sometimes styled the Lydian stone.

Base a substance having a tendency to accept a proton (H⁺). This is a wide definition and covers unconventional types of compounds. In aqueous solution bases dissolve with formation of hydroxyl ions and will neutralise an acid to form a salt. In non aqueous solvents like liquid ammonia or hydrogen fluoride compounds classically regarded as salts can be bases e.g. sodium fluoride is a base in hydrogen fluoride solution. See P22.

Basilisk a lizard of aquatic habit with an elevated crest which it can erect or depress at will down the centre of its back.

Basques, people of N Spain and S.W. France, oldest surviving racial group in Europe who have preserved their ancient language which is unrelated to any other tongue.

Bas Relief 'low relief' a term used in sculpture to denote a class of sculptures the figures of which are only slightly raised from the surface of the stone or clay upon which the design is wrought.

Bastille a castle or fortress in Paris built in the 14th cent. and used as a state prison especially for political offenders. It had repute as an instrument of despotism excited the hatred of the populace who stormed and demolished it on July 14 1789 at the beginning of the Revolution.

Bastinado an oriental punishment by which with a pliable cane on the soles of the feet.

Bats These mammal fly by means of a membrane stretched between each of the long fingers of the hand and between the fifth finger and the body. Another membrane stretches between the leg and the tail. There are twelve British species namely the Noctule Lesser B. Serotine Pipistrelle Long eared B. Daubenton's B. Natterer's B. Whiskered B. Bechstein B. Barbastelle Greater Horseshoe and Lesser Horseshoe Bats. Bats avoid obstacles and locate their prey by emitting pulses of very high frequency sound inaudible to the human ear (unless a bat detector is used). Blindness does not affect this ability but deafness leaves them comparatively helpless. Bats are mostly insectivorous, catching the insects in their open mouths while flying some eat fruit. During the winter they survive on their stored fat. The Vampire Bats feeding exclusively on blood are confined to tropical America. See Ultrasonics.

Bath, Order of the believed to have been established by Henry IV. at his coronation in 1595 remodelled in 1725 as a military order formally instituted in three classes in 1815 civil division added in 1847. In the Order are three classes G.C.B. or Knight Grand Cross of the Bath K.C.B. or Knight Commander of the Bath C.B. or Companion of the Bath. Companionship of the Bath does not carry knighthood nor entitle the holder to the prefix 'Sir'. The motto of the order is *Tria juncta in uno* (Three joined in one). The insignia for civil and military and the three classes vary. See Knighthood.

Battery Electric the common term for an electric cell but really meaning a combination of two or more cells. A cell is a device for converting stored chemical energy into electricity which can then be used for heat, light traction or any desired purpose. A primary cell will do this until the chemical action is completed and the cell is then useless. In a secondary cell the chemical actions are reversible and the cell can be returned to its initial condition and used again. This is done by passing an electric current through a process called recharging. A common primary cell is the Leclanché dry cell used in torches. This works by the action of sal-ammoniac on electrodes made of zinc and carbon. About a century after it came into common use it is still the chief source of power for portable equipment in armed forces. A common secondary cell is the lead and sulphuric acid accumulator used in cars. Many other types of cell are known and some are under development because the demands of space travel medicine, warfare, etc call for batteries.

of lighter weight greater reliability or special properties. **Bee Fuel Cell Energy Conversion** Bauhaus a German institution for the training of architects artists and industrial designers founded in 1919 at Weimar by Walter Gropius (d 1969). It was closed by Hitler in 1933 and reopened at Chicago. The Bauhaus doctrine held that there should be no separation between architecture and the fine and applied arts that art science and technology should co-operate to create the compositely inseparable work of art the great building. Thus it was an organisation with a social purpose. The original institution at the instruction of Gropius included on its teaching staff not only architects and technicians but also such noted artists as Paul Klee and Wassily Kandinsky.

Bauxite the chief ore of aluminium. Chemically it is aluminium oxide. Aluminium metal is made industrially by electrolysis of purified bauxite dissolved in fused cryolite. Chief producing areas: Surinam Guyana U.S.A. France Hungary Indonesia U.S.S.R. Yugoslavia Italy.

Bayeux Tapestry a famous tapestry representing the conquest of England by William the Conqueror. It is embroidered on a band of linen 231 ft long and 20 in wide in blue green red and yellow divided into 72 scenes running over the whole story of the conquest. The accepted view is that the tapestry was commissioned for Bayeux Cathedral but a new interpretation is that it is an Anglo-Norman secular work of art much influenced by the contemporary *Chanson de geste* (songs of deeds) executed by English embroiderers for a Norman patron. A representation can be seen in the Victoria and Albert Museum in London.

Beagle a small hound that tracks by scent and formerly used for fox hunting.

Bears belong to the Ursidae family of the Carnivora. They are plantigrade mammals walking (like man) on the soles of their feet. Found in most parts of the world except Australia. The common Brown Bear was once spread over the whole of Europe, became extinct in England about the 11th cent. 7-8 ft in length and stands 3 ft or more at the shoulder. The Grizzly Bear of N America is larger and the coat is shorter and grayer. The Polar Bear is remarkable in having white coat all the year round. It spends much time in water and unlike the other bears it is entirely carnivorous. Bear baiting was made illegal in England in 1835.

Beaufort Scale of wind force is used to specify numerically the strength of the wind. Since the introduction of anemometers to measure the actual velocity equivalent values of the ranges in miles per hour at a standard height in the open have been assigned to the Beaufort numbers. See N10.

Beaver a genus of mammals of the Rodentia order with short scaly ears webbed hind feet and a long broad scaly tail. They grow up to 4 ft long and live in communities constructing dams and lodges where they breed. Found in N America Russia and Poland. Hunted mercilessly by trappers for its valuable pelt before protective laws were passed.

Bedford Level comprises parts of Norfolk Suffolk Huntingdon Northampton Lincoln, and Cambridgeshire generally called the Fens 70 miles long and 20 to 40 miles broad. It was reclaimed and drained in the 17th cent by the Earl of Bedford and the Dutch engineer Cornelius Vermuyden.

Bedlam (a corruption of Bethlehem) was a priory in Bishopsgate, afterwards converted into a hospital for lunatics. The asylum was transferred to St George's Fields, Lambeth in 1815. The term bedlamite came to be applied to any person behaving like a madman.

Beech, a deciduous tree belonging to the genus *Fagus* of some eight or nine species found in north temperate regions. The common beech *F. sylvatica* is believed to be native to Britain and is one of our finest trees, with massive trunk, long pointed winter buds, and smooth, grey bark. There is little undergrowth under its dense shade. It is shorter lived than the oak, taking about 200 years to reach full size and then declining. The timber of beech has a variety of uses, e.g. spoons handles, tools, and chairs.

Bee-eater name of a family of brilliantly coloured birds closely related to the rollers and kingfishers inhabiting the tropical and sub-tropical parts of Africa Asia and Europe. The European species successfully nested in Britain for the first time in 1955 and a pair nested in Alderney in 1956. With their long curved beaks they catch insects on the wing especially bees and butterflies and lay their eggs in dark nest tunnels.

Beeswax See Yeomen of the Guard.

Beeswax, the secretion of the bee used for the formation of the cells or honey comb of the hive when melted it is what is commercially known as yellow wax white wax being made by bleaching. Being impervious to water it acts as a good resistant and is an article of much utility.

Beetles (Coleoptera) constitute one of the biggest orders of insects numbering over 200 000 species. There are two pairs of wings the hind pair are used for flight while the front pair are hardened to form a pair of protective covers (elytra). Some beetles have lost the power of flight and then the elytra are joined together.

Bel and the Dragon is the title of certain supplementary chapters to the Book of Daniel of an apocryphal character. First appeared in the Septuagint but the Jewish Church did not accept it as inspired. In 1546 the Council of Trent declared it to be canonical.

Bell a hollow body of metal used for making sounds. Bells are usually made from bell metal an alloy of copper and tin. Small bells used for interior functions are often made of silver gold or brass. Ordinary hand bells are of brass. From the 7th cent. large bells have been used in England in cathedrals churches and monasteries. The greatest bell in the world is the King of Bells in the Kremlin at Moscow which weighs about 198 tons is 20 ft 7 in high and 22 ft 8 in in diameter. It was cast in 1733 but cracked in the furnace (the broken part weighed 11 tons) and is now preserved as a national treasure. Other large bells in Russia include the 171 ton one at Krasnogvardevsk near Leningrad and the one of 110 tons at Moscow. The Great Bell (Great Paul) at St Paul's cast in 1881 weighs 163 tons and is the largest in the United Kingdom. Other gigantic bells are the Great Bell at Peking (53 tons) Nanking (22 tons) Cologne Cathedral (25 tons) Big Ben Westminster (13+ tons) Great Peter York Minster (10 tons). The Curfew bell is rung in some parts of England to this day notably at Ripon. The number of changes that can be rung on a pair of bells is the factorial of the number of bells. Thus four bells allow 24 and eight bells 40 320.

Belladonna or Deadly Nightshade (*Atropa bella donna*) a well known poisonous wild plant found in Southern Europe and Western Asia. The alkaloid atropine it contains is valuable in medicine although a large dose is poisonous.

Bell Book and Candle To curse by bell book and candle was a form of excommunication in the Roman Church ending with the words 'Do to the book quench the candle ring the bell'.

Benedicite the canticle in the Book of Common Prayer known also as The Song of the Three Holy Children.

Benedictines are monks and nuns of the Benedictine Order who live under the rule of St Benedict—the monastic code whose influence on the religious and cultural life of the West has been so powerful. The rule is marked by an absence of extravagant asceticism. The greatest of the early Benedictines was Pope Gregory I (590-604) who sent St Augustine of Canterbury to Anglo-Saxon England. Gregorian plainsong is named after him. See also J34(1).

Benedictus a canticle used in the morning service of the English Church and deriving its name from the first word of the Latin verse *Benedictus* blessed.

Benzene An aromatic hydrocarbon obtained from coal tar and some petroleum fractions. It is a volatile inflammable liquid with a characteristic smell. The molecule consists of a flat ring of six carbon atoms each bound to one hydrogen atom. Benzene is the parent member of many aromatic organic compounds and is

widely used in industry to synthesise intermediate for fibres (nylons), explosives, and pharmaceutical chemicals.

Beryl A mineral of which the emerald is a grass-green variety. Composed of beryllium and aluminium silicates. The pure mineral is colourless; the colour of most beryl comes from traces of impurities, notably iron and chromium. Otherwise it is yellowish, greenish, yellow or blue and is found in veins within traverse granite or gneiss or embedded in granite and sometimes in alluvial or fluvial from such rocks.

Beryllium Metallic element symbol Be. Very similar to aluminium, it is stronger than steel and only one-quarter its weight. It is not very abundant; its main source is the mineral beryl. Copper containing 2% beryllium is used for making springs. Because of its special properties the metal is used as a component in spacecraft missiles and nuclear reactors. This accounts for its recent development on a technical scale. The metal powder is toxic.

Bessemer Process, for making steel depends on the forcing of atmospheric air into molten pig iron to burn out the impurities. *See* Steel.

Betel The leaf of an Indian climbing plant of pungent narcotic properties. It is not very toxic to the teeth and reddens the gums and lips.

Bhang The Indian name for the hemp plant *Cannabis sativa*; the leaves and seed capsule of which are chewed or smoked. The potent drug which comes from flowers of the female plant is called hashish in Arabia and marihuana in the United States and Mexico. *See* F23(2).

Bible (Greek *biblion* = scroll of paper, pl. *biblia* = writings) includes the Hebrew sacred Scriptures (Old Testament) and those held sacred by the Christians (New Testament). The Old Testament—the prehistoric portion—consists of 39 books and is divided into three parts: (1) the Law, (2) the Prophets, (3) Miscellaneous Writings. The Old Testament was written in Hebrew except for parts of Ezra and Daniel which were in Aramaic. It was not until the 9th cent. A.D. that a complete Hebrew text was made, the so-called Massoretic text. Before that the main versions were the Alexandrian Greek translation (Septuagint) made in the 2nd cent. B.C. and St. Jerome's Latin Vulgate of the 4th cent. A.D. (It was Jerome who used the Latin word *testament*, formed from *testis* = a witness). Portions were translated into the Anglo-Saxon in the 8th cent. and the Venerable Bede put the greater part of St. John's gospel into English, but it was not until 1535 that a complete printed English version appeared—the Coverdale Translation. The Authorised Version dates from 1611 in the reign of James I. and because of its beautiful phraseology it has had a lasting appeal. The Revised Version dates from 1885. *The New English Bible* with the Apocrypha was published in 1970. It is a new translation in plain English prose of the earliest Hebrew Aramaic and Greek manuscripts. The finding of the Dead Sea Scrolls (since 1947) has added to our knowledge of Scripture.

Billion, in English usage, a million million or 10^{12} ; in American and French usage a thousand million or 10^9 .

Bill of Rights, or Declaration of Rights, was the document setting forth the conditions upon which the British throne was offered to William and Mary in 1688. This was accepted and ultimately became an Act of Parliament.

Binary Notation, for numbers, is a way of representing numbers using only two digits: 0 and 1. Electronic digital computers handle numbers in this form and many people these days are having to learn it. Many school children find it both easy and fascinating—as did the great philosopher and mathematician Leibniz. The ordinary or decimal numbers, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 are written in binary notation as follows: 0, 1, 10, 11, 100, 101, 110, 111, 1000, 1001, 1010. The reader might divine the rules from this. The point is that you 'carry 1' i.e. move the digit 1 a place to the left when you reach 2. In decimal notation you move 1 a place left when you reach 10. In other words, instead of columns for units, tens, hundreds, thousands, etc., the columns are for units, two, Q. (80th Ed.)

four, eight, etc. In binary notation 1 = 1, 0 with 1 to carry. Since every digit in binary notation is either 0 or 1 it requires one bit of information to specify a binary digit. *See* Bit.

Biological Warfare is the use of warlike agents of bacteria, viruses, fungi or other pathogens. These can be used to spread disease, incapacity, disease or death among the enemy's people or livestock. One of the strange facts to which mankind puts its science is to make naturally infective organisms even more virulent for military use. This sort of research can be done in many countries. It is much cheaper and easier to hide than nuclear weapons development. Secret attack by biological agents is supposed to be easy and it may affect the populations without damaging buildings or bridges. However, the true effectiveness of biological warfare is largely unknown—meteorological conditions alone might render an attack completely unreliable.

Birch, a genus of deciduous trees including about 40 species and found only in northern regions. Birches native to Britain and to Europe generally are of two species—the silver birch *Betula pendula* with its graceful drooping branches and triangular leaves and the white birch *Betula pubescens* which has erect branches and soft oval leaves. Birch timber is an important plywood timber; the bark is used for tanning leather and wintergreen oil comes from the bark of black birch *Betula lenta*, a North American species. The birch is not a long-lived tree, few standing for more than a hundred years. The tallest recorded is at Woburn in Bedfordshire 102 ft. high.

Birds, or *aves* are next to mammals, the highest class of animal life. There are two kinds of modern birds—*carinate* possessing keeled breast bones and having power of flight. *Ratite* having raft-like breast bones, and in capable of flight and a sub-class of fossil birds. Archaeornithes including *Archaeopteryx*. It is estimated that there are about 120 million land birds breeding in Great Britain including 10 million each of the chaffinch and blackbird, 7 million each of the starling and robin and about 2 million sparrows.

The wheatear is usually the first of the migratory birds to return, often reaching Britain at the end of February and always before the middle of March. The sand martin is the first of the early swallows to return, followed by the house martin. The first cuckoo arrives about the middle of April, and the whitethroat, garden warbler and sedge warbler during the last week in April. The whitethroat spotted flycatcher and red backed shrike are not seen until the first week in May. The swift is among the last to return from Africa and the earliest to depart. Bird-nesting is illegal in Britain. *See* also F33, Z21.

Birds of Paradise, over 40 species of tropical birds inhabiting the dense forests of New Guinea and neighbouring islands. The male birds are remarkable for their brilliant plumage, long tail feathers, and ruffs on wings and neck, which are displayed to advantage during courtship. Related to the Bower Birds of Australia, and crows.

Biretta, a four-cornered head-covering worn by ecclesiastics of the Roman Church and varying in colour according to the rank of the wearer. A cardinal's biretta is red, a bishop's purple, a priest's black.

Bise, a keen dry north wind prevalent in Switzerland and South France.

Bishop is a Christian ecclesiastic a person consecrated for the spiritual government of an area, a diocese or province to the spiritual oversight of which he has been appointed (diocesan bishop) or to aid a bishop so appointed (suffragan bishop). In the Church of England there are forty-three diocesan bishops, all nominated by the Crown. Two, Canterbury and York, are archbishops having primacy in the respective provinces. The archbishops of Canterbury and York and the bishops of London, Durham, and Winchester and twenty-one other diocesan bishops in the order of seniority are spiritual peers, and sit in the House of Lords. The (Disestablished) Church of Ireland

- has two archbishops and twelve bishops the (Disestablished) Church of Wales an archbishop and five bishops and the Episcopal Church in Scotland seven bishops *See also* Cardinal
- Bismuth** metallic element symbol Bi in group V of the periodic table. Like antimony the stable form is a grey brittle layer structure electrical conductor. It is readily fusible melting at 264° C and boiling at about 1420° C. Wood's metal, an alloy with one of the lowest melting points (under 150° F) so that a spoon made of it will melt when placed in a cup of hot tea) contains four parts bismuth two parts lead one part tin one part cadmium
- Bison**, a genus of wild cattle distinguished from the ox by its shorter wider skull beard under the chin high forequarters and in winter a great mane of woolly hair covering head and forequarters. There are two species the European and the American bison both now protected in game preserves
- Bit** formerly the word often referred to the metal piece in the mouth of a bridled horse now more likely to be a technical expression in the mouth of a computer expert. A bit is a unit of information it is the information that can be conveyed by indicating which of two possibilities obtains. Any object that can be either of two states can therefore store one bit of information. In a technical device the two states could be the presence or the absence of a magnetic field or of an electric voltage. Since all numbers can be represented in the binary system (*see* Binary Notation) by a row of digits which are either 0 or 1 it takes one bit of information to specify a binary digit. Bit is short for binary digit
- Bittern**, a bird of the heron genus with long loose plumage on the front and sides of the neck. It is a solitary bird inhabiting marshes but rare in Britain
- Bivalves** shell fish whose shell consists of two hinged valves lying one on each side of the body such as mussels oysters and cockles
- Blackbird**, or *Merle* a member of the Thrush family a familiar song bird in Britain. Male is all black with orange bill female is mottled brown with brown bill the young are spotted brown
- Blackcock** and **Greyhen** (as the female is called) are closely related to the Capercaillies but smaller. They nest on the ground and prefer wooded country to open moors. Found in northern half of northern hemisphere. Poly gamous they perform excited courtship dances the male is a handsome blue black bird with white undertail the female dark brown mottled
- Black Death**, the plague which swept across Europe in the years 1348-50 beginning in the ports of Italy brought in by merchant ships from Black Sea ports. It was the worst scourge man has ever known at least a quarter of the European population was wiped out in the first epidemic of 1348. It reached England in the winter of that year. The disease was transmitted to man by fleas from black rats though this was not known at the time, the specific organism being *Bacillus pestis*. The disease continued to ravage Europe in recurrent outbreaks up to the late 17th cent. The epidemic which raged in England in 1665 wiped out whole villages and one tenth of London's population of 460 000. Samuel Pepys wrote a grim account of it in his *Diary*. *See also* Labourers, English Statute of.
- Black Hole of Calcutta**, the name given to the place where a captured British garrison was confined in 1756 during the struggle for India between the French and British. Into a noisome space, about 20 ft square, 146 persons were driven and only 23 were found alive the next morning. The authenticity of the story has been called into question, but after sifting the evidence Professor H. H. Dodwell in the *Cambridge History of the British Empire*, believes it to be substantially true
- Black-letter**, the Old English or Gothic type first used in printing blocks
- Black Woodpecker** (*Dryocopus martius*), a large, black bird about the size of a rook, with slightly crested scarlet crown, found in many parts of Europe
- Blenny**, a group of marine fishes with spiny rays part of the fin running along the back. Several species are found around the British coast.
- Blood Groups** *See* Index to Section P *also* F50
- Bloody Assizes** the assizes conducted in 1685 by George Jeffreys Lord Chief Justice at which participants in the Duke of Monmouth's rebellion against King James II were tried. They were marked by relentless cruelty
- Bluebird** a migratory bird of North America deriving its name from its deep blue plumage. It is one of the few song birds of America and familiar in the woods from early spring to November. In India and Malaya there is the Fairy Blue bird the male is black with shiny blue upper parts. The bluebird was used as the symbol of happiness by Masterlinck in his play *The Blue Bird*
- Blue Peter** a blue flag with a white square in the centre is hoisted 24 hours before a ship leaves harbour (the letter P in the alphabet of the International Code of Signals)
- Blue Ribbon** a term in general use to denote the highest honour or prize attainable in any field or competition. Thus the Derby is the blue ribbon of the turf. The expression is derived from the highest Order of Knighthood in the gift of the British Crown the insignia of which is a garter of blue velvet
- Blue Stocking** a term used to describe a learned or literary woman particularly if pedantic and undomesticated. It is said that the term derives from the Bas Bleu club of Paris which was attended by the literary savantes of the 17th cent. In England a similar literary club was formed about 1780 whose members were distinguished by their blue stockings
- Blue Sun, Moon** etc. a phenomenon caused by the scattering of sunlight by transparent particles suspended in the atmosphere the effect being that blue light is transmitted and red light extinguished to direct vision. The dust from the Krakatoa eruption in 1883 and the drifting layer of smoke from the forest fires in Alberta Canada in September 1950 gave rise to blue moons and suns phenomena sufficiently rare to be described as occurring once in a blue moon. In the cold climatic conditions of the Fannus and the far north vegetation is said to look blue on account of the rays of high caloric value (red, yellow green) being absorbed while only the blue and violet are transmitted. It was Tyndall who first explained the blue colour of the sky
- Boa**, a term applied to a family of snakes of large size some attaining a length of 80 ft. They are not poisonous but kill their prey by crushing—constriction—hence the name 'boa constrictor'. They occur both in the Old World and the New but are more abundant in the latter. Most Boas retain the eggs within the body until young are fully developed whereas the Pythons almost all lay leather shelled eggs
- Boar** or **Wild Hog** an animal largely distributed over the forest regions of Europe Asia Africa and South America. It has a longer snout and shorter ears than its descendant the domestic hog and is provided with tusks. Having to forage for itself it is a more active and intelligent animal than the pig of the sty and offers good sport to the hunter
- Boat**, an open vessel propelled by oars or sails or both. The boats of a ship of war are the launch, barge, pinnace yawl cutters jolly boat and gig of a merchant vessel the launch skiff jolly boat or yawl stern boat quarter boat and captain's gig. Every ship is compelled to carry adequate fully provisioned and equipped lifeboats
- Bode's Law**, a numerical relationship formulated by Bode in 1772 which states that the relative mean distances of the planets from the sun are found by adding 4 to each of the terms 0 3 6 12 24 48 96. The actual mean distances (in millions of miles) are Mercury 36 Venus 67.2 Earth, 92.9 Mars, 141.6 Jupiter 483.3 Saturn 886.0 Uranus 1782.8. The gap between Mars and Jupiter caused Bode to predict the existence of a planet there which was later confirmed by the discovery of Ceres and other minor planets. The law breaks down, however for Neptune and Pluto
- Boer War** lasted from Oct. 11, 1899 when the Boers invaded Natal to May 31, 1902 when the Treaty of Vereeniging ended hostilities. At first the operations of the British troops in

Cape Colony were unsuccessful and disastrous reverses were sustained. Lord Roberts was then sent out as Commander in Chief with Lord Kitchener as Chief of Staff and from February 1900 when Kimberley was relieved and Cronje was compelled to surrender and Ladysmith and Mafeking were relieved the struggle was practically over.

Bolling-point is the temperature at which a liquid boils. At that point the pressure of the vapour is equal to the pressure of the atmosphere. Under increased pressure the boiling point rises and under less pressure as on the top of a mountain it is lower. At standard atmospheric pressure (760 mm of mercury) the boiling point of water is 100°C, alcohol 78.4°C, ethyl 78.3°C.

Books Sizes of See Section N

Books, Classification of. All libraries are classified to facilitate reference but the favourite system is the Dewey Decimal System which divides the whole field of knowledge into ten Main Classes. General Works, Philosophy, Religion, Sociology, Philology, Natural Science, Useful Arts and Applied Science, Fine Arts, Literature, History (including Geography and travel and biography). Each of these Main Classes is again subdivided into ten main divisions. As an example the main class of Sociology receives the number 300. This range 300 to 400 (the next main class) is graduated into tens and Economics is 330. The range 330 to 340 is again graduated and the subject of Labour and Capital is 331. This process is carried on by decimals so that \$31.2 deal, with Remuneration for Work \$31.22 with Wage Scales and \$31.225 with Extra Pay.

Borax (Sodium Pyroborate) is a white soluble crystalline salt. It is widely and diversely used, e.g. as a mild antiseptic in glazing pottery in soldering in the making of pyrex glass, as a cleansing agent and sometimes as a food preservative. Borax occurs naturally in the salt lakes of Tibet where it is called tincal in California (Borax Lake Death Valley) and elsewhere.

Bore In physical geography an almost vertical wall of water which passes upstream along certain estuaries. Its formation requires special conditions of river flow incoming high tide and shape of river channel. It can be spectacular and dangerous on some rivers. In Britain the best known is the Severn bore which can be a few feet high and move at 10 or 12 m.p.h. In some parts of Britain the bore is called an ebb.

Boron A metalloid element symbol B. There are two forms, one crystalline the other amorphous. It is not very abundant in nature but occurs in concentrated deposits. It is best known in boric acid which is used as a mild antiseptic (called boracic acid) and borax ($\text{Na}_2\text{B}_4\text{O}_7$). Boron compounds are essential to some plant e.g. beans. Used in the preparation of various special purpose alloys, such as impact resistant steel. Compounds of boron and hydrogen are used as rocket fuels.

Borstal An institution where young offenders between 15 and 21 on conviction may be sent for detention and reform. Emphasis is placed on vocational training in skilled trades. The Children and Young Persons Act 1969 makes provision for the minimum age to be raised to 17 if and when the Home Secretary makes an order to that effect. The first was opened in 1902 at the village of Borstal, near Rochester in Kent.

Boston Tea Party An incident which occurred on Dec. 17, 1773 on board some tea ships in Boston Harbour. High taxation imposed by the British Parliament under George III. had caused bitter feelings, and instigated by popular meetings a party of citizens, disguised as Indians boarded the tea-ships and threw the tea overboard. This incident was a prelude to the American War of Independence (1775-83).

Bounds Beating an old Anglo-Saxon custom. The parish clergyman and officials go round the parish boundaries accompanied by boys who beat the boundary stones with long sticks of willow. The ceremony takes place on the Rogation days preceding Ascension Day.

Bourgeoisie, a term used by Marxists to indicate those who do not like the proletariat, live by the sale of their labour. They include, on the one hand, industrialists and financiers or mem-

bers of the liberal professions and on the other small artisans and shopkeepers who although their standard of living may not be appreciably higher (and today is often lower) than that of the proletariat are described as the petty bourgeoisie. According to the Marxist view of history the bourgeoisie arose with modern industrialism after it had overthrown the old feudal aristocracy and replaced it with a class Bow in instrument for propelling arrows and in the days when it was a weapon of war was usually made of wood or ash and was about 6 ft long with an arrow 3 ft long. It was the weapon with which Crécy, Poitiers and Agincourt were won. The cross bow was Italian and was adopted in France but did not become popular in Britain.

Bow Bells is the name of the London church of St. Mary le Bow. Cheapness within sound of which one must be born to be entitled to be called a cockney. Bow Bells had not been heard since 1930 but they once again rang out over the City of London on Dec. 10, 1961.

Bowlerize to expurgate a book. Derived from Thomas Bowdler 1754-1835 the editor of the Family Shakespeare in which those words and expressions are omitted which cannot with propriety be read aloud in a family. He treated Gibbons' *History of the Decline and Fall of the Roman Empire* in the same way omitting all passages of an immoral and immoral tendency. Such prudery met with ridicule and hence the word bowlerism or bowlerize etc.

Bower Bird native to Australia and New Guinea and related to the Bird of Paradise though it is less striking in appearance. In the mating season the male builds a bower of sticks and grasses for courtship displays and to play ground. The Gardener Bower Bird or Fairy makes a lawn in front of his bower and adorns it with bright coloured pebbles and flowers which are replaced as they wither. The female builds her nest away from the bower.

Boycott a term used in connection with a person that the general body of people, or a party or society refuse to have dealings with. Originally used when Captain Boycott (1832-97) was made the victim of a conspiracy by the Irish Land League which prevented him making any purchases or holding any social intercourse in his district. He had incurred the League's hostility by a number of evictions.

Brass, an exceedingly useful alloy of copper and zinc. Much brass is about two-thirds copper but different proportions give different properties. It is harder than copper and easily worked. Brass in the Bible (Matt. x, 9) probably refers to bronze.

Breadfruit Tree (*Artocarpus altilis*) a native of the South Sea Islands. The fruits are a brownish green about the size of a melon, and contain a white pulpy substance which is roasted before being eaten. The tree grows 40 ft. or more. Captain Bligh a ship *Bounty* was on a voyage to Jamaica carrying a cargo of 1,000 breadfruit trees when the mutiny occurred.

Breeder Reactor a kind of nuclear reactor (q.v.) which besides producing energy by the fission process also produces (breeds) more nuclear fuel at the same time. A typical reaction is a neutron induces fission of a ^{235}U nucleus which breaks up into two medium-sized nuclei and some neutrons. One of the latter then enters a ^{238}U nucleus turning it into ^{239}Pu which then decays radioactively via neptunium into plutonium which is useful fuel. There are technical problems in breeder reactors which have delayed their practical use but the "breeding" principle is so valuable that experiments have gone on for many years in, e.g. Scotland and Idaho, and breeder reactors will no doubt increase in importance the more the supply of natural nuclear fuel appears to become depleted.

Breviary (Lat. *breviarius* = abridgement), the short prayer book of the Roman Catholic Church which gives the Divine Office, i.e., the canonical hours or services. The directions for Mass are in the Missal. The modern Roman breviary is a reformed version of the 11th-cent. breviary and was produced by Pope Pius V. in 1568 in response to a decree of the Council of Trent. All Roman Catholic priests are required to

recite the whole of the breviary services allotted for each day. *See also* **Matins**.

Bridges are structures for continuing a road, railway or canal across a river, valley, ravine or a road or railway at a lower level. From early times bridges were made of timber, stone or brick and it was not until the 19th cent. that wrought and cast iron were used. Today the materials mostly used are steel and reinforced concrete. Among the most famous of ancient bridges is that of S. Angelo at Rome built by Hadrian as the Pons Aelius A.D. 134. The Rialto bridge at Venice dates from 1593. The Ponte Santa Trinita at Florence one of the finest Renaissance bridges and deemed the most beautiful in the world was destroyed by German mines in 1944 but has now been reconstructed just as it was before. The first stone bridge across the Thames was begun in 1176. It had 19 arches and was lined with houses and stood until 1831 when it was replaced by the granite bridge designed by Sir John Rennie. By 1972 this will have been replaced by a new three span concrete bridge with a six lane carriageway and two footways. The first cast-iron bridge was at Ironbridge, Madeley Shropshire built in 1779 and now in need of repair. Telford's Menai suspension bridge (1825) has since been enlarged but the original design has been maintained. Another example of Britain's supremacy in constructional iron work was Robert Stephenson's tubular bridge across the Menai Straits (1850) the prototype of all modern plate girder railway bridges. Other famous bridges are the Niagara (suspension), Forth railway bridge (cantilever), London Tower bridge (suspension), Tay railway bridge, Victoria Jubilee bridge across the St. Lawrence at Montreal (an open steel structure), Sydney Harbour bridge, Lower Zambezi bridge, Storstrom bridge in Denmark, Howrah bridge at Calcutta with the third largest cantilever span in the world, the Volta bridge of Ghana and the Auckland Harbour bridge both built in recent years, the Bix-Croft-Narrows bridge spanning New York's harbour from Brooklyn to Staten I. exceeding by 60 ft. the centre span of San Francisco's Golden Gate bridge. Britain is engaged in the largest bridge building programme for over a century. The road suspension bridge across the Firth of Forth completed in 1964 has the largest single span in Europe (3,300 ft.). The Midway bridge completed in 1963 is one of the largest prestressed concrete structures in the world. The Severn suspension bridge (from which the design principles for the new bridge across the Bosphorus were taken) and the Tay road bridge were completed in 1966 and the Tinsley viaduct near Sheffield was opened in 1980.

Britannia Metal an alloy of tin, antimony and copper harder than pure tin, corrosion resistant, used for teapots and jugs (often electroplated).

British Association for the Advancement of Science. This was founded in 1831 by a group of British scientists under the leadership of Charles Babbage (1792-1871) to stimulate scientific inquiry and promote research in the interest of the nation. Its meetings are held annually in different cities of the United Kingdom. It is divided into sections which include the chief physical and biological sciences, economics, anthropology and archaeology, psychology and education, engineering, forestry, agriculture, and there is also a division for studying the social and international relations of science. The 1971 meeting was to take place in Leicester under the presidency of Sir Alexander Cairncross.

British Museum. was created by an Act of Parliament in 1753 when the Sir Hans Sloane collection, which the British Government had acquired for £20,000, was added to the Cottonian Library and the Harley Manuscripts. It was opened to the public in 1759 at Montagu House, Bloomsbury. The acquisition of the library of George III. (now known as the King's Library) in 1823 made larger premises necessary, and the present building in Great Russell Street was completed in 1847 from designs by Sir Robert Smirke. The great domed Reading Room was opened in 1837 and the Natural History Department was transferred to South Kensington in the eighties. As a museum it is perhaps the

most famous in the world since apart from its colossal library of books and manuscripts it has many priceless collections of sculptures, antiquities, prints and drawings, coins and medals. *See also* **Libraries**.

British Railways. The name under which the railways of Britain were unified on January 1, 1948. Instead of the former four main railway systems six regions were formed: London, Midland region (former L.M.S.R.), Western (former G.W.R.), Southern (formerly S.R.), Eastern (southern area of former L.N.E.R.), N.E. region (N.E. of former L.N.E.R.), Scottish region (Scottish system of the former L.M.S.R. and L.N.E.R.). The most far-reaching change in the modernisation and re-equipment programme since 1955 has been the replacement of steam traction by electric and diesel locomotives. Under the chairmanship of Lord (then Dr) Richard Beeching the British Railways Board planned a viable railway system by closing un-economic branch lines by developing new services on the liner train principle and by utilising a more limited trunk route system. Under the Labour Government an integrated system of transport was worked out embracing rail, road, canals, shipping etc. itself integrated in the pattern of the country's social and economic needs. A 11,000 mile basic network was fixed (8,000 route miles previously proposed) with a further 2,500 miles under review. Unremunerative services, necessary on social grounds were to receive a Government subsidy. The name was changed to British Rail in 1964.

British Standard Time. The British Standard Time Act of 1968 put Britain an hour ahead of Greenwich Mean Time (GMT) throughout the year for an experimental 3 years. This brought Britain into line with countries in Western Europe where Central European Time is observed. In 1970 Parliament called for the restoration of the previous position—BST in the summer months and GMT in the winter months—as from 31 Oct. 1971.

Brocken spectre or glory. The series of coloured rings which an observer sees around the shadow of his own head (or an aeroplane in which he is travelling) as cast upon a bank of mist or thin cloud. This effect is produced by reflection and refraction of sunlight in minute water droplets in the air just as in a rainbow.

Bromine. A non-metal element, symbol Br, member of the halogen family (*qv*). It is a red, evil-smelling liquid (Greek *bromos* a stink). It is an abundant element. In the U.S.A. bromine is extracted from sea water on a large scale. It unites readily with many other elements the products being termed bromides. Its derivatives with organic compounds are used in synthetic chemistry. Bromoform is a liquid resembling chloroform. Bromides are used in medicine to calm excitement.

Bronze is primarily an alloy of copper and tin and was one of the earliest alloys known, the Bronze Age in the evolution of tool using man coming between the Stone Age and the Iron Age. Some modern bronzes contain zinc or lead also and a trace of phosphorus is present in phosphor bronze.

Bubble Chamber. An instrument used by physicists to reveal the tracks of fast fundamental particles (e.g. those produced in large accelerating machines) in a form suitable for photography, closely related to the Wilson cloud chamber (*qv*) but the particles leave trails of small bubbles in a supersaturated liquid (often liquid hydrogen) instead of droplets of liquid in a supersaturated gas. Invented in 1952 by the American physicist Dr D. Glaser. Nobel Prize man 1960 and developed by Prof L. W. Alvarez, Univ. of California, Nobel Prize man, 1968.

Buckingham Palace, London residence of British sovereigns since 1837. Originally built for the Duke of Buckingham (1705) bought by George III. in 1762 and remodelled by Nash 1825-36.

Buddhism. *See* 48.

Bulk Purchase. Arrangements for bulk purchase involve undertakings by a country or by some agency within it, to buy from another country specified quantities of its products, either at prices fixed in advance or with provision for

adjusting the prices at specified intervals to take account of general price movements. Such long term arrangements may be, but need not be combined with undertakings by the seller to buy specified quantities, or specified values, of the products of the purchasing country in exchange. The purpose of bulk purchase arrangements is, on the one hand to provide the seller of the goods in question with assured markets and on the other to assure the buyers of needed supplies of their goods.

Buntings name of a group of finches seed-eating birds, usually found in open country. The Yellowhammer Reed Bunting, Corn Bunting and Cirl Bunting are resident in Britain. The Snow Bunting (which breeds in small numbers in Scotland) and Lapland Bunting are regular winter visitors, and the Ortolan is among the rare visitors.

Butane, a colourless inflammable gas made of carbon and hydrogen formula C_4H_{10} . Found in natural gas and made as a by-product of oil refining. Butane, like propane (*q.v.*) can easily be liquefied and moved safely in cans and tanks. It is thus useful as a portable gas supply also used in internal combustion fuels.

Byzantine Art developed in the eastern part of the Roman Empire after Constantine founded the city of Constantinople (A.D. 330). It has many sources—Greek, Syrian, Egyptian and Islamic—and reached its zenith in the reign of Justinian (527–55). The major art form was ecclesiastical architecture, the basic plan of which was Roman—either basilican (symmetrical about an axis) or centralised (symmetrical about a point). Arched construction was developed and the dome became the most typical feature although, unlike the Roman dome which was placed on a round apartment, the Byzantine dome was placed on a square one on independent pendentives. Frequently small domes were clustered round a large one as in the case of the great church of Santa Sophia (537), the climax of Byzantine architecture. Usually the churches were small and include those of St. Sergius and Bacchus, St. Irene (in Constantinople), St. Vitale in Ravenna, and the much later and larger St. Mark's in Venice. Byzantine art also took the form of miniatures, enamels, jewels and textiles, but mosaics, frescos and icons (*q.v.*) are its greatest treasures.

C

Cacao, *Theobroma cacao* is an evergreen tree, from 15 to 20 ft. high, growing abundantly in tropical America, West Africa, the West Indies, Ceylon etc. yielding seeds, called cocoa beans, from which cocoa and chocolate are manufactured. The fruit is 7–10 in. long hard and ridged. Inside are the beans, covered with a reddish brown skin, which are first fermented, then dried. The trees mature at five to eight years and produce two crops a year.

Cactus, a family of flowering plants numbering about a thousand species adapted to living in very dry situations. The stem is usually fleshy being composed of succulent tissue, remarkably retentive of water, commonly equipped with sharp thorns which deter animals from eating them. The roots are generally very long, tapping soil water over large areas. A prickly pear cactus may have roots covering a circular area 25 ft. or more in diameter. The leaves are commonly insignificant or absent, and the stem takes over the photosynthetic leaf function and becomes accordingly flattened to expose greater area to sunlight and air. In some kinds of cactus (*e.g.* *Schinocactus*) the stem is shaped almost like a sea-urchin.

Cadmium, a metallic element, symbol Cd, chemically similar to zinc and mercury. Used in alloys to lower the melting point, as in Wood's metal with bismuth and tin. Alloyed with copper to make electric cables. Like zinc, it is a protective metal and is used in electro-plating. The cadmium-vapour lamp gives a characteristic frequency used in measuring wavelength.

Caesium, also spelt Cesium, is an alkali metal element, symbol Cs, in first group of the periodic table. It resembles rubidium and potassium and was discovered by Bunsen and Kirchhoff in 1860. It was the first element

whose existence was discovered spectroscopically. The caesium atom consists of a heavy nucleus surrounded by 55 electrons, 54 of which are arranged in stable orbits and one of which known as the valency electron, is in a less stable orbit surrounding them. Used in the construction of photo-electric cells and as an accurate time standard (atomic clock).

Calcium, a silvery white metallic element symbol Ca. It melts at 810° C and is very reactive. It was discovered by Sir Humphry Davy in 1808 but not until 1808 was it obtained pure by Moissan. Does not occur as metal in nature, but calcium compounds make up a large part of the earth's crust. Most important calcium sources are marble, limestone, chalk (all three are chemically calcium carbonate), dolomite which is the double carbonate of calcium and magnesium, gypsum, a hydrated calcium sulphate, calcium phosphate and calcium fluoride. Igneous rocks contain much calcium silicate. Calcium compounds are essential to plants and are used in fertilisers. Animals require calcium and phosphorus for bone and teeth formation. Deficiency is treated by administration of calcium phosphate. Strontium is chemically similar to calcium, and the radioactive strontium 90 from atomic fall-out is therefore easily assimilated by the body.

Calendar, a collection of tables showing the days and months of the year, its astronomical recurrences, chronological references, etc. The Julian Calendar with its leap year introduced by Julius Caesar fixed the average length of the year at 365½ days, which was about 11 minutes too long (the earth completes its orbit in 365 days 5 hours 48 minutes 46 seconds of mean solar time). The cumulative error was rectified by the Gregorian Calendar introduced in Italy in 1582, whereby century years do not count as leap years unless divisible by 400. This is the rule we now follow. England did not adopt the reformed calendar until 1752, when she found herself 11 days behind the Continent.

Calendar, the first day of the month in the Roman calendar, when interest fell due and proclamations as to the order of days were made.

Calorie, Unit of quantity of heat. The small or fundamental calorie is the amount of heat required to raise the temperature of 1 gram of water from 14.5 to 15.5°C. This is the gram calorie used in physics and chemistry. The large Calorie (written with a capital C) commonly used in nutritional communications, is equal to 1000 small calories and is called the kilogram calorie.

Calvinium. See JB.

Calypso, West Indian song in the form of a doggerel lampoon composed spontaneously and sung to a guitar.

Cambridge University had a sufficiently good teaching reputation to attract Oxford students in 1209 when lectures at their own university were suspended. In 1226 it had a Chancellor who was recognised by King and Pope. The first college to be founded was Peterhouse in 1284. The university was reorganised and granted a Charter of Incorporation by an act of Elizabeth in 1571. The colleges with their dates of foundation are: Christ's (1505), Churchill (1800), Clare (1236), Clare Hall (1866), Corpus Christi (1352), Darwin (1964), Downing (1806), Emmanuel (1584), Fitzwilliam (1566), Gonville and Caius (1348), Jesus (1496), King's (1441), Magdalene (1542), Pembroke (1847), Peterhouse (1284), Queens (1448), St. Catharine's (1473), St. Edmund's House (1896), St. John's (1511), Selwyn (1882), Sidney Sussex (1596), Trinity (1546), Trinity Hall (1850), University (1966). The women's colleges are: Girton (1869), Newnham (1775), New Hall (1864), Hughes Hall (formerly Cam. Bridge T.C.) (1885) and Lucy Cavendish College (1966) (for women research students and other graduates). Women were admitted to degrees (though not allowed to sit for examination) in 1920, and to full membership of the University in 1948.

Camel, a large ruminant quadruped, inhabiting Asia and Africa, where it is largely used as a beast of burden. There are two species—the Arabian camel or dromedary with only one hump, and the Bactrian, or double-humped camel. There are no wild dromedaries, and the

only wild bactrians occur in the Gobi Desert. The camel is able to go for long periods without water not as was formerly believed because it stored water in its hump but because of the unique mechanism of its physiology which enables it to conserve water at the expense of not sweating until 104° F is reached.

Campanile or bell tower is separate from but usually adjoining its parent church. The most famous are in Italy. Giotto's tower at Florence adjoining the cathedral of Santa Maria del Fiore is architecturally the finest in the world. Others are at Cremona the loftiest in Italy (364 ft.) and Pisa (the leaning tower). The magnificent pointed campanile of St. Mark's Venice, which collapsed in 1902 and has since been rebuilt in its original form was begun in 902.

Canal an artificial watercourse used for navigation which changes its level by means of locks. The completion of the Bridgewater Canal in 1761 to take coal from Worsley to Manchester marked the beginning of canal building in industrial Britain. There are some 2,500 miles of navigable inland waterways in Great Britain today 1,850 miles of which are under the control of the British Waterways Board set up by the Transport Act, 1962. The English network is based on the four great estuaries Mersey, Humber, Severn and Thames. Under the Transport Act 1968 the Board is enabled to maintain an extensive network of amenity waterways.

Canary a light sweet wine from the Canaries and chief export until the grape blight of 1853. Much consumed in Britain from Tudor to Georgian times. Also a cage bird. See 222.

Candela, unit of luminous intensity, symbol cd (198). An American unit the value which this unit represents may be gained from the fact that light obtained from a 40 W filament type electric lamp or bulb is approximately the same as would be given by a point source of luminous intensity 30 cd.

Candelmas an English and Roman Church festival in celebration of the Purification of the Virgin Mary. The date is February 2.

Canon, a term applied to signify a recognised rule for the guide of conduct in matters legal, ecclesiastical and artistic or an authoritative ordinance thus we have Canonical Scriptures, Canon Law etc. A Canon is also a dignitary of the Church usually a member of a cathedral chapter in the Anglican communion or in the Roman Church a member of an order standing between regular monks and secular clergy.

Canonical Hours were seven in number in the Western Church. Matins and Lauds before dawn. Prime early morning service. Terce 9 a.m. Sext noon. None 3 p.m. Vespers, 4 p.m. Compline bed time.

Canonisation the entering of one of the faithful departed on the list of saints of the Roman Catholic Church. The rules governing canonisation were simplified by papal decree in 1969. The forty English martyrs of whom Edmund Campion was one, executed between 1535 and 1579 and beatified long ago were canonised in 1970. Beatification by which a person is called blessed is usually followed by canonisation but not necessarily.

Canticles, the name given to the scriptural passages from the Bible sung by the congregation in the various Christian liturgies. They are the *Benedictus*, *Magnificat*, *Nunc Dimittis*.

Capercaillie, the largest of the grouse family found in the Scottish highlands and the pine forests and mountainous regions of Northern and Central Europe and Asia.

Capet, the family name of the royal house of France founded by Hugh Capet in 987 with its collateral branches. The main line of the dynasty came to an end in 1328 with the death of Charles IV when the throne passed to the related house of Valois. The direct Valois line ended in 1498 with the death of Charles VIII. The first of the Bourbon line was Henry IV whose descendants ruled France (except during the French Revolution and the Napoleonic era) until 1848.

Capitalism. See 99.

Carthuins are members of a mendicant order of Franciscans, founded in the 16th cent. with the aim of restoring the primitive and stricter observance of the rule of St. Francis, so called

from the capuce or pointed cowl worn by them. **Carat**, a term used in assessing the value of gold and precious stones. In connection with gold it represents the proportion of pure gold contained in any gold alloy and for this purpose the metal is divided into 24 parts. Thus 24 carat indicates pure gold and any lesser number of carats shows the proportion of gold contained in the alloy. The carat as a measure of weight is now obsolete having been replaced by the metric carat of 0.2 grams.

Caravan, a band of travellers or traders journeying together for safety across the Eastern deserts sometimes numbering many hundreds. There are several allusions to caravans in the Old Testament. The great caravan routes of this period from Egypt to Babylon and from Palestine to Yemen linked up with the Syrian ports and so with western sea commerce. Many wars have been fought in the past over their control.

Carbohydrates. See P40 F23. **Carbon** a non-metallic chemical element which occurs in crystalline form as diamonds and graphite. amorphous forms of carbon include charcoal and soot while coke consists mainly of elementary carbon.

Carbon is a non-metallic chemical element which occurs in crystalline form as diamonds and graphite. amorphous forms of carbon include charcoal and soot while coke consists mainly of elementary carbon. The biochemistry of plants and animals largely hinges upon carbon compounds. The study of carbon compounds is called Organic Chemistry. Carbon 14, a radioactive isotope of carbon with a half life of 6,000 years used in following the path of compounds and their assimilation in the body. Also used in determination of the age of carbon containing materials such as trees fossils and very old documents. See F24.

Carbonari, members of a secret political society originated in Naples and at one time very numerous. Their chief aim was to free Italy from foreign rule and they exerted considerable influence in the various revolutionary movements in the first half of the 19th cent. Their name was adopted from the charcoal burners (*carbonari*) and their passwords signs etc were all in the phraseology of the fraternity.

Carbon dioxide. Commonest of the oxides of carbon. It is formed when carbon and its compounds are burnt with abundant supply of air and when carbon compounds are oxidised in the respiration process of animals. The atmosphere contains carbon dioxide to the extent of about three parts in 10,000. This figure remains more or less constant because while carbon dioxide is always being added by animal respiration and the burning of fuels such as coal and oil by man plants are constantly removing it in the process known as photosynthesis (F28) or carbon assimilation.

Carbon monoxide is a colourless gas with no taste or smell. It is formed when coal and coke are burnt with a restricted supply of air. The blue flame to be seen in a coke brazier for instance is the flame of carbon monoxide. This gas is very poisonous forming with the haemoglobin of the blood a compound which is useless for respiration and cherry red in colour which gives a visible symptom of poisoning by carbon monoxide. With nickel it forms a volatile compound called nickel carbonyl and this reaction is the basis of the Mond process for extracting nickel.

Cardinal, one of the chief dignitaries of the Roman Catholic Church who constitute the Pope's council or Sacred College and when the papal chair is vacant elect a Pope from among them. There are three orders: cardinal bishops, members of the Roman Curia (the central administration of the Church) and bishops of sees near Rome, cardinal deacons, also members of the Curia holding titular bishoprics and cardinal priests who exercise pastoral duties over sees removed from Rome though some are members of the Curia. Their numbers were fixed by Pope Sixtus V in 1586 at 6, 14 and 50 respectively. Both Pope John XXIII and Pope Paul VI increased the number and since 1969 there have been 136, the highest number in the history of the Church. Their insignia was trimmed off by papal decree in 1969 with the abolition of the famous red hat (the galero) and the shoes with buckles. Cardinals must now retire at 80.

Cardinal Virtues, according to Plato these were justice, prudence, temperance, fortitude—

natural virtues as distinct from the *theological* virtues of the Roman Catholic Church faith hope charity. The phrase seven cardinal virtues combining the two figures in medieval literature. See *Sins Seven Deadly*. Carmelites a body of mendicant friars taking their name from Mount Carmel where the order was first established in the 12th cent. The original rule of the order required absolute poverty abstinence from meat and a hermit life. The rigidity of the rule of the order was mitigated by Innocent IV. They wear a brown habit with white mantle hence their name of White Friars. The order of Carmelite nuns was instituted in the 16th cent.

Carolingians dynasty of Frankish rulers founded in the 7th cent. The family was at its height when represented by Charlemagne. It ruled with interruptions until 987 when the Capetian dynasty succeeded.

Carp a well known fresh water fish found in plenty in most European and Asiatic still waters reaches a length of about 2 ft. and under favourable conditions lives for about 40 years. Familiar British members of the family are the roach rudd dace chub gudgeon tench minnow barbel bream and bleak. The goldfish popular in ornamental ponds, is the domesticated variety of a Far Eastern member of the carp family.

Carthusians an order of monks founded in 1084 by St. Bruno of the Grande Chartreuse near Grenoble and introduced into England about a century later. They built the Charterhouse (corruption of Chartreuse) in London in 1371. The chief characteristics of the order are a separate dwelling house in the precincts of the charterhouse for each monk, and the general assembly in the Church twice in the day and once at night. They wear a white habit with white scapular and hood. The liquor *Chartreuse* was invented by the order and is still their secret. For many years they have derived large revenues from its sale. The order of Carthusian nuns was founded in the 12th cent.

Caselin the chief protein in milk and cheese. It is coagulated by the action of rennet or acid. An important class of plastics (casein plastics) are produced from it and these plastics are converted into buttons, knitting needles, etc. 8000 gallons of milk yield about a ton of casein.

Cassowary a genus of ostrich like birds which, together with the emu, form a separate order found only in Australasia. All species are black, with brightly coloured necks, and with a horny crest on the head. Noted for ferocity.

Castor-oil Plant (*Ricinus communis*) an African shrub now cultivated in most tropical countries. It has broad palmate leaves and bears a spiny fruit containing seeds which when pressed yield the well known oil.

Cat, the general name for all members of the class *Felidae* of the carnivorous order from the lion down to the domestic cat. The latter is believed to be descended from the European and African wild cats. Egypt is credited with having been the first country in which the cat was domesticated. See 229-12.

Catabolism *Anabolism*, are the terms used to describe the two types of metabolic pathway. Catabolic pathways are routes by which large organic molecules are broken up by enzymes into their simpler constituents *e.g.*, starch into glucose. The anabolic pathways are the routes by which complex molecules are synthesised from simple sub-units, *e.g.* proteins from amino acids.

Catalyst, A substance which speeds up a chemical reaction without being changed itself. Various aluminium and titanium compounds are catalysts in the formation of polythene from ethylene. Palladium catalyses the reaction of hydrogen with oxygen (hence its use in gas lighters). Enzymes in the body hasten the breakdown of carbohydrates and proteins by catalytic action. See F94(3).

Cataracts are gigantic waterfalls. The most famous are those of Niagara in North America, the Orinoco in South America, the Victoria Falls on the Zambesi in Africa, the Falls of the Rhine at Schaffhausen, and the Cascade of Gavarni in the Pyrenees.

Catechism, an elementary book of principles in any

science or art but more particularly in religion in the form of questions and answers. There is a great variety of these including the Lutheran prepared by Luther in 1529 Calvin's Geneva (in 1536) and the Anglican in the Book of Common Prayer.

Catenary the name of the curve taken up by a flexible uniform chain or clothes line supported at its two ends.

Caterpillar the larva of a butterfly or moth worm like in its segmented body with a pair of jointed true legs often curiously marked and coloured and frequently more or less hairy.

Cathedral, the chief church of a diocese so called from its containing a Bishop's seat or *cathedra* chair. The town in which it is situated is a cathedral city. Some celebrated cathedrals are St John Lateran of Rome Notre Dame of Paris the cathedrals of Cologne and Milan St Paul in London Canterbury Cathedral York Minster and the cathedrals of Durham Bristol Gloucester Peterborough Exeter Liverpool and Coventry (destroyed by bombs now rebuilt).

Catholicism See 39.

Cat's-eye a kind of quartz much valued as a gem opalescent and of various shades.

Cavalier a name adopted during the troubles of the Civil War to designate the Royalist party. It is also used generally in reference to a knightly gallant or imperious personage.

Caves natural hollow places in the earth frequently found in Carboniferous limestone areas. The underground caves are formed by the action of rainwater carrying carbon dioxide a dilute acid which slowly attacks the limestone rocks. The main caves in the British Isles are in the Mendips Derbyshire Yorkshire Wales and in County Clare. The floods of Sept 1963 moved masses of debris in some of the British caves redistributing it in a major way new routes were blocked and old passages reopened. The scientific study of caves is known as speleology.

Cedar a dark leaved, cone-bearing horizontal branched evergreen tree that grows to a considerable height and girth, the best known species in Britain being the Cedar of Lebanon which was introduced in the 17th cent.

Celluloid, one of the first synthetic thermoplastic materials, discovered by Alexander Parkes in 1865 when he was attempting to produce synthetic horn. It is made by treating cellulose nitrate with camphor and alcohol. Photographic film is made of a similar but less inflammable material formed by the use of cellulose acetate instead of the nitrate.

Cellulose, a carbohydrate, and a constituent of nearly all plants. Cellulose occurs in an almost pure state in the fibres of linen (flax) absorbent cotton jute and filter-paper (used in laboratories).

Celsius was an 18th cent. Swedish scientist (B13) after whom the modern Celsius temperature scale is named. Since 1964, °C stands for degree Celsius instead of degree Centigrade but this is only a change in name. Both symbols refer to the temperature scale which calls the melting point of ice 0°C and the boiling point of water at one atmosphere pressure 100°C. See Absolute Temperature.

Celts, an ancient race of W. Europe originally from southern Germany (2nd millennium B.C.) united by a common language and culture who spread westward into Spain, northward into Britain, eastward to the Black Sea, reaching Galicia in Asia Minor. The *La Tene* Iron Age Celts invaded Britain 250 B.C. After Britain was conquered by the Romans and invaded by the Angles and Saxons there remained as areas of Celtic speech only Wales (Brythonic speakers) Ireland, Scotland, Isle of Man (Gaelic speakers). The late Celtic period in Britain produced a distinctive Christian art (*e.g.*, the Lindisfarne Gospel c. 700, and the Irish Book of Kells, dating from about the same time).

Centrifuge, a machine which produces large accelerations by utilising the radial force caused by rotating a body about a fixed centre. Centrifuges have found extensive application in modern science. They can be used for the separation of one size of particles from another (for this use in biochemistry see F80) or in the training of astronauts where the accelerations

occurring during rocket lift-off can be simulated in a centrifuge on the ground.

Ceramics are substances in which a combination of one or more metals with oxygen confers special and valuable properties. These include hardness and resistance to heat and chemicals. Ceramic comes from the Greek word for pottery and pottery materials of mud and clay were probably the first man made ceramics. Nowadays the range is enormous and growing apart from all the pottery materials there are fire bricks, gems, glasses, concretes, nuclear reactor fuel elements, special materials for electronic devices, coloured pigments, electrical insulators, abrasives and many other things. The scientific study of ceramics is part of materials science (see *Materials Science*). The need to design ceramic objects has inspired great art and the production of ceramics is a major industry.

Cerium a silvery metallic element discovered by Berzelius in 1803. A mixture of cerium and thorium nitrides is used in the manufacture of gas mantles which owe their incandescent property to the deposit of cerium and thorium oxide with which they are coated.

Chain reaction See F18(1).

Chalcedony a mixture of crystalline silica and amorphous hydrated silica of quartz and opal. It has a waxy lustre and is much used by jewellers for necklaces, bracelets etc. Commonly it is white or creamy. Its bright orange red variety is called carnelian, its brown variety sard. Chrysoprase, a plasma blood-tone art varieties which are respectively pale apple green, dark leaf green, green with red spots.

Chalk a white limestone, calcium carbonate found in the Upper Cretaceous deposits (formed from the shells of minute marine organisms). In southern England the chalk is a soft rock but in Yorkshire, Scotland and Ireland it is solid limestone. French chalk is hydrated magnesium silicate, a variety of talc.

Chamberlain Lord, the senior officer of The Royal Household who is responsible for all ceremonial within the palace (levees, courts, garden parties, entertainment of foreign royals and heads of state) but not the coronation or state opening of parliament. He is also in charge of appointments to The Royal Household. His office as censor of plays was abolished in 1968.

Chamberlain Lord Great one of the great officers of state whose duties are now mainly ceremonial. He attends the monarch at the state opening of parliament and at the coronation and is custodian of the Palace of Westminster (House of Parliament). The office is hereditary dating from Norman times and is held for one reign in turn by the descendants of the De Vere Earls of Oxford.

Chameleons, a family of lizards with numerous species. Their ability to change colour is well known but exaggerated, and is due to the movement of pigment cells beneath the skin. They are slow in movement, arboreal and mainly insectivorous. Found in Africa, India, Ceylon, Madagascar and Arabia.

Chamois, a species of antelope, native of Western Europe and Asia. About the size of a goat it lives in mountainous regions and possesses wonderful leaping power so that it is very difficult to capture. Its flesh is much esteemed and from its skin chamois leather is made although to-day sheep and goat skins are usually substituted. The mating season is Oct-Nov and the fawns are born in May or June. Live to be 20-25 years old.

Channel Tunnel, a scheme to bore a tunnel through 39-50 miles of chalk under the sea between Dover and Calais has been a subject for discussion ever since Albert Mathien first conceived the idea as a practical possibility in 1802. In the 1890s proposals for a bridge were made. Investigations have been undertaken from time to time, the most recent being that of the Channel Tunnel Group composed of British, French, and American interests which was set up in 1967. In 1964 it was announced that the British and French Governments had decided in principle to go ahead with a rail tunnel, thus accepting the recommendations of the Anglo-French study group published in 1963. In 1968 the Minister of Transport said that if studies

confirmed the case for the tunnel it should be possible to complete it by 1978. It is to be financed by private capital but operated by a Franco-British public authority. Estimated cost (1968) £300 million. The ferry terminal is expected to be at Cheriton, the passenger terminal near Saltwood, both near Folkestone and the freight terminal at Stanford or Sevington both situated between Folkestone and Ashford.

Chapel Royal the church dedicated to the use of the Sovereign and Court. There are among others chapels royal at St James's Palace, Buckingham Palace, Windsor, Hampton Court, the Tower and Holyrood. See also E4(2).

Characterology See J9.

Charcoal a term applied to wood that has been subjected to a process of slow smothered combustion. More generally it refers to the carbonaceous remains of vegetable animal or combustible mineral substances submitted to a similar process. Charcoal from special woods (in particular buckthorn) is used in making gunpowder. Bone charcoal finds use in sugar refining as it removes dark colouring matter present in the crude syrup.

Chasuble a sleeveless vestment worn by ecclesiastics over the alb during the celebration of Mass. It is supposed to symbolise the seamless coat of Christ.

Cheese an article of food made from the curd of milk which is separated from the whey and pressed in moulds and gradually dried. There are about 500 varieties differing with method of preparation and quality of milk. They used to be made in the regions after which they are named but nowadays many of them are mass produced. *e.g.* Cheddar is made not only in all parts of Britain but in Canada, New Zealand, Australia, Holland and the U.S.A. Cheeses may be divided into 3 main classes: (1) soft *e.g.* Camembert, Cambridge Port, l'Évêque; (2) blue veined *e.g.* Stilton, Gorgonzola, Roquefort (made from ewe's milk); (3) hard pressed, *e.g.* Cheddar, Cheshire, Gruyère, Parmesan, Gouda.

Cheetah or hunting leopard, the large spotted cat of Africa and Southern Asia whose ability to run at 45 m.p.h. for 500 yards makes it the swiftest four footed animal alive.

Chemistry is the science of the elements and their compounds. It is concerned with the laws of their combination and behaviour under various conditions. It had its rise in alchemy (J2) and has gradually developed into a science of vast magnitude and importance. Organic chemistry deals with the chemistry of the compounds of carbon, inorganic chemistry is concerned with the chemistry of the elements, physical chemistry is concerned with the study of chemical reactions and with the theories and laws of chemistry. See F20-6.

Chestnut the fruit of the chestnut tree, those of the Spanish chestnut *Castanea vesca* furnish a favourite esculent. The wood is used in carpentry while the horse chestnut (*Aesculus hippocastanum*) is much employed in brush mounting and in cabinet work.

Chiaroscuro a term used in painting to denote the arrangement of light and shade in a picture.

Chiltern Hundreds three hundreds—Stoke, Burnham and Desborough—the stewardship of which is now a nominal office under the Chancellor of the Exchequer. Since about 1751 the nomination to it has been used as a method of enabling a member of Parliament to resign his seat on the plea that he holds an office of honour and profit under the crown. (This has been a disqualification for Parliament since 1707.)

Chimpanzee a large anthropoid ape, a native of tropical West Africa, of a dark brown colour with arms reaching to the knee and capable of walking upright. Its brain is about a third of the weight of the human brain, but is anatomically similar. The animal has considerable intelligence and powers of learning. A suitable subject for space flight experiments.

China Lobby, the name applied to the body of opinion and pressure in American politics which strenuously opposes recognition of Communist China, and advocates support of Chiang Kai-shek.

Chinchilla, a South American burrowing rodent

Grey in colour and white underneath. It is greatly esteemed for its beautiful fur.

Chippendale Furniture was introduced in the reign of George I. by Thomas Chippendale a cabinet maker from Yorkshure who migrated to London and set up for himself in St. Martin's Lane.

Chiring Cross He was fonder of inventing designs for furniture than of making it, and in 1752 published a book of patterns. The London furniture makers of the day soon began to model their work upon it.

Chivalry an international brotherhood of knights formed primarily during the 13th cent to fight against the infidels in the Crusades. For the French the major battle was against the Moors in the Holy Land and North Africa. The Spaniards fought the same enemy in their own country and the Germans were concerned with the heathen of Baltic lands but Chaucer's very perfect gentle knight had fought in all these areas. One did not easily become a knight who had to be of noble birth and then pass through a period of probation beginning as a boy page in the castle of some great lord serving his elders and betters humbly while he was taught good manners singing playing musical instrument and the composition of verse. Probably he learned Latin but he certainly learned French which was the international language of knights as Latin was of scholars. At fourteen he became a squire and learned to fight with sword, battle axe and lance and to endure conditions of hard living while carrying out his duties of waiting on his lord looking after his horses and in time accompanying him in battle. Only if he showed himself suitable was he finally knighted by a stroke of the hand or sword on the shoulder from the king or lord. Knighthood was an international order and had its special code of behaviour to honour one's sworn word to protect the weak to respect women and defend the Faith. To some extent it had a civilising effect on the conduct of war (e.g. knight of opposing sides might slaughter each other in battle but feast together after) but since war was regarded as the supreme form of sport it cannot be said to have contributed to peace.

Chlorine a gaseous element of the halogen family first isolated in 1774 by Scheele by the action of manganese dioxide on hydrochloric acid. It unites easily with many other elements, the compounds resulting being termed chlorides. The gaseous element is greenish yellow with a pungent odour. It is a suffocating gas having the same effect on the conduct of war (e.g. 50,000 and was used during the first world war as a poison gas. Has a powerful bleaching action usually being used in form of bleaching powder made by combining lime and chlorine. Also a valuable disinfectant used for instance in rendering water of swimming baths sterile.

Chloroform a volatile colourless liquid composed of carbon hydrogen and chlorine. It is a powerful solvent not naturally occurring but synthesised on a large scale. When the vapour is inhaled it produces unconsciousness and insensibility to pain. It owes its discovery to Liebig and its first application for medical purposes to Sir James Young Simpson (F5(2)).

Chlorophyll, the green pigment contained in the leaves of plants, first discovered by P. J. Pelletier (1788-1829) and J. B. Caventou (1795-1877) in 1818. Enables the plant to absorb sunlight and so to build up sugar. The total synthesis of chlorophyll was reported in 1960 by Prof. R. B. Woodward. This is an outstanding achievement in the field of organic chemistry. See **Photosynthesis**, F53.

Chouans the name given to the band of peasants mainly smugglers and dealers in contraband salt who rose in revolt in the west of France in 1793 and joined the royalists of La Vendée. Balzac gives a picture of the people and the country in which they operated in his novel *Les Chouans*. They used the hoot of an owl as a signal—hence the name.

Chough, a member of the crow family of glossy blue-green-black plumage, whose long curved bill and legs are coral red. It used to be abundant on the cliffs of Cornwall but its haunts are now restricted to the rocky outcrops of the western coasts and in the mountains near by. It nests in cleft rocks and caves. The Alpine

chough with yellow bill inhabits the mountainous districts of Europe and Asia and is not found in Britain. It was found at 27,000 ft on Everest.

Christmas means mass of Christ from the old English *Crætes mæsse* which is celebrated by the Western church on December 25. The actual day on which Christ was born is not known and there is some uncertainty about the year December 25 as the day of Nativity was not generally observed until the 5th cent. A.D. though as the winter solstice it had long been observed as a pagan festival of *sol invictus* (sun conquered sun). The first Christmas card dates from about 1843 and the Christmas tree of pagan origin was introduced into England from Germany where it had been a tradition since the Middle Ages. Santa Claus is a corruption of *santa Nikolaus* (St. Nicholas) patron saint of children whose feast day properly falls on December 6.

Chromatic Scale a scale proceeding in intervals of one semitone. E.g. chromatic scale in C: C-D-D- \sharp E-E-F-F-G-G-A-A-B-B-C.

Chromium a very hard bluish white metal element symbol Cr melting at a very high temperature (above 1900°C). Its chief ore is chromite or chrome iron-ore (*ferrite chromite*).

Ferro-chrome is produced by heating chromite and anthracite in an electric furnace and the chrome steel is prepared by adding the pre-calculated amount of ferro-chrome to melted steel. Best known chrome steels contain less steel first made by Bessemer in 1852 and since then developed greatly at Sheffield. A typical formula is 18 per cent chromium 8 per cent nickel 74 per cent iron. Equally important are Stellite alloys (containing chromium cobalt tungsten or molybdenum) which have made possible modern high speed cutting tools. Dies used in manufacture of plastics are commonly of chrome steel. The elementary metal finds little use alone except in chromium plating for motor cars etc.

Chromosomes, the structures contained within the nucleus of every animal and plant cell by which genetic information is transmitted. The chromosome number in somatic (body) cells is constant for each species of plant and animal: e.g. man (46) cat (38) mouse (40) honey bee (16) fruit fly *Drosophila* (8) potato (48). Chromosomes are long molecules composed of deoxyribonucleoproteins (DNA) and proteins (RNA). Human chromosomes have been the subject of much recent research since it has been found that certain disorders are associated with chromosomal aberration: e.g. in Mongolism an extra chromosome is present. See also **Genes**, Cell Division F30(2).

Church Commissioners The Church Commissioners were established in 1948 by the amalgamation of Queen Anne's Bounty (established 1704) and the Ecclesiastical Commissioners (established 1836) to administer Church revenues and to manage Church property generally. The Commissioners own investments and real estate a total of over £400 million.

Church of England. See J11.

Cid, the famous Spanish hero of the 11th cent. Don Rodrigo Diaz de Vivar who, before he was twenty led a Spanish force against the Moors and drove them out of Spain. He is celebrated in poem play and romance.

Cilia, minute hair-like projections on the surface of some cells, which beat together in wavelike movements like the wind over a corn field. These movements can be used as a means of locomotion as in the aquatic organism *paramecium*. Cilia are also found on the outer layers of the human trachea where they waft particles upwards to the throat, thus protecting the lungs. See F34, F31 also **Flagella**.

Cinchona, the tree native to the Andes which is famous for its bark source of the drug quinine. It was introduced into Ceylon, India and Java the latter becoming the main supplier of quinine.

Cinque Ports, a number of seaport towns on the coast of Kent and Sussex, originally five: Hastings, Romney Hythe, Dover, Sandwich. Winchelsea and Rye were added later. These ports were required to furnish a certain number of ships, ready for service, and in return

they were granted many privileges. The official residence of the Lord Warden (Sir Robert Menzies) is Walmer Castle near Dover.

Cistercians an order of monks and nuns taking their names from Cîteaux near Dijon where their first monastery was established in 1099. The order was noted for the severity of its rule. They were famous agriculturists. The habit is white with a black cowl or hood. The order declined, and in the 17th cent. there was a reform movement instituted by the Trappists who were later organised into a separate order.

Citron a species of citrus (*Citrus medica*) related to the lemon, whose fruit has thick rind used for candied peel.

Civil List is the annual sum payable to the Sovereign to maintain the Royal Household and to uphold the dignity of the Crown. The amount is granted by Parliament upon the recommendation of a Select Committee and has to be settled afresh in the first six months of a new reign. The Civil List of Queen Victoria was £285 000. Edward VII and George V £470 000. Edward VIII and George VI £410 000. Elizabeth II £470 000. The annuities payable to members of the Royal Family do not form part of the Civil List but are a charge on the Consolidated Fund. Queen Mother £70 000. Duke of Edinburgh £40 000. Duke of Gloucester £35 000. Princess Margaret £15 000. Prince Charles has his own income from the Duchy of Cornwall (£220 000 a year) half of which he passes to the Fifechequer. The other royal children will receive state allowances when they are 21. Apart from the Civil List, the Consolidated Fund grants revenue from the Duchy of Cornwall, the official income of the monarchy includes the sums which Parliament votes to Government departments every year and revenue from the Duchy of Lancaster. The royal finances are being reviewed in 1971.

Cleopatra's Needle on the Thames Embankment is of the time of Ptolemy III (1500-1450 B.C.). The monolith had nothing to do with Cleopatra as it only came to Alexandria after her death. It was first erected at the Biblican On (Greek Heliopolis) sacred City of the Sun. It was presented to the British Government by Mehmet Ali in 1819, but not brought to this country until 1875. Weight 150 tons, height, 68 ft.

Climate is a generalised representation of the day to day weather conditions throughout the year, the combination of all weather thus determining the climate of a place. Averages and extremes of temperature, variation of humidity, duration of sunshine and cloud cover, amount of rainfall and frequency of snow, frost, gales, etc. are amongst the data normally investigated. The interiors of great land masses are characterised by large ranges of temperature and low rainfall (continental climate) while proximity to oceans has an ameliorating effect with increase in rainfall (oceanic climate). Presence of mountain ranges and lakes and configuration generally produce local modifications of climate also apparent between the centre and the outlying suburbs of a city. There is evidence that vast changes of climate have occurred during geological time. Since the mid 19th cent. most of the world has shown a tendency to be warmer, the rise in annual mean temperature is now over 1°C. But this trend now seems to be easing off. Latitude introduces zones of climate, e.g. tropical rain, subtropical steppe and desert, temperate rain and polar.

Clock, a device for measuring the passage of time. The earliest timekeeper was a shadow-clock, a primitive form of sundial used in Ancient Egypt about 1500 B.C. To find the time at night the water-clock or clepsydra was used. The sand glass dates from the 15th cent. No one knows when the first mechanical clocks were invented, but it is known that a complicated mechanical clock driven by water and controlled by a weight-driven escapement was built in Peking in 1090. The Dover Clock in the Science Museum is not the earliest surviving clock in England, as was once believed, but early 17th cent. The Salisbury Cathedral clock dates from 1386 and that of Wells Cathedral from 1392. The pendulum clock was invented

by the Dutch scientist Christiaan Huygens (1629-95). The first watches were made in Nuremberg shortly after 1500. The marine chronometer is a high precision timepiece used at sea for giving Greenwich mean time. The quartz crystal clocks are accurate to one thousandth of a second a day and the improved atomic clock recently developed at the British National Physical Laboratory, which makes use of the natural vibrations of the caesium atom, is said to be an almost absolute measure of time (about rate to 1 sec in 300 years i.e. one part in 10^{16}).

Cloisonné a kind of fine pottery with enamelled surface decorated with elaborate designs the outlines of which are formed by small bands or fillets of metal. The Byzantines excelled in this work but in the 20th cent. Japan and China led in Cloisonné ware.

Cloud chamber an apparatus invented by C.T.E. Wilson in which the tracks of atomic particles can be made visible. Just as the vapour trail left by the track of an invisible aircraft high up in the air so the vapour trails of an unseeable particle can tell of its behaviour. The rays under investigation pass through a chamber containing a gas e.g. air thoroughly cleansed of dust supersaturated with water or alcohol vapour. As the particle passes through it forms a track of tiny water droplets which can be photographed. After a long and honourable history this wonderful instrument is now virtually obsolete. A later ingenious device for tracking fast fundamental particles is the Bubble chamber (q.v.).

Clouds are formed by the ascent of moist air the type depending on the way the air ascends and the height at which condensation occurs. There are three main classes: (1) high cloud (above 20 000 ft.)—cirrus (delicate and fibrous), cirrostratus (thin white veil) and cirrocumulus (delicately rippled) consisting of ice crystals. (2) medium cloud (above 7 000 ft.)—altostratus (dense, greyish veil) and altocumulus (broken flattened cloudlets)—chiefly water particles often supercooled. (3) low cloud (from near ground to 7 000 ft.)—cumulus (fair weather broken dome topped), cumulonimbus (heavy towering to great heights), stratocumulus (layer of globular masses or rolls), stratus (like fog but off the ground), nimbostratus (low rainy cloud). The highest clouds of all and the rarest are the noctilucent seen only on summer nights in high latitudes. They form at about 50 miles above the earth and consist of ice-coated dust from meteors.

Clover plants of the *Trifolium* genus, family Leguminosae, with about 250 species. These are nitrogen fixing plants and include red clover, white clover, alsike clover, and crimson clover. They are of great importance in agriculture because in a good pasture they supply directly or indirectly most of the protein available to the animals. Seed of 'wild white' clover has been accepted since about 1939 as the indispensable plant of good United Kingdom grassland, largely through the efforts of pioneers like D.A. Gilchrist (1859-1927).

Cloves are the dried flower buds of a species of myrtle (*Eugenia caryophyllata*) grown principally in Zanzibar and Madagascar.

Coal Until recently the most important single fuel has been coal. It is a mineral of organic origin, formed from the remains of vegetation which over millions of years has changed to coal by the effects of heat and pressure from overlying rock or water. All coal contains moisture, inflammable volatiles, mineral impurities (some of which remain as coal ash after the coal is burnt), and fixed carbon (the coke that is left after the volatiles have been driven off). The relative proportions vary—from Anthracite, a hard coal containing the highest proportion of fixed carbon, to Lignite or brown coal which is little more than a hard peat. World reserves of bituminous coal have been estimated at 7.5×10^{13} tons. If one adds the reserves of brown coal and lignite, this figure is increased by about 15 per cent. The proportion of the reserves that could be economically recovered varies from country to country and estimates vary from 50 to 100 per cent of the reserves. The reserves are highly localised—over half

being located in the Soviet Union. In the United Kingdom coal has formed the basis of past industrial prosperity. Peak output occurred in 1911 when 287 million tons were mined, one third of which was exported. At the end of the Second World War (1946) production had fallen to 183 million tons and was far below demand. During the next ten years great efforts were made to increase output but quite suddenly in 1946 demand for coal fell as oil became a popular fuel and since then the problem has been to cut back the coal industry without causing undue social problems. A future market of about 170 to 180 million tons is envisaged beyond 1970. In 1947 the British coal industry was brought under public ownership and all assets were vested in the National Coal Board. Coal of Arms in heraldry is a vice containing a family's armorial bearings. In medieval times it was an actual coat upon which such device was embroidered and knight wore it over the armour.

Cobalt a white metal melting at 1490 C. Two main ores are *cobalt glance* (in which the element is combined with arsenic and sulphur) and *smallite* (cobalt arsenide). The principal ores are Ontario and the Congo. Various cobalt alloys are important e.g. steel, ferro-cobalt and carbonyl. Its monoxide is an important colouring medium and is used for colouring glass and porcelain blue.

Cobra hooded and very venomous snakes. The best known species are the Indian Cobra, the Egyptian Cobra and the Black-necked Cobra. Their food consists chiefly of small rodents. The King Cobra is almost exclusively a snake-eater. Spitting Cobras (or Ringhals) of S. Africa are a related genus capable of spitting their venom several yards.

Coca a S. American shrub *Psychotryon coca* also cultivated in Java. The leaves yield cocaine classified as a dangerous drug, used medicinally as a local anesthetic especially on the eyes and in dentistry. When the natives chew the leaves they are enabled to withstand astonishing amounts of hunger and fatigue as cocaine acts both as a mental stimulant and as an anaesthetic on the mucous lining of the stomach.

Cochineal or Carmine a dyestuff consisting of the dried bodies of the female scale insect (*Dactylopus coccus*) which feeds on cacti. Of ancient origin the dye was well known to the Aztecs and was used widely in the Middle Ages. The famous scarlet tunics worn by the English during the Napoleonic wars owed their colour to carmine. To-day it is almost entirely replaced by aniline dyes.

Cockatoo a member of the parrot family bearing a crest of feathers on the head native to Australia and adjacent regions. Predominant colour is white tinged with yellow or scarlet while some species have dark plumage. The great black cockatoo of New Guinea is slaty black with pale red cheeks and can crack Kanary nuts which usually require a hammer to break them open.

Cockchafer (Melolontha) one of the most destructive of beetles, the larvae feeding on roots. It is about 1 inch in length of a brownish colour and emits a loud whirring sound when flying.

Cockle, the popular name of the bivalve shell fish of the genus *Cardium* found plentifully in sandy bays near low water line there are numerous British species.

Cockroach, inaccurately called the black beetle, a pest of bakeries and kitchens. In Britain two species are commonly found, the Common Cockroach (*Blattella orientalis*) resident since the time of Elizabeth I. dark brown, about an inch long with the wing covers long in the male and short in the female and the German Cockroach (*Blattella germanica*) now the most common half the size dark yellow with both sexes fully winged. All species have long antennae and flattened leathery shiny bodies. They are nocturnal and omnivorous.

Cocoa See Cacao

Coconut Palm (Cocos nucifera), a tropical tree, growing to a height of 100 ft. with a slender leaning trunk surrounded by giant feather-like leaves. One of the most important sources of food and raw material for people living in the tropics. The juice of the fruit or coconut is

drunk, the kernel is eaten fresh or dried to form copra which yields animal feeding stuffs and oil, used in the manufacture of soap, margarine, cosmetics, synthetic rubber, etc. Leaves are used for thatching, leaf stalks for canes, fences, needles etc. and the trunk for houses and bridges. Main producing areas: India, Ceylon, the Malay Peninsula, Ceylon and S. India.

Codes a term used to designate a system of law properly classified. The Code of Hammurabi, king of Babylon c. 1700 B.C. had extensive influence over a long period. The Romans formulated several codes of law of importance including the Theodosian Code which remained in force from 426 to the time of Constantine in 438 A.D. The final codification was made under order of the Emperor Justinian by his chief minister Tribonian and published in 529 with a new edition in 534. The most important of modern codes is the *Code Napoleon* compiled between 1803 and 1810 and in force. It has been used as an example for the codification of the laws of a number of countries from America to Japan. In 1927 Frederick the Great the law of Prussia was codified. Finally law has never been codified with the British system which has been with it up to the present. The Law Commission Act 1965 was passed to consolidate and collate the law wherever possible. See D28.

Codex manuscript volume of the Scriptures comprising the Smalick codex of the 4th cent., the Vatican codex of the same period, the Alexandrine codex of the 5th cent. and other. The British Museum in 1931 purchased the *Codex Sinaiticus* from the Soviet Government for £100,000.

Coffee a shrub found originally in Arabia and Abyssinia but now extensively grown in the West Indies, Brazil, India and Central America. It yields a seed or berry which after undergoing the necessary preparation is ground and largely used in most countries as a popular breakfast beverage. The best coffee is the Mocha an Arabian variety. The stimulating effect of coffee is due to the caffeine which also present in tea. The beverage was introduced into Europe in the 16th cent. and the first London coffee shop was opened in 1652.

Coke is the solid residue remaining when coal is carbonised and nearly all the volatile constituents have been driven off. Used as fuel and as an agent for reducing metallic oxides to metals e.g. iron ore to iron in the manufacture of steel.

Colorado Beetle a serious pest of potato crops. Both adults and larvae feed on the foliage. Both the orange eggs and the grubs are reddish with two rows of small black spots on each side. The adults are about 4 mm long with yellow and black striped wing cases. The beetle is avoided by birds because of its taste and is controlled by arsenical sprays.

Colosseum the name of the Flavian amphitheatre at Rome begun by Vespasian and finished by Titus A.D. 80. In general outline it still remains one of the most magnificent ruins in the world. In the arena of this great building the famous gladiatorial displays and mimic naval battles used to be given and about 50,000 spectators could be accommodated.

Colossus is the name which the ancients gave to any statue of gigantic size. The Colossus of Rhodes, which was a bronze statue of the sun god Helios, was the most famous, and reckoned among the seven wonders of the world. It stood over 100 ft. high at the mouth of the harbour. There is no truth in the legend that ships could pass between its legs. It fell in an earthquake in 224 B.C.

Colugo, also known as "flying lemur" a squirrel-like animal, a remarkable mammal which may be regarded as an aberrant insectivore or an aberrant form of the earliest ancestor of the bats. It has nothing to do with lemur. There are two genera, one inhabiting the Philippines and one inhabiting Malaya. They have a parachute-like membrane which covers them from the neck to the tip of the tail, by means of which they can glide from treetop to ground a distance of up to 70 yards.

Column, in architecture, is an upright solid body serving as a support or decoration to a building.

Columns consist of a pedestal a shaft and a capital over which the supported entablature rises. They are named according to the style of architecture of which they form part, being Doric, Tuscan, Ionic, Corinthian or Composite as the case may be.

Comets are celestial bodies which move about the solar system in elliptical or hyperbolic orbits. Usually these star like bodies are accompanied by a long shining tail. The hyperbolic comets are seen once only and do not reappear. The elliptical comets are periodic and their recurrence can be calculated with accuracy. The head of a comet is believed to consist of small lumps of solid matter accompanied by dust particles and gases such as carbon dioxide and methane. It is used to be thought that the tail was produced by the pressure of sunlight on the cometary material but a modern explanation is that it is produced by the combined action of the solar wind (a continuous stream of ionised hydrogen originating in the sun) and the interplanetary magnetic field. When they run parallel the effect is to produce a long streaming tail pointing away from the sun. Chief among the periodic comets is Edmund Halley's, the first to return as predicted in 1757 and it appears about every 76 years and is next due in 1985. The most spectacular comet of the 19th cent. was that found by Donati in 1858.

Common Law See D7

Commons are the remnants of the mediaeval open fields round villages in which the villagers had rights in common e.g. (i) estover—the right of taking wood for house building or firewood (ii) pasture—the right of grazing beasts (iii) tithary—the right of digging turf (iv) piscary—the right to fish. Many of these common lands were enclosed during the agrarian revolution which went on steadily in England from the 15th cent onwards and with their enclosure common rights vanished. A Royal Commission on Common Land described the commons in 1963 as the last reservoir of uncommitted land which provide as far as the public is concerned by far the largest part of the accessible open spaces of the country. Under the Commons Registration Act 1965 it was the duty of County Councils and County Borough Councils to make a register of all common land and all town and village greens in their areas.

Commons, House of the Lower House of the British Parliament See Section C Part II

Commune of Paris has twice played a dramatic part in the history of France. In 1792 it was able through its control of the administrative organisation of Paris, to override the National Assembly. In 1871, after the withdrawal of the Prussian troops it tried to assert its authority. Public buildings were destroyed by members of the Commune and civil war raged during April and half May but Government troops suppressed the rising.

Communism See J12

Compass or Mariner's Compass is an instrument by which the magnetic meridian is indicated and comprises a horizontal bowl containing alcohol and water, a card upon which the thirty two points of the compass are marked and the steel needle which always points to the meridian. Although the discovery of the directive property of a magnet is credited to the Chinese, the first practical use of this property in a compass was made in western Europe in the 12th cent. Aircraft and ships now largely employ gyrostatic compasses which are not affected by electrical and magnetic disturbances. Sperry, Brown and Anschütz are three important types of gyroscopic compass.

Computer, a technical device for accepting an input of information, processing this information according to some prescribed programme of operations and supplying an output of processed information. Many types of operation can be performed on many types of information and computers are now indispensable in science, business, warfare, government and other activities. Early thinkers in this field were Pascal (17th cent.), Babbage (19th cent.) and Turing (1930s) but electronic computers as we know them appeared during the Second World War and the first commercial machine was on sale in 1950. Computers are millions of times faster

than human beings at computing and the introduction of computers into an organisation does more than just speed up the calculations; it tends to transform the whole nature of the organisation. The possibilities for future developments seem enormous. Analogue computers and digital computers are two different kinds stemming from the difference between measuring and counting. Analogue types handle data that is represented by physical quantities of continuously variable size such as voltages or lengths. These quantities can be made to vary like the quantities in a problem which the computer is set to solve. The problem is thus solved by analogy. A slide rule is a rudimentary analogue computer in which numbers are represented by lengths of rule. Digital computers handle actual numbers expressed in digits and the quantities in the problem are represented by discrete numbers. These can all be expressed in binary form and thus stored or handled in bits. See Bit Binary Notation.

Conclave an assembly of Roman Catholic cardinals met together to elect a pope. The last Conclave was held in the Vatican in June 1963 when Cardinal Montini, archbishop of Milan was elected Pope Paul VI.

Concordat an agreement or convention between the pope and a secular government regarding ecclesiastical matters. The Concordat of Worms in 1122 between Calixtus II and the Emperor Henry V was famous as deciding a long struggle in regard to investiture. In 1801 Napoleon concluded a concordat with Pius VII defining the restored relations between the head of the Church and the French Roman Catholics.

Condor a large eagle of brilliant black plumage with a crest of white feathers round its neck. It is a native of the Andes.

Confederation is a free association of sovereign states united for some common purpose. It is to be distinguished from a Federation which is a union of states with one central government, each state relinquishing its sovereignty though retaining some independence in internal affairs.

Coniferae See J12

Coniferae are cone bearing trees including firs, pines, cedars, cypresses, junipers, yews etc. and are widely distributed in temperate regions.

Conservatism See J12

Consistory a council or meeting of councillors also the higher ecclesiastical courts and senates of the Anglican and Roman Churches.

Constitution, the fundamental organic law or principles of government of a nation, state, society or other organised body embodied in written documents or implied in the institutions and customs of the country or society. The government of the U.S.A. unlike Great Britain, works upon a written Constitution. It was framed when the U.S.A. came into existence as a sovereign body when the Constitution built a republic out of a federation of thirteen states based on representative government. The constitution was adopted in 1789 and its strength has been tested by the fact that substantially unchanged it is now the groundwork for a federation which now comprises fifty states.

Continent, a word used in physical geography to denote the larger continuous land masses in contrast to the great oceans of the earth. They are Eurasia (conventionally regarded as 2 continents Europe and Asia), Africa, North America, South America, Australia and Antarctica.

Continental Drift The hypothesis of drifting continents is due to F. B. Taylor, an American geologist who published his theory in 1908 and to the Austrian meteorologist Alfred Wegener in 1910. The latter was impressed by the matching coasts of South America and Africa, which seemed to him to fit together like the pieces of a jigsaw puzzle. Since then many other people have taken up and developed the idea. According to Wegener at one time there were two primary super-continents, Laurasia and Gondwanaland. The one in the northern hemisphere consisted of North America, Europe and the northern part of Asia. Its southern counterpart included Antarctica, Australia, India, Africa and South America. These super continents broke up, and their various bits moved apart. In particular the southern hemisphere continents drifted radially north.

- wards away from the south pole and the two Americas shifted westwards from Europe and Africa. What would have been the leading edges of the land masses on this hypothesis are now heavily buckled up into mountain belts such as the Cordillera and the Alpine Himalayan chain. The resistance afforded to drifting by the strong ocean floor may well have been the cause of such structures. Despite the wealth of geological facts which have a bearing on the problem of continental drift none of these has been able to decide the issue in a conclusive manner. Further studies of rock magnetism (*q.v.*) and of fossil climates should ultimately establish the concept of continental drift on a firm basis. See also Earth F8
- Conurbation** a term which has been defined as an area occupied by a continuous series of dwellings factories and other buildings harbours and docks urban parks and playing fields etc. which are not separated from each other by rural land though in many cases in this country such an urban area includes enclaves of rural land which is still in agricultural occupation. The term has been widely adopted for the contiguous densely populated areas which form continuous urban areas. The seven officially recognised in Britain are Greater London West Midlands S.E. Lancashire West Yorkshire Merseyside Tyne and Wear
- Convention** is an assembly of delegates representing members of a party met to accomplish some specific civil social political ecclesiastical or other important object
- Convocation** an assembly called together to deliberate ecclesiastical affairs. In the Church of England the province of Canterbury and York each have their convocation. The term is also applied to assemblies of the graduates of certain universities.
- Coot** A very widely distributed bird of the rail family and a common resident of the British Isles. The adult is black with a conspicuous white bald shield on the forehead and a white bill. The juvenile is brownish grey with whitish breast and throat. The coot flies heavily but swims well. It dives frequently and can remain submerged for a considerable time. It is pugnacious and in winter gregarious. The food is chiefly vegetable. The large nest is usually built among aquatic vegetation and the young are fed by both parents. Another species the Crested Coot occurs in S. Europe
- Copper** one of the most familiar of metals, symbol Cu used in ancient times as an alloy with tin in producing bronze, and preceding iron as an industrial material. Copper ores are most abundant in the U.S.A. Chile Canada Zambia and the Congo. All copper compounds are poisonous. Copper sulphate is largely used in calico printing and in the production of blue and green pigments
- Copyright** Under the Copyright Act 1956 copyright subsists in every original literary dramatic musical and artistic work if the author is a British subject or a citizen of the Republic of Ireland or resident in the United Kingdom, or if the work is first published in the United Kingdom. The Act provides that except in certain special cases, the author of the work shall be the first owner of the copyright and there are no formalities, such as registration or payment of fees, to be accomplished. Copyright includes the right to reproduce the work in any material form, to perform the work in public, or if the work is unpublished, to publish the work. The Act also protects sound recordings, films, and television and sound broadcasts. Literary dramatic, musical, and artistic works which enjoy the protection of the Act are automatically protected in those countries which are parties to the Berne Copyright Convention or the Universal Copyright Convention. In general copyright in literary, dramatic, musical, and artistic works is vested in the author for the period of his lifetime and 50 years following after which it passes into the public domain and becomes freely available to any who wish to make use of it. The Copyright Libraries, entitled to receive copies of books published in the United Kingdom are given under Libraries. A new copyright convention was signed in Stockholm in 1967 which gives under development countries the right to reproduce without payment if they choose any books to be used for their teaching or research. The Government Department responsible for matters in connection with copyright is the Industrial Property Department, Board of Trade, 20 Southampton Buildings, London W.C.2
- Coral** an order of marine animals closely related to the sea anemones but differing from them in their ability to develop a very hard skeleton. They multiply sexually and by budding. The structure of the coral secretory assumes a variety of forms (table tree like mushroom shape and a variety of other shapes). *Corallium rubrum* is a mainly obtained from the Mediterranean. The coral reef of the Pacific and Indian Oceans are often many miles in extent. Live corals occur only in warm seas at about 23°C. See also Gt. Barrier Reef K69
- Cordite** a smokeless explosive adopted for small arms and heavy artillery by the British Government in the naval and military services in 1894 and composed of 4 parts of nitro glycerine 7 of nitro cotton and 3 of vasoline. It is a jelly like pasta dough and used in the form of sticks.
- Cork** the bark of a species of oak *Quercus suber* grown largely in the South of France and North America. The cork tree is cut every 10 years and the bark is stripped off every 10 years. It is a light brown colour and is 1/4 to 1/2 inch thick. It is used for a variety of purposes especially for stoppers of bottles.
- Cormorant** a large long-billed water bird which captures fish by diving. It has brown black plumage with white cheeks and a black band around the sea coasts of most parts of the world including the British Isles. It nests in colonies on sea cliffs and rocky ledges. The Shag or Green Cormorant is a smaller bird with green black plumage and a crest.
- Cornflake** See Landrail.
- Corn Laws** were statutes intended for the benefit of British agriculture and restricted import and export of grain. From the 14th to the mid 19th cent. such laws were in force and were of a stringent nature. They became so oppressive and caused corn to reach so high a price that the poorer classes were plunged into distress. A powerful anti corn law agitation was organised, of which Cobden Bright and Villiers were the leaders, and Sir Robert Peel in 1846 at the time of the Irish potato famine carried through free trade. The repeal of the Corn Laws marked an important phase in the transformation of an agricultural to an industrial Britain.
- Coronae** series of luminous rings surrounding sun or moon produced by the diffraction of light by water droplets in the atmosphere. Usually seen when sun shines through altostratus clouds. The outside of the ring is red and the inside bluish. See Halo
- Corpus Christi Festival** is one of the great celebrations of the Roman Catholic Church and takes place on the Thursday after Trinity. It was instituted by Pope Urban IV in 1264.
- Cortes** the name of the Parliamentary assemblies of Spain and Portugal.
- Cosmic Rays** a form of radiation coming from outer space, of deep penetrating power and of great scientific interest. The rays are believed to consist chiefly of fast protons with a few α particles and other positive nuclei. By interacting with the gas of the atmosphere these rays initiate a complex series of events, in the course of which other particles (secondary radiations) are generated. The secondary rays contain virtually all the particles listed on F14. Indeed several particles were first discovered as secondary cosmic rays. Cosmic rays are investigated at and below sea level on mountains, in mines in balloons, rockets and satellites. Origin still uncertain. See F8(3)
- Cosmology** is the science which studies the whole universe its origin, its nature, its size and evolution. At present it is a very active science partly because new techniques such as radio-astronomy are revealing more facts about distant parts of the universe and partly because of fruitful clashes between theoretical ideas. See F8-7
- Cotton**, the name of a plant of several species

bearing large yellow flowers with purple centres. These centres expand into pods which at maturity burst and yield the white fibrous substance known as cotton. The raw cotton contains a large proportion of seeds which are removed by ginning. Long before the Christian era cotton had been grown and used with great skill in India to make fabrics. The industry was not introduced into Europe until the middle of the 17th cent. when Protestant refugees from Flanders came to settle in the wool textile districts of East Anglia and Lancashire. With improvements in machinery and expansion of overseas trade in the 18th and 19th cent. Lancashire became the centre of the world's cotton industry. Since the second world war man-made fibres have taken the place of cotton. Cotton reacts with nitric acid to form gun cotton which is combined with more sensitive explosives to give a more safely handled substance.

Coulomb a unit of electric charge named after the French naval engineer Charles Augustin de Coulomb (1736-1806) equal to the quantity of electricity transferred in one second by a current of one ampere.

County The word county was introduced after the Norman conquest as an equivalent of the old English shire. England has 41 geographical counties, Wales 13, Scotland 33 and Ireland 32. The number of administrative counties differs from the number of geographical counties because the division for Local Government purposes is made on grounds of convenience. Under the London Government Act 1963 the county of Middlesex was absorbed in Greater London.

Coup d'Etat a violent change in the government of a state carried out by force or illegally. Examples are the overthrow of the French Republic in 1851 by Louis Napoleon, who then became Emperor, and more recently the military coups in the Middle East which brought about the abdication of Farouk of Egypt in 1952 and the assassination of Faisal of Iraq in 1958.

Court Leet a court of record held annually before the steward of any particular manor or lordship. Originally there was only one court for a manor but in the time of Edward I it branched into two the court baron and the court leet.

Coyote or Nutria rat, a large beaver-like rodent found in S. America, now wild in E. Anglia, where it is causing damage to dykes, reeds and crops, having escaped from farms where it is bred for its fur.

Crane a large graceful wading bird with elegant long legs and neck, greyish plumage superficially resembling the heron and related to the bustard. They migrate in V or W formation and have trumpet-like voices. There are several species found in all continents except S. America, including the Crowned Crane with golden coronet and the Demoiselle with tuft-like crest of white feathers. The Common Crane nested in East Anglia in mediaeval times but now comes only as a rare visitor from the Continent.

Credit is an advance of money or of goods or services in consideration of a promise of payment later. Trade credit is such an advance from trader to customer. Bank credit is an advance of money by a bank to a client, whether a business firm or a private person, in consideration of an interest payment by the borrower.

Creed, (Latin *credo* = I believe) a formal statement of belief. The three orthodox Christian creeds are the Apostles' Creed (a summary of their teaching), the Nicene Creed (drawn up by the Church Council at Nicea in A.D. 325 to define its theological doctrines), and the Athanasian Creed (concerning the nature and divinity of Christ). See also under individual headings.

Cremation, the ancient custom revived in modern times, of burning the dead. Cremation was first legalised in Great Britain in 1855 and the first crematorium opened at Woking in that year. Application for cremation must be accompanied by two medical certificates.

Cricket, a genus of insects of the grasshopper order which move by leaps. The male produces a chirping noise by rubbing its wing-covers to gether.

Crimean War (1853-56) This war between Russia

and the allied powers of Turkey, England, France and Sardinia, was connected with the Eastern Question (q.v.) and the desire of Russia for a port on the Mediterranean. Chief engagements were the Alma, Balaklava and Inkerman. Fighting virtually ceased with fall of Sevastopol in Sept. 1855. Treaty of Paris signed March 30, 1856.

Crocodile the name of the largest existing reptile and classed with the alligator and the gavia. The crocodile inhabits the Nile region, the alligator the lower Mississippi and the gavia is found in many Indian rivers.

Crow a family of birds including many well known species such as the rook, raven, jackdaw, carrion crow, hooded crow, magpie, nutcracker, jay and chough.

Crusade were military expeditions undertaken by some of the Christian nations of Europe with the object of ensuring the safety of pilgrims visiting the Holy Sepulchre and to retain in Christian hands the Holy Places. For two centuries nine crusades were undertaken. First 1096-99 under Godfrey of Bouillon which succeeded in capturing Jerusalem. Second 1147-49 led by Louis VII of France a dismal failure which ended with the fall of Jerusalem. Third 1189-92 in which Richard I of England took part making a truce with Saladin. Fourth 1202-4 led by French and Flemish nobles a shameful expedition resulting in the founding of a Latin empire in Constantinople. Fifth 1217-21 led by John of Brienne. Sixth 1228-29 under the Emperor Frederick II. Seventh 1248-54 under St. Louis of France. Eighth 1270 under the same leadership but cut short by his death on an ill-judged expedition to Tunis. Ninth 1271-72 led by Prince Edward of England which accomplished nothing. Millions of lives and an enormous amount of treasure were sacrificed in these enterprises and Jerusalem remained in the possession of the infidels. The chief material beneficiaries were the Italian maritime cities, the chief spiritual beneficiary was the pope but in literature and the arts both Europe and the Levant benefited enormously from the bringing together of the different cultures.

Cryogenics (Greek roots: productive of cold) is the science dealing with the production of very low temperatures and the study of their physical and technological consequences. Very low is often taken to mean below about -150°C . The growth of cryogenics (essentially a 20th cent. science) is connected with the discovery of how to liquefy all gases including even helium which resisted liquefaction until 1908. Scientifically cryogenics is important partly because special phenomena (e.g. superconductivity (q.v.)) appear at low temperatures and partly because more can be learned about ordinary properties by studying them in the absence of heat. Technologically cryogenics is becoming more and more significant for example liquefied gases are rocket propellants, superconductors make valuable magnets, tissue-freezing techniques (using very cold liquids) have been introduced into surgery. See Absolute Temperature.

Crystal in everyday usage a solid chemical substance bounded by plane surfaces which show a regular geometrical arrangement as e.g. quartz crystals, rock salt, snow flakes. In physics the term means any solid whose atoms are arranged in a regular three-dimensional array. This includes most solids even those not particularly crystalline in appearance, e.g. a lump of lead. Common non-crystalline substances are liquids, jellies, glass.

Cubism, the name of a revolutionary movement in art created in the years 1907-9 by the two painters Picasso and Braque. Rejecting purely visual effects they approached nature from an intellectual point of view, reducing it to mathematical orderliness. Its respectable grand parent was Cézanne who had once written 'you must see in nature the cylinder, the sphere, and the cone—a concept which, together with the contemporary interest in Negro sculpture, moved the two founders of the movement to experiment with the reduction of natural forms to their basic geometrical shapes. In practice, this meant combining several views

of the object all more or less superimposed in order to express the idea of the object rather than any one view of it. The name Cubism was derivative and the movement aroused the same opposition as Impressionism, Fauvism and the later Futurism. Picasso's *Young Ladies of Algeria* was the first Cubist painting and his *Head* (1909) the first Cubist sculpture. Three phases are recognised: (1) Cubism under the influence of Cézanne; (2) high or analytical Cubism (c. 1909-12) concentrating on the breaking down of form to the exclusion of interest in colour; (3) synthetic Cubism (c. 1913) making use of collage in which pieces of pasted-on paper (illustrations, wallpaper, newspaper) and other materials were used in addition to paint. Amongst other early cubist painters were Metzinger, Gleizes, Gris and Leger.

Cuckoo, a well known migratory bird which is found in Great Britain from April to July, hawk like in shape with a very characteristic note uttered during the mating season only by the male. The hen has a soft bubbling call. It lays its eggs in the nests of other birds, e.g. the meadow pipit and hedge sparrow, but only one egg in each nest. Feeds mainly on insect, particularly hairy caterpillars.

Cuneiform, (Latin = *wedge-shaped*) an ancient method of writing by impressing wedge like strokes into tablets of damp clay which when dried and hardened formed a permanent script. Cuneiform writing developed from its original pictographic form into a phonetic writing and can be traced back to the non-Semitic Sumerians of ancient Mesopotamia, the earliest civilisation known to us. It passed to the Semitic Babylonians of Babylon in the 3rd millennium B.C. who adapted it to their own language. Decipherment by Sir Henry Rawlinson, 1835.

Curfew (Old Fr. *coeur feu* = cover fire) a regulation common throughout Europe in medieval times by which at a fixed hour in the evening the church bell was rung as a signal that fires were to be put out and the people were to go to bed. The custom originated in the fear of fire when buildings were built of timber. Now days a curfew is imposed by the military in areas where riots or disturbances are expected, compelling the civilian population to remain in doors after nightfall.

Curia, the central government of the Roman Catholic Church. By the reform which came into force on Jan 1 1968 its twelve Sacred Congregations or ministries were reorganised and reduced to nine. The aim of the reform was to streamline the Curial offices so that the Church's machinery can cope with modern problems, so favouring the desires expressed by the Ecumenical Council convened by Pope John.

Curie, a measure of the rate at which radioactive material emits radiation. One curie is a disintegration rate of 3.7×10^{10} disintegrations per second.

Curlew, a wading bird of which there are several species. It frequents marshy places, feeds on worms, insects, molluscs, and berries and possesses a very long down-curved bill.

Currency is the name given to the types of cash money—metal or paper—in use in an area (e.g. pound, sterling, dollar, franc). It also designates the actual coins or notes issued. Its amount is usually subject to regulation by the Government or by a Central Bank acting on the Government's behalf. Britain changed over to a £ based decimal currency in Feb 1971. See also Foreign Currencies N9.

Cybernetics, the science concerned with the automatic control and communication processes in both animals and machines. Thus it is concerned with brain function, information theory, electronic computers, and automation.

Cyclone, a term usually applied to tropical revolving storm. Cyclones often occur towards the end of the hot seasons and are mainly confined to tracks in the western areas of the oceans, being known as hurricanes (Caribbean and Pacific), cyclones (Indian Ocean) and typhoons (China Seas). The circulation of air in a cyclone is similar to that in the depression of temperate latitudes, but the region of low pressure is much more localised and the pressure gradients steeper. Winds of hurricane strength and torrential rain occur generally, although at the centre of the

storm there is a small area known as the 'eye,' where fair calm weather prevails.

Cyclotron, a machine for accelerating charged particles such as protons to very high energies. Devised by E. O. Lawrence in California in 1930 it uses a magnetic field to make the particles traverse nearly circular paths and an electric field to give them an additional pulse of energy each time round. The accelerated particles impinge on targets, and the resulting events are a basic source of information for nuclear physicists. The cyclotron is obsolete and has led to the development of other machines e.g. betatrons, synchrotrons. Britain has two major natural high energy accelerators: Nimrod (7000 MeV proton synchrotron) and Amd (4000 MeV) electron accelerator.

D

Dactylopterus, a fish of the gurnard family with wing like pectoral fins sometimes known as the flying fish though that appellation is more generally given to *Exocoetidae*.

Dadaism (French *Dada* = hobby-horse) was a hysterical and nihilistic precursor of Surrealism (q.v.) resulting from the shock produced by the first world war. Beginning in Zurich about 1915 it spread to other continental cities such as Berlin and Paris dying out in 1922. The movement was deliberately anti-art, destructive and without meaning. It intended to scandalise by such tricks as compositions made out of anything that came to hand—buttons, bus tickets, pieces of wire bits of tin etc. Other excesses included incoherent poetry, Dada night-clubs, plays and short lived newspapers. Many Dadaist painters became Surrealists at a later stage but where Surrealism is a deliberate attempt to present subconscious and dream like images Dadaism was sheer anarchy. Among its chief exponents were Hans Arp, Marcel Duchamp, André Breton, Guillaume Apollinaire and Max Ernst, all of whom subsequently became noted in more reputable ways.

Daddy Longlegs, or Crane-fly, a slender long legged fly of the family Tipulidae. The larvae which do damage to lawns and plants are called leather jackets. The Americans call Harvestmen (q.v.) daddy longlegs.

Daguerreotype, a first practical photographic process, invented in Paris by M. Nicéphore during the years 1824-33. The light-sensitive plate was prepared by bringing iodine in contact with a plate of silver. After exposure a positive image came by development of the plate in mercury vapour. Even for open-air scenes the first daguerreotypes involved exposure of 5-10 minutes. The wet collodion process (1851) rendered the technique obsolete.

Dail Éireann, the name of the national parliament of the Irish Republic.

Damaskeening, the art of inlaying one metal upon another largely practised in the East in medieval times, especially in the decoration of sword blades.

Dandies, the name given to a class of exquisite prominent in early Victorian days, and who attracted attention by excessive regard for dress. Their feminine counterparts were the dandizettes.

Danegeld, a tax imposed in England in Anglo-Saxon times to raise funds for resisting the Danes or to buy them off. Edward the Confessor abolished the tax, but it was revived by the Conqueror and subsequently retained under another name, after the danelaw from the Danes was past. It is the basis of all taxation in this country. Domesday Book (q.v.) was originally drawn up for the purpose of teaching the State how to levy the tax.

Danelaw, the law enforced by the Danes in the kingdoms of Northumbria, East Anglia, and in the districts of the five (Danish) boroughs—lands grouped round Leicester, Nottingham, Derby, Stamford, and Lincoln—which they occupied during the Viking invasions of the 8th and 10th cent. The country occupied was also called the Danelaw or Daneland.

Darter, 1. Snakebirds, a genus of the pelican family with long, pointed bill and serpent-like neck and

resembling cormorants in appearance. There are 3 species. Numerous species of small freshwater fish belong to the Perch family found in N. America.

Date Palm *Phoenix dactylopera* one of the oldest known food plants widely cultivated in N. Africa and W. Asia. It grows to 100 ft and continues to bear for 2 or 3 centuries. Its fruit being of great value as a food. From the leaves the Africans make roofs for their huts. Ropes are made from the fibrous parts of the stalks and the sap furnishes a stimulating beverage.

Dauphin the title borne by the eldest sons of the Kings of France from 1340 to the Revolution of 1890.

Day is the most natural unit of time and may be defined as the period of rotation of the earth relative to any selected heavenly body. Relative to the sun it is called the *solar day*. Relative to a fixed star it is called the *sidereal day*. Owing to irregularities in the earth's movements the time taken for the earth to rotate through 360° relative to the sun is variable and so the *mean solar day* of 24 hours has been introduced which is the average throughout the year. The *mean solar day* is our standard used for purposes of the calendar and astronomers use *sidereal* clocks to check mean solar time. In practice for convenience the *sidereal day* is determined by the earth's rotation relative to the vernal equinox or first point of Aries and is equal to 23 hours 56 minutes and 4.091 seconds of mean solar time (i.e. about 4 minutes shorter than a solar day). See **Time**.

DDT (dichloro diphenyl trichloroethane). A very powerful insecticide which has had wide success in the control of diseases such as malaria and typhus which is carried by insects. Mosquito swamps are sprayed with DDT to kill the carriers. Because this toxic chemical breaks down very slowly it builds up in birds and animals and its use is now banned in Britain. Its detection in Antarctic wild life confirmed that DDT pollution was virtually world wide.

Deacon an ecclesiastical official who assists in some of the smaller ministerial duties in church or chapel. In the Anglican Church he ranks below a priest.

Dead Languages are such as the ancient Greek and Roman tongues which are no longer spoken but are preserved in literature.

Dead Sea Scrolls a group of ancient Jewish documents, consisting of scrolls and fragments which have been recovered since 1947 in the vicinity of Qumran near the Dead Sea and which represent one of the most important finds ever made in the field of biblical archaeology and Christian origins. The scrolls written in Hebrew or Aramaic were found in caves the first by chance by an Arab shepherd in 1947. These consisted of biblical texts older by a thousand years than the earliest Hebrew manuscript of the Old Testament (A.D. 395). Many fragments have since been discovered comprising the whole of the Old Testament with the exception of Esther. In addition there are commentaries and other non-biblical writings including one called *The War of the Sons of Light with the Sons of Darkness*. The writing on the scrolls indicates that they were written over a period of two centuries, the greater proportion before the birth of Christ. A nearby ruin is believed to have been the home of a religious sect called the Essenes (I.T.) to whom the scrolls belonged. By the aid of the latest scientific techniques including radiocarbon tests the age of the scrolls is being accurately determined. An account of the scrolls and their implications is given in Edmund Wilson's *The Dead Sea Scrolls, 1947-1969*.

Dean, a Church of England dignitary ranking below a bishop and the head of the chapter of a cathedral. A rural Dean supervises a *deanery* or group of parishes. There are also Deans of Faculties in some universities, and at Oxford and Cambridge the *Dean* is in charge of chapel services and disciplinary arrangements.

Death Watch Beetle (*Xestobium rufovillosum*) a wood-boring beetle, larger than the common furniture beetle found chiefly in the old oak beams of churches and other historic buildings. The grub bores from 4-12 years. The name "death watch" comes from the superstition

that the ticking sound made by the beetle striking its head against the wood is a sign of approaching death. The death watch beetle in the roof of Westminster Hall is being smoked out by means of an insecticide called gamma benzene hexachloride. See also **Furniture Beetle**, **Woodworm**.

Decalogue name given to the Ten Commandments of the Old Testament. There are two versions of them differing in detail. Exodus xx 2-17 and Deuteronomy v 6-21. They are of Hebrew origin and are recognised by Jews and Christians as the divine law given by God to Moses on Mt. Sinai. Most of them are prohibitions in contrast to the beatitudes (pronounced by Christ in the Sermon on the Mount) which are positive. Blessed are the merciful.

December the last month of the year in our calendar and the tenth in the old Roman.

Deciduous Trees are such as shed their leaves at certain seasons as distinguished from evergreens or permanent foliaged trees or shrubs.

Decimal System is based on the unit of 10. **Duodecimal System** is based on the unit of 12. Fractional numbers are expressed as divisions of 10 and 12 respectively. Thus

Fraction	Decimal	Duodecimal
$\frac{1}{2}$	0.5	0.6
$\frac{1}{3}$	0.3333	0.4
$\frac{1}{4}$	0.25	0.3
$\frac{1}{5}$	0.2	0.2497
$\frac{1}{6}$	0.1666	0.2
$\frac{1}{7}$	0.125	0.16
$\frac{1}{8}$	0.0833	0.1
$\frac{1}{9}$	0.04166	0.06

Decimal currency was imposed on France in 1795. The United Kingdom changed over to decimal currency on 15 February 1971. The six new coins are

Denomination	Value	Metal
$\frac{1}{4}$ new penny	1.2d	bronze
1 new penny	2.4d	bronze
2 new pence	4.8d	bronze
5 new pence	1s	cupro nickel
10 new pence	2s	cupro nickel
50 new pence	10s	cupro nickel

Declaration of Independence was an Act by which the American Congress on July 4 1776 declared the American colonies to be independent of Great Britain. Independence Day is a holiday in the United States.

Defender of the Faith (*Defensor Fidei*) a title conferred upon Henry VIII by Pope Leo X. in 1521 for entering the lists against Luther with his book on *The Assertion of the Seven Sacraments*. In 1554 the title was confirmed by Parliament and has been used ever since by English sovereigns.

Deflation is a policy designed to bring down costs by reducing the supply of means of payment. It is usually advocated as a remedy for inflation and in this connection is often referred to as Disinflation. It usually results in a fall in employment. The credit squeezes of the 1950s in Great Britain were designed to have a disinflationary effect.

Dehydrate to eliminate the water from a substance. The process of dehydration is now used in the food industry as a result of wartime research in making such things as dried egg and packet soups. Most vegetables contain over 90% of water and much of this can be removed under vacuum at low temperatures without appreciably impairing the flavour. The lightness of the dehydrated products is an advantage when supplies have to be transported.

Deliquescence, the process of dissolving by the absorption of moisture from the atmosphere. For instance chromic acid crystals on exposure to the air quickly deliquesce.

Delta a triangular tract of land between diverging branches of a river at its mouth, and so called from its general resemblance to the Greek letter Δ , *delta*. The best-known examples are the deltas of the Nile, the Ganges, the Niger and the Mississippi.

Deluge, a flood, commonly applied to the story of the Deluge in the Bible, in which Noah and the Ark figure. A similar tradition lingers in the mythologies of all ancient peoples.

Democratic Party one of the two great American political parties originated about 1787 advocating restrictions on the federal governments and in opposition to the federalists. It was in 1825 that a group who were in favour of high tariffs seceded later to become the Republican Party. The Democratic Party was split again over slavery before the Civil War (1861-65) and in the main the southern states have been supporters of the Democrats. The economic depression helped the Democrats to power in 1893 (see New Deal) and they held office until 1903 when Eisenhower became President. In 1900 Kennedy narrowly won the Presidency and in 1904 Lyndon Johnson swept in with a landslide victory over the Republican candidate. In 1964 Humphrey was beaten by Nixon the Republican candidate. The symbol of the party is a donkey invented like the Republican's elephant by the cartoonist Nash.

Demouelle, the Numidian crane a wading bird. Also a sub order of dragon flies which close their wings over their backs when at rest.

Dendrite a stone or mineral on or in which tree-like tracery appears the result of the action of the hydrous oxide of manganese.

Density a measure of the mass per unit volume of a material usually expressed in grams per cubic centimetre. *Specific gravity* is the ratio of the density of material at the temperature under consideration to that of water at the temperature of its maximum density (4°C). In grams per cubic centimetre the density of gold is 19.3 silver 10.5 lead 11.3 water 0.99997 and 0.00129.

Depreciation of a currency is a fall in its relative value in terms of gold or of other currencies. The term is most often used to indicate a fall in the value of one country's money in relation to others.

Depression a region where barometric pressure is lower than that of its surroundings. These areas of low pressure enclosed by the isobars are usually less extensive than anticyclones and may vary from 100 to 1 000 miles in diameter. The winds often of gale force when the depression is deep blow round the system in an anti-clockwise direction in the Northern Hemisphere (in the reverse direction in the Southern Hemisphere) and inwards across the isobars. The majority of depressions which cross the British Isles travel from the Atlantic sometimes in series or families, at rates of between a few miles and 700 miles in a day bringing their generally unsettled weather with them.

De Profundis (out of the depths) the first two words of the Latin version of the 130th Psalm, and commonly used to designate this psalm.

Deserts, vast barren, stone or sandy wastes where there is almost no rainfall and little or no vegetation. These regions are found in the interior of the continents Africa, Asia and America between 20° and 30° north and south of the equator. Europe is the only continent without deserts. The most famous are the Sahara, the largest in the world, the Gobi desert of central Asia, the Kalahari desert of south-west Africa, and the great Australian desert.

Detention Centres in Britain are for young people (boys and girls) over 14 but under 21 who have been found guilty of an offence for which an adult could be sent to prison. Controlled by the Home Office.

Determinism and Free-will. See Section J.

Deuterium or heavy hydrogen. The second isotope of hydrogen the third is called tritium. Deuterium atoms have in their nuclei a neutron as well as a proton. Tritium nuclei have two neutrons and one proton. In ordinary hydrogen gas about one out of every 5 000 atoms is a deuterium atom. Deuterium was discovered in 1932 by Professor Harold Urey. The oxide of deuterium corresponding to water is called heavy water. The nucleus of the deuterium atom is called a deuteron. An anti deuteron consisting of an anti-proton and an anti-neutron was produced at Brookhaven in 1965, the first compound anti-nucleus ever to be produced.

Devaluation is a definite, official downward valuation of a country's currency in terms of its exchange value with other currencies. The £ was devalued in 1949 when an official exchange rate of £1 = \$2.8 was established, and again in 1967 to a rate of £1 = \$2.4.

Devonian System in geology refers to the strata between the Silurian and the Carboniferous Formations. It includes the Old Red Sandstone Formation. The fauna of the Devonian include the group of fishes known as the Rhinidactyls from the evolutionary route towards the amphibians. *Actinoptera* (insects) and the *Diplocl* or lung fishes. See F44.

Dew moisture deposited by condensation of water vapour on exposed objects especially during calm, cloudless nights. The loss of heat from 'the ground after sunset' by radiation causes the layer of atmosphere close to the surface to be chilled below the temperature known as the dew point at which the air is saturated with vapour. Part of the vapour condensed may be transpired from blades of grass and foliage of plants.

Dew Pond is a shallow artificial pond which is on high ground and rarely dried up even during prolonged droughts despite being used by cattle and sheep as a drinking source. The name arose from the belief that dew deposits at night provided the moisture for the grass. Drainage of rain water and mist condensed on neighbouring trees and shrubs are probably more important factors.

Dialectical Materialism See J14.

Diamond a mineral form of the element carbon. It is the hardest known substance and is a gem and in industry. It is the 'fourth' country to mine diamonds the Koh-i-noor known since 1941 came from Guyana and Hyderabad. The celebrated diamond mines of South Africa were discovered in the 1870s. Other important diamond producing countries are Angola, Sierra Leone, Congo, Tanzania, Guyana, and the Soviet Union. Diamonds can be made artificially by subjecting carbon to very high temperatures and pressures. Many industrial diamonds are made this way. Antwerp is the main diamond centre of the world. London the main marketing centre. Amsterdam the main diamond cutting centre.

Diatoms. One-celled algae common in fresh and salt water. Distinctive feature is the siliceous wall which is in two halves, one fitting over the other like the lid of a box. These walls are often very finely and beautifully sculptured. The diatoms constitute a class of the plant kingdom known as the Bacillariophyta. *Diatom ooze* is a deep-sea deposit made up of diatom shells. *Diatomite* or *radiolarian ooze* is the mineral form that such diatom ooze assumes (sometimes known as kieselguhr which mixed with nitroglycerine yields dynamite).

Diatonic Scale. The ordinary major and minor scales on which most European music is built.

e.g.
C major C-D-E-F-G-A-B-C
Tone intervals 1-1-1-1-1-1-1-1
C minor C-D-Eb-F-G-Ab-Bb-C
Tone intervals 1-1-1-1-1-1-1-1

Dies Irae (the Day of Wrath) a famous 18th-century Latin hymn of the Roman Catholic Church, part of the Requiem Mass.

Diesel Engine. A compression ignition engine. The air in the cylinder is compressed to over 500 lb per sq. in. and its temperature is about 800° F. oil injected into the hot compressed air ignites immediately. The modern oil engine has been evolved mainly from the principles enunciated by Herbert Akroyd-Stuart in his patent of 1890 and like the steam and other inventions, represents the improvements achieved by many men, including those by Rudolf Diesel of Germany in respect of low compression pressures and greater fuel economy. Diet in German history an assembly of dignitaries or delegates called together to debate upon and decide important political or ecclesiastical questions. The most famous Imperial Diets were those held at Worms (1521) Speyer (1520) and Augsburg (1530) all of which dealt with matters of religious conflict arising from the Reformation.

Diffusion is the process of mixing which occurs when two liquids or gases are in contact. It is most rapid between gases, and, as laid down by Graham's law, 'the rates of diffusion of different gases are in the inverse proportion to the square roots of their relative densities.'

Diffusion arises through the continual movement of molecules. Even in solids diffusion can occur. If a block of gold and a block of silver are welded together after some time particles of gold are found in the silver and *vice versa*.

Dimensions in common speech are the magnitudes of length, breadth and thickness giving the size of an object, thus a line has only one dimension length, a plane surface two length and breadth and a solid three length breadth and thickness. In mathematics hypothetical objects with any number of dimensions are considered. In physics and mechanics dimensions are numbers which relate the units in which any quantity is measured to the called fundamental units. The latter are usually but not necessarily those of length, mass and time. Dimensional analysis is an important technique of scientific reasoning.

Dimorphism the quality of assuming two distinct forms. For instance carbon which is graphite in one form is the diamond in another.

Dinosaur the name given to a group of extinct reptiles of the Mesozoic period some of which were of immense size—much larger than crocodiles. See *Diplodocus*.

Diorite an igneous rock of crystalline structure composed of felspar and hornblende. It used to be classed as greenstone.

Dip Needle Instrument for measuring the dip or inclination of the earth's magnetic field.

Diplodocus, one of the best known of the extinct mammoth dinosaurs. Fossil remains have been discovered in the Jurassic rocks of the United States. Some reached a length of over 80 ft.

Dipnoi or Lung Fishes these have the air bladder adapted to function as a lung and they can remain alive when the stream or marsh in which they live dries up. Species of lung fish occur in Australia, Africa, and S America.

Diptera an order of insects. Their main characteristic is that they are two winged and the common house fly is the best known example. There are at least 50 000 species of these insects, including gnats, blow flies, mosquitoes, tsetse.

Diptych was a folding two leaved tablet of wood, ivory or metal with polished inner surfaces utilised for writing with the style by the ancient Greeks and Romans. The same term was applied to the tablets on which the names of the persons to be commemorated were inscribed in the early Church. In art any pair of pictures hinged together is styled a diptych.

Discus a circular piece of metal or stone about 12 in. in diameter used in athletic contests by the ancient Greeks and Romans. Throwing the discus was a very favourite game which was deemed worthy of celebration in Myron's famous *Discobolus* (c. 460 B.C. - 450 B.C.) the best copy of which is in Rome.

Disk, an astronomical term denoting the seemingly flat surface of celestial bodies as seen by the eye.

Distillation a process used to separate liquids of different boiling points. This is effected by placing the mixture in a distillation apparatus and heating. The liquid with the lower boiling point distils over first, the vapour being condensed and collected forming the first *fraction*. With continued heating the first *fraction* distils over and the mixture is said to be *fractionated*. Mixtures of liquids with close very high boiling points require more elaborate apparatus. Fractional distillation is a common process in the chemical industry particularly in the refining of petroleum.

DNA (Deoxyribonucleic acid) a polymer molecule in the form of a double strand helix containing many thousands of sub-units. Contains the genetic information coded in sequences of sub-units called bases. The Nobel Prize for medicine was awarded in 1962 for the discovery of the structure of DNA, that for 1968 for interpreting the genetic code and its function in protein synthesis. See *Nucleic Acids*, also L128.

Docks are enclosed water spaces where ships rest while being loaded or unloaded, repaired, or waiting for cargo. There are three main types: the wet dock in which water is maintained at the level of high tide so that vessels remain afloat while loading and unloading; the tidal

dock with open entrance to permit free ebb and flow of tide (e.g. Glasgow, Southampton (which has double tides)) and the dry dock or graving dock for overhauling and repairing vessels so constructed that after a ship has been docked the water can be drawn off (e.g. Southampton, Tilbury). The floating dock is a type of dry dock. The Port of London Authority operates four main groups of docks. With the closing of some of the older up river docks down river docks notably at Tilbury have been extensively developed.

Dodo an extinct bird, giant and flightless which lived on the island of Mauritius up until 250 years ago. Another species, the white dodo lived on Réunion. Some reached exceptional sizes. By the end of the 17th cent. Mauritius, Rodriguez and Réunion had all been colonised and the dodo along with many other birds vanished forever because of their inability to stand up to man and the animals imported into the islands.

Dog-days, a period of 40 days (3 July-11 Aug.) when Sirius rises and sets with the sun. The ancient superstition which can be traced back in Greek literature to Hesiod (8th cent. B.C.) was that this star exercised direct influence over the canine race.

Doge the chief magistrate in the former republics of Venice (897-1797) and Genoa (1339-1797, 1802-5).

Dogfish, a large family of small sharks seldom more than 3 ft. in length. The flesh is sold as rock salmon. The eggs are contained in horny cases called mermaid's purses. The commonest of the British dogfishes are the spur dogs.

Doldrums, a nautical term applied to those areas of the Atlantic and Pacific towards which the trade winds blow and where the weather is calm, hot and sultry but liable to change suddenly to squall rendering navigation difficult.

Dolomite a name applied to a limestone containing appreciable magnesium, also the mineral dolomite, a double carbonate of magnesium and calcium.

Dolphin, an ocean mammal of the whale order from 6 to 8 ft. long with a long sharp snout and of an active disposition. They abound in most temperate seas and swim in shoals. A few species live in large rivers (Ganges and Amazon). They can cruise for long periods at around 15 knots and produce bursts of speed in the region of 20 knots, the water apparently flowing smoothly past their bodies. Dolphins are some of the most intelligent of mammals and are currently the subject of scientific experiments in communication.

Dome a large cupola, hemispherical in form rising over the main building of a cathedral or other prominent structure. The finest existing dome, that of the Pantheon at Rome is also the oldest dating from the time of the Emperor Hadrian. It is 142 ft. in diameter and about the same in height. The dome of St. Peter's in the same city has a double shell is 330 ft. high and 140 ft. in diameter. The dome of the cathedral at Florence is 139 ft. in diameter and 110 ft. high and that of St. Paul's London has 3 shells and is 112 ft. in diameter and 215 ft. high. The circular reading room of the British Museum has a dome 140 ft. in diameter and is 106 ft. high. Malta's Mosta dome is also famous.

Domesday Book is the famous register of the lands of England framed by order of William the Conqueror. According to Stowe the name was derived from *Domus dei*, the name of the place where the book was deposited in Winchester Cathedral though by others it is connected with doom in the sense of judgment. Its compilation was determined upon in 1084 in order that William might compute what he considered to be due to him in the way of tax from his subjects. William sent into each county commissioners to make survey. They were to inquire the name of each place, the possessor, how many hides of land were in the manor, how many ploughs were in demesne, how many homagers, villeins, cottars serving men, free tenants, and tenants in socage, how much wood meadow and pasture, the number of mills and fish ponds, what had been added to or taken away from the place, what was the gross value at the time of Edward the Confessor. So minute was

- the survey that the Saxon chronicler of the time reports there was not a single hide nor one vintage of land nor even it is shame to tell though it seemed no shame to do an ox nor a cow nor a swine was left that was not set down. The record which did not take in Northumberland Cumberland Durham and parts of Lancashire and Westmorland was completed on Nov 15 1085 and was comprised in two volumes—one a large folio sometimes called the Little Domesday which deals with Essex Norfolk and Suffolk the other a quarto sometimes called the Great Domesday. The first is written on 384 double pages of vellum in one and the same hand and in a small but plain character each page having a double column. The quarto is written on 450 pages of vellum but in a single column and in a large fair character. The original is preserved in the Public Record Office. See also *Domesday*.
- Dominicans** an order of mendicant preaching friars founded by St. Dominic in Languedoc in 1215 and confirmed by the Pope in 1216. The rule of the order was rigorous. The dress was a white habit and a spicular with a long black mantle. They gave them the name of Black Friars. Their official name is Friars Preachers.
- Donjon** the keep or inner tower of a castle and the strongest and most secure portion of the structure. This was the last refuge of the garrison and there was usually a prison on the lower floor hence the name *dunjon*.
- Don Juan** the legendary hero of many famous works supposedly based on the life and character of the unscrupulous gallant Don Juan Tenorio of 14th cent. Seville. The first dramatization of the legend and the most famous is Tirso de Molina's *El Burlador de Sevilla*. Don Juan was also the subject of Moore's *Le Festin de Purse* Mozart's *Don Giovanni* Byron's *Don Juan* and Jose Zorrilla's *Don Juan Tenorio*. The latter is played on All Saints Day through out Spanish speaking countries.
- Don Quixote** the knight of the doleful countenance the hero and title of Cervantes' classic novel of 16th cent. Spain. Don Quixote de la Mancha a gentle country gentleman of lofty but impractical ideals having read many chivalric romances believes he is called upon to redress the wrongs of the world. Mounted on his nag Rosinante and accompanied by his companion Sancho Panza a hard headed and practical peasant he sets out on his journeys of knight errantry.
- Dormouse** a family of small squirrel like rodents widely distributed throughout Europe and Asia, and living mainly on fruit and nuts. It is of nocturnal habits and sleeps through the winter.
- Dot** a French term indicating the property which a wife brings to her husband on marriage and is usually settled on the woman being her separate property though the income from it may go towards the general household expenses.
- Dotterel** a handsome bird of the plover family found in northern Europe and Siberia. Nests in the Cairngorms, the Grampians and E. Ross. Very tame.
- Doukhotob** See J15.
- Drachm (or Drachma)** an ancient Greek silver coin and weight. One drachma was equivalent to six obols. The word has survived as the name of a weight. Avoirdupois, one-sixteenth part of an ounce. Apothecaries' Weight, one-eighth part of an ounce.
- Drag** Term used in mechanics for resistance offered by a fluid to the passage of a body moving through it. When speed of sound is reached drag increases abruptly. The lift/drag ratio gives the aeroplane designer his measure of aerodynamic efficiency.
- Dragon** a fabulous monster common to folk lore in most countries, generally represented as a winged reptile with fiery eyes and breath of flame. A dragon guarded the garden of the Hesperides in the New Testament there is mention of the dragon that old serpent which is the devil. St. George, England's patron saint, is supposed to have overcome the dragon. In medieval legend abundant in dragons in heraldry the dragon has also a conspicuous place and in China it was the imperial emblem.
- Dragonade** the term given to the series of persecutions of Huguenots in France in the reign of Louis XIV. just before and after the revocation of the edict of Nantes, dragons being chiefly employed in the work. Since then the term has been used in reference to any onslaught on the people by soldiers.
- Dragonet** the name of the fish of the *Callionymus* genus beau fully coloured and about a foot in length. They are common on the British coast and in the Mediterranean.
- Dragon Fly** the common name of a well known order of insects having two pairs of membranous wings and often of very brilliant colours. They are swift of flight and may be seen hovering over sheets of water in the sun shine all through the summer. Their chief food is mosquitoes.
- Dragon's Blood** a dark red resinous substance obtained from the fruit of a Malay palm and possessing medicinal virtues. In a special technique used for making line blocks in printing dragon's blood is used.
- Drama** See M40 Contemporary Theatre, II-40.
- Drawbridge** a bridge that can be lifted up so that no passage can be made across it. It was a usual feature of a fortified castle in the Middle Ages and was raised or lowered by chains and ewers. It spanned the fosse and on the approach of an attacking party was raised and formed a special barricade to the gate. Modern drawbridges are such as are raised to allow the passage of boats up and down a river or estuary. The Tower Bridge is a famous London bridge of this type.
- Drongo** The King Crow or Indian Black Drongo is frequently seen in India perched on branches or telegraph wires darting suddenly to catch insects and to attack crows and hawks. Other members of the family are found in Asia, Africa and Australia. Its plumage is black with steel blue gloss.
- Drosophila or Fruit Fly** More has been learnt by geneticists from breeding experiments with this insect than with any other.
- Dross** the name generally applied to the refuse of molten metal, composed of slag, scales, and cinders.
- Drought** a period of dry weather is a normal and recurring condition in many warm climates, and is frequently provided against by irrigation. In the British Isles really long rainless spells are somewhat rare, and an absolute drought is defined officially as a period of at least fifteen days on each of which the rainfall is less than six inches. The summer of 1959 was wholly without precedent in all parts of Britain for lack of rainfall abundant sunshine and warm weather. In South Yorkshire an absolute drought lasted 59 days, the longest period in British records.
- Drupe** is the scientific term for stone fruit. The stone forms the inner part (endocarp) of the fruit and encloses a seed or kernel which is liberated after the fleshy part (pericarp) has rotted.
- Dry-rot** the term was first used about 1775 to describe the fungal decay of timber in buildings. Creosote distilled from coal tar is the standard material for preservation of timber and pentachlorophenol and copper naphthenate are two compounds now extensively used. Dry wood always escapes dry rot. Chief fungi causing dry rot are *Merulius* and *Porcia*.
- Duck water** bird smaller than the related goose and swan, which together form the family Anatidae. Duck refers to the female drake to the male. The duck family falls into two separate groups: the river or freshwater (surface feeding) ducks such as the mallard pintail wigeon, shoveler mandarin teal, garganey and the sea (diving) ducks such as the goldeneye pochard scoter eider and the fish-eating mergansers or sawbills. The ancestor of all domestic breeds, with the exception of the muscovy is the mallard.
- Duckbill**, *Ornithonychia anatinus* also duck-billed platypus, a fur-covered egg-laying, nest-building mammal inhabiting Australia and Tasmania. It has webbed feet and a muzzle like a duck's bill and is about 20 in. long.
- Ductility** is a property possessed by most metals which renders them capable of being stretched without breaking. Gold is the most, and lead the least ductile of metals, the order being gold

silver platinum iron, copper palladium aluminium, zinc tin, lead. In animated nature the spider and the silkworm produce secretions of notable ductility

Dugongs A marine mammal belonging to the order Sirenia (sea-cows). Inhabits Red Sea and Indian Ocean also found as far East as the Philippines and Australia. Lives on sea weed. Related to the Manatee

Duke the highest rank in the British peerage next to that of a royal prince. Edward the Black Prince eldest son of Edward III who died before his father was the first English duke being created Duke of Cornwall in 1337. Since then all Princes of Wales have held that title

Dukeries a range of English woodland and park country mainly in Nottinghamshire comprising the adjacent demesnes of several English dukes and nobles. The Dukeries include Sherwood Forest and the estates of Welbeck Abbey Clumber Park, Worsnop Manor and Thoresby Hall

Dunes Sand dunes are elliptical or crescent shaped mounds of loose sand produced by wind action. The dune has a gentle slope on windward side a steep slope on the leeward side

Dunlin, very common small wading bird of the Sandpiper family nesting in Britain. Its range extends to other areas where it also breeds

Dunmow Fitch, a custom which originated in the parish of Little Dunmow Essex in the reign of Henry III. which was that the husband who was prepared to swear before the prior convent and townsfolk of Dunmow that he had not repented of marriage or quarrelled with his wife for a year and a day should be rewarded with the gift of a fitch of bacon. The custom has frequently been revived

Duncock (*Prunella modularis*) a small bird of rich brown and dark grey plumage common in gardens and hedgerows. Sings a cheerful song all the year round. Called hedge-sparrow in southern England. Another member of the same family the larger Alpine Accentor (*Prunella collaris*) is found on rocky mountain slopes of Europe and Asia

Duodecimo a sheet of paper folded into twelve leaves written 12mo

Durbar, a term used in India from the Persian word *darbar* meaning court or audience. It may be either a court for administering affairs of state or a purely ceremonial gathering. The word was applied to great ceremonial gatherings like Lord Lytton's durbar for the proclamation of the Queen Empress in 1877 and the Delhi durbar of 1911

Dust, solid particles of matter floating in the atmosphere produced chiefly by volcanic eruptions, sand storms in desert regions, and industrial and domestic smoke. When the island of Krakatoa erupted in 1883 more than 1 cubic mile of dust was thrown into the air and carried three times round the earth by the explosion wave. The particles in dust-storms are much finer than those in sand storms and are swept up to far greater heights. The local whirlwinds which form over loose dry soils are termed dust-devils

Dyke. A wall like intrusion of igneous rock which cuts across the bedding or other layered structure of the country rock. The word also signifies in alternative usage a sea wall and an open drain

Dynamine, a powerful explosive whose chief element is nitro-glycerine. It was discovered by Nobel in 1867 who absorbed nitro glycerine in kieselguhr has a disruptive force of about eight times that of gunpowder

Dynamo Machine for transforming mechanical energy into electrical energy. Depends on principle of electromagnetic induction whereby a current is produced in a conductor (e.g. copper wire) traversing a magnetic field. The two essential parts of a dynamo are the conductors or armatures and the field magnets

Dynasty, a succession of monarchs of the same family as the Carolingian dynasty, the Bourbon dynasty the Plantagenet dynasty etc

E

Eagle, large bird of prey with huge hooked bill, related to the buzzard kite, hawk, harrier falcon, and vulture, together forming the family

Falconidae. There are many species to be found throughout the world. The Golden Imperial, Tawny Spotted and Lesser Spotted being found in Europe. The Golden Eagle a magnificent-looking bird nests in the Scottish Highlands and the White tailed Ser Eagle which used to breed in Britain is now only an occasional visitor. The eagle has been the symbol of royal power since the earliest times and the American or Bald Eagle is the emblem of the United States

Earl a British title of nobility of the third rank, duke and marquis coming first and second. The title dates from Saxon times and until 1387 ranked highest in our peerage

Earl Marshal, in England ranks as the eighth of the great officers of state is head of the College of Arms attends the sovereign opening and closing the session of Parliament and arranges state processions (especially coronations) and assists in introducing newly created peers in the House of Lords. The office is hereditary in the family of the Dukes of Norfolk

Earth, our habitable globe is the third of the planets of the solar system in order from the sun and on an average throughout the year takes 24 hours to turn completely round relative to the sun, the whole earth revolving round the sun in a slightly elliptical orbit once in a year of 365 2564 days. The mean distance of the earth from the sun is 93 004 000 miles. The shape of the earth is that of an oblate spheroid its equatorial and polar axes measuring 7 927 miles and 7 900 miles respectively. Earth satellite studies have shown that it is also slightly pear shaped with the stalk towards the north pole. The scale of this effect is such that the south pole is 50 ft. nearer the centre of the earth than the north pole. The crust consists of an outer layer of surface soil of varying thickness beneath which there is a mass of hard rock several miles deep the percentage (by weight) of the principal elements present being oxygen 47 silicon 28 aluminium 8 sodium and potassium 5 iron 4.5 calcium 3.5 magnesium 2.2 titanium 0.5 hydrogen 0.2 carbon 0.2 phosphorus and sulphur 0.2. Mass of the earth is estimated to be 6 000 million million tons. Two-thirds of the earth's surface is covered with water. It has only one satellite the moon. The earth receives more light from the sun in 13 seconds than it does from the moon in one year. Weather changes are independent of the moon. A recent estimate of the age of the earth's crust is 5 000 million years. Recent discoveries suggest that the earth is embedded in the atmosphere of the sun and that some of the heat that reaches us from the sun gets here by direct conduction through interplanetary space. See F8-9

Earthquake a sudden violent disturbance of the earth's crust the region of the surface immediately above the focus or source where the earthquake originates is termed the epicentre. On account of their destructive power earthquakes have attracted attention from the earliest times but accurate study dates only from the last century and the development of a world wide network of recording stations from the present one. The majority of severe earthquakes result from fractures usually along existing faults in underlying rock strata subjected to great strains, the shearing movement sometimes extending to the surface. These dislocations set up vibrations which are propagated as waves throughout the bulk of the earth or round the crust. Frequently the main shock is followed by a series of smaller after shocks. Minor local earthquakes may be attributed to the effects of volcanic activity but most of the larger ones originate in non volcanic regions along well marked lines of weakness in the earth's crust. Generally the ground is felt to tremble, undergoing oscillations which may gradually or suddenly increase to a maximum and accompanied by sounds. Where there is movement of the sea-bed a tidal wave may result. One of the greatest of historic times was that which destroyed and flooded Lisbon in 1755. Among the notable shocks of the present century rank those of San Francisco (1906) Messina, Italy (1908) China (1920) Japan (1923) Napier New Zea-

land (1931) N.E. Asam (1950) Ionian Is (1953) Agadir Morocco (1960) Chile (1960) Iran (1962) Yugo-Slavia (1963) E Turkey (1966) W Sicily (1968) Peru (1970).

Earthworm. of which there are several species, has a cylindrical body tapering at both ends, and segmented into rings. It moves by contraction of its rings aided by retractile bristles is eyeless, but has a mouth, gullet, and stomach. Earthworms exist in immense numbers and perform an important part in the scheme of nature by loosening the soil and rendering it more amenable to tillage. They also form a valuable food for birds and many mammals, and are unequalled as bait for certain kinds of fish.

Earwig. a genus of insects possessing two pairs of wings and anal forceps. It is nocturnal, lives on vegetable matter and hides by day under stones or in flowers, *e.g.* dahlias. The old belief that it deliberately creeps into people's ears is altogether unfounded. See T330(2).

Easter the annual Christian festival in commemoration of the resurrection of Christ. The English name being derived from Eostre, goddess of Spring. The date cannot fall earlier than March 22 nor later than April 25. Many disputes arose among the early Christians as to the proper time to celebrate this day which governs all other movable feasts. It was eventually ruled at the Council of Nicaea in 325 that Easter Day should be the first Sunday after the full moon following the vernal equinox. If this happens to be a Sunday then Easter Day is the Sunday after. It should be remembered however that this moon is a hypothetical moon of the ecclesiastical calendar quite imaginary and generally one or two days later than the real moon we see in the heavens. In fact the reverend fathers at Nicaea did us a bad turn in having anything to do with the moon but then they had no Astronomer Royal to advise them of the complications. See also Section N.

Eastern Question, a term formerly applied to the problems arising from the instability of the Mohammedan power of Turkey and its relations with the other nations of Europe. Later connected with other problems of the Near East such as the possession of Constantinople and the position of the Balkan states.

East India Company was incorporated by Elizabeth in 1600. In 1613 the Company set up a factory at Surat. India, and in 1662 Bombay came under the Company's influence and developed into an important trading port. Dupleix wanted to establish French power in India and a struggle for supremacy took place. Clive gained the victory for England and thenceforward British dominion in India remained undisputed except by native princes. In 1772 Warren Hastings was appointed the first Governor-General and in 1784 Pitt's India Act established a Board of Control for the India Company. A great increase of trade resulted, and this rule continued down to 1858 when, as a result of the mutiny the Crown assumed the sovereignty. With the passing of the Indian Independence Act of 1947 British dominion ended and India was handed back to the Indians.

Eau-de-Cologne, a popular distilled perfume first manufactured at Cologne in the 18th cent. by Johann Maria Farina, an Italian, and since made in large quantities in Cologne and elsewhere.

Ebony, a name applied to various hard black woods, the best of which are grown in Mauritius and Caylon. There are also Indian and American varieties. Only the inner portions, the heartwood, of the trees are of the necessary hardness and blackness. Ebony is largely used in ornamental cabinet work, for piano keys, canes, etc.

Ecce Homo (Behold the Man!), used in reference to the pictures and sculptures representing Christ crowned with thorns.

Ecclesiastical Courts, courts for administering ecclesiastical law and maintaining the discipline of the Church of England. Introduced by the Normans. Originally they had jurisdiction over both clergy and laity. See also D38(1).

Eclipse, the partial or complete obscuring of one heavenly body by another. An eclipse of the sun occurs when the moon, which is 1/400th of the diameter of the sun and about 1/800th as far away obscures some portion of the sun as seen by an observer on the earth. A total eclipse

occurs when the whole of the sun's disc is covered by the moon. Astronomers travel many thousands of miles to observe the outer layers of the sun and its corona, which is only possible when the light from the sun is totally obscured by the moon during the few minutes of an eclipse. The total solar eclipse of March 1970 as seen from Mexico was watched by millions on their television screens. Total solar eclipses have occurred over parts of the British Isles in the years 1424 1433 1506 1655 1715 1724 1927 1954 visible from the Shetland Is. and the next will be seen only from near Land's End on 11 August 1991.

Ecliptic is the sun's apparent path in the sky the great circle described by the sun from west to east in the course of a year. The sun is exactly on the equator on approx. March 21 and Sept. 23 and the points where the celestial equator and ecliptic intersect on these days are called the *equinoctial points*. On approx. June 21 and Dec. 22 the sun reaches its greatest and least midday elevation and its greatest distance north and south of the equator and the points on the ecliptic on these days are called the *solstices* (see Seasons N10). These four points are equidistant from each other by 90°. The equinoctial points are not fixed. The angle of inclination of the ecliptic to the equator is called the obliquity of the ecliptic which is also variable being influenced by the gravitational action of the other planets on the earth. At present the angle is 23°.

Ecumenical Council, a general council of the Christian Church summoned when important questions of Church doctrine and policy are to be decided. The early councils were predominantly Greek and convoked by the emperor. Those summoned by the pope when they meet at the Lateran Palace in Rome are called *Lateran Councils* others have met at Constance Florence Trent, and the Vatican. Their decisions are not binding on the rest of Christendom. Only 21 Ecumenical Councils have been held in the history of Christendom. The first was held at Nicaea in 325 when the mystery of the Trinity was defined. The 21st (known as the 2nd Vatican Council) convened by Pope John opened in Oct. 1962 in St. Peter's Rome and ended in Dec. 1965. Two of the principal themes were the reunion of all Christians with the Church of Rome and the Church's place in the modern world. At the last session of the Council the Pope announced his decision to establish for the first time an international synod of bishops in Rome for consultation and collaboration in the government of the Roman Church. This Senate of Bishops will provide the balancing factor alongside the Curia which represents the Papacy and not the episcopacy. **Edda** the name given to two important collections of early Icelandic literature—the *Elder* or *Poetic Edda* poems handed down from the 9th and 10th cent., probably Norwegian in origin, and the *Younger* or *Prose Edda* of Snorri Sturluson compiled about 1230. They treat of mythical and religious legends of an early Scandinavian civilisation.

Eddystone Lighthouse, 12 miles south of Plymouth, is one of the most isolated in the world. The tower is 168 ft. high, and its light can be seen for 17 miles. The present structure is the fourth that has occupied this dangerous position. The first was of wood, completed by Winstanley in 1698, but it was destroyed by storm in 1706. In 1706 a second and stronger lighthouse was built by Rudyard. This lasted until 1755 when it was destroyed by fire. Smeaton built the third lighthouse of granite and this withstood storm and tempest for over a hundred years, 1756-1861. The present lighthouse also of granite, was built 1870-81 on a nearby rock by Sir James Douglas.

Edelweiss, a white perennial flower of the daisy order, common in Alpine regions.

Education, History of. See E15.

Eels, edible fishes of the order Apodes, with snake-like body covered with minute scales embedded in the skin. The common or freshwater eel *Anguilla anguilla* is found in the Atlantic coastal areas of E. America and Europe and in the Mediterranean and breeds S.E. of Bermuda. The electric eel of S. America

is a variety of great interest being able to cause electric shocks

Egret a slender graceful bird of the heron family of pure white plumage famed for its beautiful silvery plumes (agrettes) which appear in the breeding season and for which it was ruthlessly hunted and would have been exterminated had not international action been taken to protect it. The Little Egret with black bill black legs and yellow feet breeds in Mediterranean lands

Elder a large diving duck, found along the rocky coasts of northern latitudes well known for the beautifully warm soft down, called elder down which the female bird plucks from her breast to line her nest. In Norway and Iceland the haunts of the elder are preserved and the birds protected by law on account of the much prized elder down, which is collected from the nests just before the breeding season. Elder down is so elastic that a pound or two of it will fill an ordinary bed covering

Eiffel Tower built by the French engineer Alexandre Gustave Eiffel (1832-1923) for the Paris Exhibition of 1889. The tower which is made of iron is 985 ft high and weighs about 7 000 tons

Eisteddfod (a sitting) was originally a congress of Welsh bards and minstrels and dates from before the 12th cent. These assemblies, discontinued for a long period were resumed in 1819 and have been held yearly since each lasting three or four days. Their object is to foster the Welsh patriotic spirit they are devoted to orations and competitions in poetry singing and harp playing prizes being awarded to the successful contestants

Eland, largest species of antelope native of Africa. large pointed horns stands 5 feet high at the withers and weighs several hundred pounds

Elder small trees of the *Sambucus* genus, with pinnate leaves and clusters of white flowers and later small purplish black berries. The black elder the best known, is common in most parts of Europe and thrives in Britain. A wine is made from its berries.

El Dorado a golden land was an idea much favoured in the days of the early Spanish explorers. It was believed that somewhere on the South American continent there was a country abounding in gold and precious stones. Many expeditions were fitted out to discover it. Sir Walter Raleigh also went forth on this illusive quest. The term is still used in regard to any place of rich promise

Electret a piece of solid matter which retains a permanent electric polarisation analogous to the magnetic polarisation of a permanent magnet. There are various recipes for making them. carnauba wax is a common constituent

Electricity See F18 also Energy Conversion.

Electric Light is produced in several ways, commonly by causing a tungsten wire to heat up to incandescence by passing a current through it. Current may also be forced through ionised gases causing them to glow. Such discharges include neon lights sodium and mercury vapour street lamps and various intense electric arcs used for technical purposes. In fluorescent lights an electric discharge causes ultra-violet (invisible) light, which then excites luminosity in certain chemical substances called luminescent materials. Other forms of electric lighting are being investigated.

Electric Telegraph may be said to date from 1836 when Sir Charles Wheatstone and his co-inventor Cooke introduced their Single Needle instrument, which was soon followed by the Double-Needle apparatus. Morse, in 1837 invented his famous recording instrument. The first electric cable was between Dover and France and was laid in 1850. The first Atlantic cable was laid in 1858 and the second in 1866. It was in 1899 that the first Marconi wireless telegraph messages were sent between England and France

Electroencephalograph an instrument which records the minute voltages produced by the electrical activity of the brain by means of electrodes taped to the scalp. The record of brain waves known as EEG shows that there is a general cycle of activity in the brain that underlies both sleep and wakefulness

Electrolysis is the condition established when an electric current passes through a conducting sub-

tance between electrodes resulting in decomposition and separation into constituents. Water thus becomes decomposed into hydrogen and oxygen

Electromagnetic waves See F13

Electrometer an instrument for measuring differences of electrical potential. The moving part, perhaps a needle is affected by electrostatic forces and no current flows through the instrument. High sensitivity can be obtained

Electron See F10 14

Electron Microscope A microscope in which beams of electrons are focused by magnetic lenses in a manner analogous to the focusing of light beams in the ordinary optical microscope. Modern electron microscopes have very high resolving power and can magnify up to 1 500 000 times making it possible to explore the cell and the virus. A development of the electron microscope is the scanning electron microscope (stereoscan) recently developed at Cambridge which can examine an essentially thick object giving a very large depth of focus. See F27(2)

Electronvolt unit of energy used in nuclear physics. It is the amount of energy required to move one electronic charge through a potential difference of one volt. It is very small— 1.6×10^{-19} ergs—and therefore suited to atomic physics. 1 MeV = a million electronvolts and this larger unit is used in nuclear energy physics

Electronics The science which deals with the behaviour and control of free electrons. It started with the discovery of the electron by Sir J. J. Thomson in 1897. The practical applications constituting electronic engineering have given us radio radar photo-electric cells, cathode ray oscillographs, electron microscopes, television. Nowadays electronics uses devices like transistors such that the electrons move inside solid matter instead of *in vacuo*. This is sometimes referred to as solid state electronics

Electrophorus a simple device for producing static electricity consisting of a smooth disc of resin or ebonite mounted on a metal base and with a metal cover carrying an insulated handle. The disc is first electrified (negatively) by rubbing it with a dry catkin or flannel and the cover replaced, the upper surface receiving a positive charge and the lower a negative. On lifting off the cover after having touched it with the finger the negative charge runs away to the earth and the positive charge is isolated on the cover. The action may be repeated a number of times before it is necessary to replenish the original charge on the disc. Of historical interest only

Elements In chemistry an element is a substance in the simplest form to which it has been reduced. Ninety elements are found naturally on the earth, one is observed spectroscopically in the stars and a further twelve have been made artificially. Between them these elements can appear in some 1 200 different isotopes of which 817 occur in Nature. (There are 274 stable isotopes among 81 stable elements.) See F20 also F66

Elephant a proboscidean mammal of which only two species survive—the Asiatic in India and the African elephant. No other animals possess a trunk. Both males and females have large ivory tusks of considerable commercial value. The Indian elephant is usually about 9 ft high and weighs about 3 tons. African elephants are larger, weigh about 6 tons, and are usually much fiercer. Several fossil elephants of still larger bulk have been discovered including the mammoth and the mastodon. The Indian elephant is domesticated and used as a beast of burden, and may live 70 years.

Eleusian Mysteries, festivals common throughout ancient Greece agricultural in their symbolism.

Elgin Marbles, a collection of ancient Greek sculptures and architectural fragments got together by the 7th Earl of Elgin and brought to England between 1802 and 1812. These celebrated treasures had originally formed part of the Parthenon at Athens and were probably carved by pupils of the sculptor Phidias. Lord Elgin expended over £70 000 upon them, and they were purchased for £35 000 for the British Museum where they can now be seen displayed

Elk, the largest animal of the deer family possess

ing enormous antlers, and standing when mature about seven feet high. The American moose is of the same family.

Elm, a stately wide-spreading tree having some 20 species spread over north temperate regions, several of which are native and peculiar to Britain. The grandest of the field elms is the English elm, *Ulmus procera*, which may reach a height of 140 ft and a girth of 25 ft. The wych elm *U. glabra* or Scots elm is a valuable hardwood and used in boat building.

Elzevir the name of a celebrated family of Dutch printers who produced editions of Latin French and German classics which were highly valued for their beauty of type and accuracy of printing. They flourished in the 17th cent.

Embalming the process by which dead bodies are preserved from decay by means of spices and drugs. The art reached perfection in ancient Egypt, as the mummies which still exist so powerfully testify. In modern times many experiments in embalming have been tried, with various degrees of success.

Ember-days are set apart for fasting and prayer in the Western Church at the periods appointed for ordination viz. the Wednesday Friday and Saturday after the first Sunday in Lent; Whit Sunday Sept. 14 (Holy Cross Day) and Dec. 13 (St. Lucia's Day). They are of very ancient origin.

Embossing the art of stamping in relief letters or designs upon pliant substance.

Embryology that branch of biology which deals with embryos tracing their development from fertilisation of the germ or seed to birth.

Emerald The rich green variety of beryl (beryllum aluminium silicate). The colour is due to the presence of chromium oxide.

Emery a granular substance of the corundum order generally mixed with other metallic substances and used in a powdered state for polishing and grinding purposes. Emery is mined in Asia Minor and the Grecian archipelago.

Enamel, a vitrified substance applied as a coating to pottery and porcelain. The art was practised by the Assyrians and Egyptians and was introduced into Europe by way of Greece. Enamels are all either of the transparent or opaque kind and are susceptible to an immense variety of colouring according to the metallic oxides introduced.

Encaenia, a festival commemorating a dedication at Oxford University the annual commemoration of benefactors accompanied by the conferring of honorary degrees is held in June.

Encyclical Letters, a term used in reference to letters addressed by the Pope to his bishops upon matters of doctrine or discipline.

Encyclopaedists, a term first applied to the eminent writers who collaborated in the French *Encyclopédie* (1751-66). They included Diderot, D'Alembert, Voltaire, Helvetius; their writings generally were sceptical as to religion, destructive as to politics, and had great influence in popularising the social ideas which afterwards resulted in the French Revolution.

Energy One of the most fundamental concepts of science. A body in motion possesses *kinetic energy* as a result of the work done by the forces creating the motion. But a force which does work to stretch a spring does not create motion. Instead the work is stored up in the spring and is one example of *potential energy*. A raised body also possesses potential energy which turns into kinetic when the body falls. The *heat energy* contained in a body is the sum of the kinetic and potential energy of the constituent atoms which are vibrating all the time. Heat and motion are obtainable from electrical magnetic chemical atomic and other sources and physicists therefore define corresponding forms of energy. The vital point is that all forms of energy are transferable into one another *without loss or gain*. This is the Law of Conservation of Energy. It is one of the most fundamental laws of science, and its general validity is the reason why energy is an important idea. Since Einstein, it has been recognised that mass also is interchangeable with energy. See **PLS**, also **Nuclear Energy**.

Energy Conversion. For practical purposes it is frequently necessary to change energy from one into another of its many forms. Indeed

almost every activity does this in one way or another. The primary sources of energy are the sun, uranium and other elements from which nuclear energy can be drawn, and the tides. The sun is not much used *directly* because its heat is intermittent and not very intense but solar cookers and refrigerators have been invented and solar batteries for use in spacecraft. The sun can be used *indirectly* because it has produced the *divers processes* of fossil fuels like coal and oil and still continues to generate winds, rain, and rivers and hence hydroelectric and wind power (commonly both fossil fuel and the energy of river or tidal waters are converted into electricity). Windmill type electricity generators are also quite common. The bulk of electricity produced is a two-stage process: first fossil or nuclear fuel is used to create heat (see **Nuclear Reactions**); then the heat is used to raise steam and drive generators. Efforts are being made to convert heat into electricity more directly e.g. by using thermoelectric or thermionic effects (see **PLS**). These have not been used for large-scale production. Once electrical energy is available, it can be used in many different ways: in factories and in domestic batteries in great numbers and there can be used as portable energy sources as can petrol and other *internal* forms of fossil fuel. See **Battery Fuel Cell**.

English Language. See **MAA**.

Engraving is the art of cutting or otherwise forming designs of pictures on wood, stone or metal surfaces for reproduction by some method. Wood-engraving was the earliest in the field dating from the 15th cent. Later engraving on steel and copper plates was introduced and mercurial lithography still is a quaint etc. Most modern methods of reproduction are based on photography.

Ensalade, a method of curing and preserving fodder vegetables etc. in salt dug in the ground and excluded from air or light. The system was practised in ancient Rome and revived in England in the 19th cent.

Entablature that portion of a building which surmounts the columns and extends to the roof of the tympana of the pediments. It comprises the architrave, the frieze and the cornice.

Entomology is the study of insects. See **Insects**.

Entrepreneur. An entrepreneur or undertaker is a firm which brings together the factors of production needed for producing goods or services undertaking the risks and uncertainties involved—though it may transfer some of them by insurance or by other methods. The entrepreneur may be either an individual or a company or corporation private or public.

Enzymes. Organic catalysts which accelerate chemical processes occurring in living organisms. There are a large number present in the cell and most have a high degree of specificity. Enzyme mechanisms are the key to basic biological processes. See **P25(1)** 30(1).

Epaulette, a shoulder badge fringed with cord, worn by English army officers until 1855 now confined to naval officers, and varying in form and richness according to the rank of the wearers.

Ephemeroptera or **May-flies**, an order of insects. In the larval condition they exist from two to three years aquatically but no sooner do they arrive at maturity than their lives are hurried to a close. They rise up in swarms in warm summer nights take no food propoacae and perish. The Latin name expresses the fact that the adults have an ephemeral existence.

Ephod, a vestment worn by a Jewish high priest and sometimes by priests of lower rank. In older times it was of rich texture and set with gems.

Epiphany, a church festival celebrated on January 6 Twelfth Day.

Equator the imaginary great circle of the earth, every point of which is 90 degrees from the earth's poles, and dividing the northern from the southern hemisphere. It is from this circle that the latitude of places north and south is reckoned. The celestial equator is the circle in which the plane of the earth's equator meets the celestial sphere (the imaginary sphere in which the observer is at the centre, used for representing the apparent positions of the heavenly bodies).

Equinox, the time when the sun crosses the plane

of the earth's equator making day and night of equal length

Eras are distinctive periods of time associated with some remarkable historical event or personage. *The Christian era* is computed according to a 6th-cent reckoning to begin with Jesus's birth A.D. 1. The date is placed some years too late. Scholars now believe that Jesus was born c. 6 B.C. *The Jewish era* dates from 3761 B.C. *The Julian era* from the alteration of the calendar by Julius Caesar 45 B.C. *The Mohammedan era* from the date of the *Hajra* or the flight of Mohammed from Mecca to Medina which is A.D. 622. July 16, in the Gregorian Calendar.

Erbium belongs to the group of rare-earth metals discovered by Mosander in 1842.

Erg the unit of work and energy in the centimetre-gram-second system, the energy involved when a force of 1 dyne moves its point of application through a distance of 1 cm.

Erl King a forest fiend of German mythology who lured children from their homes and carried them off. In Goethe's ballad the Erlkönig it is a traveller's child who is lured to destruction.

Ermme See *Stoat*.

Ernie, the name given to the electronic random number indicator equipment, the electronic machine which selected the prize-winning numbers in the first Premium Bond draw held June 1-2 1957.

Eros. This asteroid is 15-20 miles in diameter. It comes closer to the earth than any other member of the solar system with the exception of the moon and several very small asteroids. Determination of solar parallax based on observations of Eros in 1930-31 yielded the most accurate estimate of the distance of the sun from the earth (93 004 000 miles).

Ers a term used by Lowland Scottish and English writers for the Gaelic language spoken in the Highlands of Scotland. Sometimes erroneously applied to Irish, the Gaelic language as spoken in Ireland and revived as an official language in recent times. Dr Johnson, Sir Walter Scott and other writers used *Ers* to signify Scottish Gaelic. The language of the Scottish Lowlands (that used by Robert Burns) is related to the English language and not to Gaelic and is variously termed Scots, Broad Scots, the Doric, the Scottish vernacular and fashionably of late Lallans.

Escorial or **Esorial**, Spanish monastery built in the mountains near Madrid by Philip II to commemorate the victory over the French at Saint-Quentin (1557). A palace was added later and it also includes a church library and royal mausoleum. Built in granite in sombre style. It is one of the finest buildings in Europe.

Eseuteuchon a shield shaped surface called a field upon which a man's armoinal bearings are represented. A woman's is lozenge shaped.

Esparto Grass grows in great abundance in Spain and North Africa and the pulp is largely used for paper making as well as for other purposes.

Esperanto an artificial international language created by L. Zamenhof of Warsaw and first published in 1887. It does not seek to replace national languages but to serve as a second language for international communication. It is based on the internationality of many words in the principal modern languages and is entirely phonetic in spelling and pronunciation.

Esquire formerly a title applied to a young man of noble birth who attended on a knight and carried his shield. The title ranked next below that of knight and was applied to the eldest sons of knights and the younger sons of peers. Later it became a courtesy title and given to any man as a mark of respect.

Essential Oils are oils derived from plants by distillation or expression, and much used in perfumery as well as to some extent in medicine.

Estate Duty is the duty payable upon the value of all property passing on the death of any person. The charge to duty is not limited to property owned by the deceased but may extend to other property e.g. to trust funds from which the deceased received income in his lifetime and to gifts made by the deceased within seven years of his death (one year in the case of a gift for public or charitable purposes). For deaths occurring after 30 March 1971 estates not over

£12 500 are exempt from duty. On estates of a higher value duty is chargeable by reference to rates ranging from 25 per cent to 85 per cent on successive slices of the estate.

Estates of the Realm in Great Britain are the Lords Spiritual, the Lords Temporal and the Commons. They are the great classes invested with distinct political powers and whose concurrence is necessary to legislation.

Esters Organic chemicals formed by combining an alcohol with an acid. They have a pleasant smell and occur naturally in plants as the scent of flowers. Manufactured for use in the perfumery industry and as flavourings in food. Some esters are used as solvents notably amyl acetate (pear drops) in quick-drying paints. The polymeric fibre Terylene consists of chains of molecules containing many ester groups formed by reacting an alcohol having two alcoholic (OH) groups with an acid having two acid (COOH) groups.

Etching a process of engraving on copper usually the design being drawn with a steel needle and the lines produced by the action of an acid.

Ether in chemistry is a volatile inflammable liquid composed of carbon, hydrogen and oxygen. It is a valuable anaesthetic obtained by heating alcohol with sulphuric acid. In physics in the 19th cent. all space was supposed to be filled with a substance called ether the chief property of which was to carry light waves i.e. light was supposed to be waves in this all pervading medium known as the ether. Speculation and experiment concerned with the ether were very fruitful in advancing physics. Ultimately the attempts by Michelson and Morley to detect the motion of the earth through the ether were unsuccessful in this respect but profoundly successful in stimulating the theory of relativity. The ether concept has now been abandoned. See also F15(1).

Ethylene A gas compounded of carbon and hydrogen. It is related to acetylene and ethane. Industrially it is obtained as a by-product in petroleum refining. It has wide uses as a starting material in the industrial manufacture of intermediates especially alcohol. Its most important application is in the production of polythene (poly-ethylene). See Catalyst.

Etruscans people believed to have come from Asia Minor who colonised Italy about 900 B.C. settled in what is now Tuscany and part of Umbria reached the height of their civilisation about 500 B.C. and were ultimately absorbed by the Romans. They were skilled technicians in bronze, silver and goldwork, and excelled in the art of granular decoration.

Etymology treats of the science and structure of words, including classification and derivation.

Eucalyptus. This genus includes 300 species of evergreen leathery leaved trees native to Australia. The oils yielded by different species vary a great deal in their scent and other properties and are chiefly used in pharmacy and perfumery about 30 species produce oils suitable for medicinal purposes. Various species produce timber.

Euro-dollar Market An international financial market located mainly in Britain and Europe for lending and borrowing dollars i.e. titles to dollar deposits in United States banks. See Section G Part IV.

Europium, element discovered by Demarcay in 1906, a member of the rare-earth metal group.

Evaporation is the process by which a solid or liquid is resolved into vapour by heat. The opposite process is condensation. Wherever a liquid or solid surface is exposed, evaporation takes place into the space above. If the vapour is continually removed the solid or liquid vanishes into vapour the higher the temperature the quicker the process. If the vapour is confined, then it collects, getting more concentrated until as many atoms of vapour are condensing as are evaporating. The vapour is then said to be saturated. Evaporation of water from sea, soil, plants skin etc., is continuously in progress so it is a process of fundamental importance to meteorology, botany, physiology, industry not to speak of human comfort and homely activities such as laundering.

Everest Expeditions. For many years after Mt Everest had been shown to be the highest

mountain in the world political conditions in Nepal lying south of the summit and in Tibet to the north, prevented mountaineers from attempting an ascent. At last in 1921 the Tibetan authorities gave permission and the first expedition organised, as were all subsequent British expeditions, by a joint committee of the Royal Geographical Society and the Alpine Club and led by Col C. H. Howard-Bury was sent out. This was primarily a reconnaissance besides mapping the northern flanks it found a practicable route up the mountain. By 1939 six further expeditions had climbed on the northern face. Some were balked by bad weather others by problems previously little known such as the effect of high altitudes on the human body and spirit. Nevertheless notable climbs were accomplished. In 1924, for example Col E. T. Norton reached 29,165 ft. and it was on this expedition that G. T. Mallory and Andrew Irvine were seen going well at about the same height. They never returned however and what disaster befell them is not known. After the war political conditions again closed the Tibet route permission was eventually obtained from the Nepalese Government to make the attempt from the south. In 1951 a reconnaissance expedition under Eric Shipton reached the ice fall at the exit of the Western Cwm (a high valley lying south west of the massif) and reported favourably on the prospects for an ascent. The first attempt from this side was made the following year by a Swiss expedition led by Dr. T. W. Wyss-Dunant two members of which made an attempt on the summit but were stopped at approx 28,200 ft. by the intense cold and the very strong winds. When the British 1953 Expedition led by Col. John Hunt (now Lord Hunt) was being organised stress was laid on three main points proper acclimatisation of the climbers, use of oxygen for the final stages and the establishment of very high altitude camps, so that the final assault parties would set out fresh and unencumbered. Great attention was also paid to recent developments in diet clothing and equipment. In all these matters the 1953 expedition was able to draw on the accumulated experience of their predecessors. By the end of April, a base camp had been established below the ice-fall, and with the aid of thirty four Sherpa porters supplies had been carried up into the Western Cwm. The next critical stage was the ascent of the steep head of the cwm, the Lhotse face, with the threat of avalanches always present. By most strenuous efforts, a camp was established on the South Col (28,800 ft.) on May 21. From this camp on May 26 T. D. Bourdillon and R. C. Evans climbed the South Peak of Everest (29,720 ft.), then the highest altitude ever attained. On May 28 Edmund Hillary and the Sherpa leader Tenzing Norgay spent the night at the highest camp (27,900 ft.) and on the following day May 29 climbed to the South Summit negotiated the difficult final ridge and reached the summit of Everest—the climax of a long, arduous, and stirring endeavour.

Evolution, in the words of Sir Julian Huxley "a natural process of irreversible change which generates novelty, variety and increase of organisation." The theory as laid down by Darwin, is that all existing species, genera, and classes of animals and plants have developed from a few simple forms by processes of change and selection. Up to the time of Darwin a large part of the civilised world believed that life had been created suddenly at the beginning of the world which God had created, according to Archbishop Usher on 23 Oct. 4004 B.C. The evidence of the rocks, however, has given a more convincing theory of creation, and by studying the fossils preserved in the various layers of the earth's crust the past history of the earth's life has been pieced together. Darwin has been called the Newton of biology. See F46.

Excommunication, exclusion from the rights and privileges of the Church. It is of two kinds—the major which means a total cutting off, and the minor which shuts out only from participation in the Eucharist. In medieval times, major excommunications were often launched against rulers and leaders

Exchequer which derives its name from the checkered tablecloth on which accounts were calculated in early Norman times is a term connected with the revenues of the Crown. In former times it had jurisdiction in all revenue matters. The exchequer is now assigned to the Governmental department which deals with the public revenues, the *trésorier*, and it which is the Chancellor of the Exchequer. See J18.

Exploration. Modern exploration began in the second half of the 15th cent. with the voyages of the great Portuguese and Spanish discoverers. They were followed by sailors of other European nations who profited from their developments in navigation and from their charts, and in less than one hundred year the coast lines of much of the Americas, Africa and south west Asia had been revealed and the globe circumnavigated. The motives of these early explorers were mixed: they were seeking adventure, trade, plunder, national power and the conversion of the heathen. Few if any were directly interested in advancing scientific knowledge. But from the reports of their voyages and travels scholars at home compiled descriptions of the strange new world which stimulated their successors to undertake more systematic enquiries. One of the earliest English credits is to be despatched for scientific research was that of William Baffin on the *Arctica* which was sent out by the Admiralty in 1696 to examine the coasts of North west Australia. In the 18th cent. British explorers were at work mainly in the Pacific Ocean with the object of breaking the Spanish monopoly of trade. Capt. James Cook sailed thither in 1769 to observe the first transit of Venus at Tahiti, and then to search for the alleged great southern continent. On this voyage he discovered and charted much of the coasts of New Zealand and the east coast of Australia. On his second voyage he was the first to sail across the Antarctic Circle, and he showed that the southern continent was much smaller than had been supposed. By 1800 the general outlines of the continents, except for Antarctica were known and explorers in the 19th cent. were largely engaged in opening up the interiors. In Africa British explorers solved two problems which had puzzled men for centuries. Mungo Park and Richard Lander established the true course of the River Niger and Sir Richard Burton, Speke and Samuel Baker and others revealed the true sources of the Nile. The greatest African explorer of that age was undoubtedly David Livingstone the missionary, who in three great journeys explored the Zambesi and the region of the Great Lakes, spreading the Gospel, fighting the slave trade, and opening up the interior to settlement and trade. In North America Alexander Mackenzie was the first to cross the main breadth of the continent from sea to sea. In Asia motives were also mixed: men like Charles Doughty, who explored in Arabia, and Sir Francis Younghusband, who journeyed from China to India across the Gobi and the Himalaya, were impelled by a love of adventure and the quest for knowledge, but political considerations were often involved. In recent years, with the main features of the world's surface known, exploration has become more intensive. Teams of scientists go out to study restricted areas in detail. An Antarctic expedition can contribute to our knowledge of world weather or by biological research into the life history of whales, can help to improve our food supplies. Similarly expeditions in Africa can help to check the loss of valuable agricultural land through soil erosion, or to develop areas of settlement by schemes for irrigation and power. And there are still great areas to be adequately mapped. All these problems are inter related, and in solving them the modern explorer can call on many improved techniques and instruments—the aeroplane, the aerial camera, tracked motor vehicles, radio, in fact all the resources of modern science. But the human element is still vital and for those with the old explorers' spirit there will always be problems left to solve.

Explosives, substances which burn violently to produce gases in such volume that an explosion

is induced. Gunpowder was the first explosive to be used. Roger Bacon's powder consists of charcoal sulphur and saltpetre, was the only effective explosive until the 19th cent. but it was difficult to control. Nitroglycerine (glyceryl trinitrate) was first compounded in 1847 by adding glycerine to a mixture of sulphuric acid and nitric acid. In 1866 Alfred Nobel discovered how to make dynamite by absorbing nitroglycerine in the fine sand kieselguhr. Cordite was the joint invention of Sir Frederick Abel and Sir James Dewar (1889). It came into general use as a propellant. High explosives providing bursting charge for shells and bombs include TNT (trinitrotoluene), picric acid, cyclonite (RDX) and many others. Slurry explosives can be pumped on to the site and therefore offer advantages in transportation and safety; they are also waterproof. Chemical explosives have been eclipsed by nuclear explosives which have developed from the first atom bomb (dropped on Hiroshima 6 August 1945) to the 100 megaton hydrogen bomb.

Expressionism, a modern art movement confined primarily to the non Latin countries of Europe which sought to give expression to intimate and personal emotions by means of distortions of line and colour and simplified style which carried a greater impact in terms of feeling. Broadly speaking this has been characteristic of northern art in general. (See Gothic). The term is usually used of the modern movement which influenced the Post-Impressionists and subsequent movements in France. Ired of the naturalism of the Impressionists such artists as van Gogh, Gauguin, Matisse and Rouault together with the Fauvists (*a v*) made use of simple outlines and strong colours. Apart from Toulouse Lautrec, the principal Expressionists were Norwegian like Munch or German like the painters of *Die Brücke* and *Der Blaue Reiter* groups. Individual artists were Ensor, Kokoschka, Nolde, Rouault and Soutine.

F

Fabian Society. See J18.

Fables are fictitious narratives intended to enforce some moral precept and may be either in prose or verse and deal with personified animals and objects or with human beings. Aesop in ancient times and Hans Christian Andersen and the Brothers Grimm (in many of their stories) in later days have given fables. Mention must also be made of La Fontaine's and Krylov's fables.

Faience, a kind of decorated glazed earthenware invented in Faenza, Italy about the end of the 15th cent. Wedgwood ware is a notable example of modern faience.

Fairs were established in medieval times as a means of bringing traders and customers together at stated periods and formed the chief means of distribution. The great English fairs of early times were those of Winchester and Stourbridge near Cambridge. Traders from the Netherlands and the Baltic gathered there with the great merchants of London and goods of every kind wholesale and retail were sold. The British Industries Fair is the modern counterpart of the medieval trade fair. One of the biggest trade fairs was at Nijni Novgorod founded in the 17th cent. other big continental fairs are those of Leipzig (founded in the 12th cent.), Lyons, and Prague.

Fairy Rings are the circles caused in grassland by certain fungi. The circles expand outwards as the fungus spreads, the fruiting bodies being at the periphery. Farther inward where the fungi are decaying the grass grows more strongly fertilised by the nitrogen released from the rotting fungi. In olden times these rings were held to be the scene of fairy dances.

Falcon, name given to diurnal birds of prey which belong to the same family *Falconidae* as the hawk, eagle, buzzard, kite, and harrier. They are swift of wing and feed on birds and small mammals. These birds have long pointed wings, strong hooked and notched bill, long, curved claws, and an eye of great power. They are found all over the world. Those that breed in Britain are the Kestrel (the most common), Hobby (one of the swiftest of European birds),

Merlin and Peregrine, a swift and magnificent bird with slate grey back, blackish crown, black moustache and whitish breast. Other members of the family are the Gyr Falcon from northern latitudes, Iceland and Greenland which is a winter visitor to Britain, the Lanner Saker, Eleonora's falcon, Red footed alcon and the Lesser Kestrel. The Gyr Falcon and the Peregrine were used in the sport of falconry in olden times. Because of its fearlessness and larger size the female bird was used. When the quarry was sighted the bird was unhooded set free and after mounting high into the air would dart swiftly down to strike the prey. The heron was the usual victim.

Fall-out. Radioactive material produced by nuclear explosions which may cause bodily and genetic damage. (1) *Local fall out* due to the return to earth of larger particles occurs locally and within a few hours after the explosion. (2) *Tropospheric fall out* due to particles which remain in the troposphere and come down within a month or so, possibly all over the world, but within the altitude in which the explosion occurred. (3) *Stratospheric fall-out* which comes from fragments taken up into the stratosphere and then deposited in the course of many years uniformly all over the globe. The two radioactive materials which have given rise to the greatest concern for the health of the individual are strontium 90 and iodine 131. Both these materials are liable to become concentrated in certain parts of the human body, strontium 90 in bone and iodine 131 in the thyroid gland. Radiation exposure may produce genetic effects that is effects which may show up in succeeding generations. An extensive survey has been carried out by scientists of the U.S. Atomic Energy Commission on the islands of the Bikini atoll site of some 23 nuclear tests 1946-58. Their records published in 1969 reveal that the intensity of radioactivity underneath the point of explosion is still exceedingly high. Most of the radiation remaining is due to the radioactive isotope caesium 137. The variation in intensity from one place to another seems to be correlated with the variations of vegetation where there was little vegetation weathering had been rapid. (The nuclear test ban treaty 1963 applies to all nuclear tests except those held underground.)

Fantail, a variety of the domestic pigeon also a genus of Australian birds of the *Muscopodidae* family. A small New Zealand bird is called a fantail.

Fan Tracery a complicated style of roof vaulting elaborately moulded, in which the lines of the curves in the masonry or other material employed diverge equally in every direction. It is characteristic of the late Perpendicular period of Gothic architecture and may be seen in St. George's Chapel at Windsor and the Chapel of Henry VII at Westminster Abbey.

Farmer-General the name given to the financiers who in the days of the old French monarchy farmed certain taxes contracting to pay the Government a fixed sum yearly on condition that the specified taxes were collected and appropriated by themselves. The revolution of 1789 swept Farmers General away.

Fascism. See J19.

Fata Morgana, the name given to a curious mirage often observed over the Straits of Messina attributed to the magic of the fairy Morgana, half sister of King Arthur who was fabled to live in Calabria.

Fathers of the Church were early writers who laid the foundations of Christian ritual and doctrine. The earliest were the Apostolic Fathers (*q.v.*). The Four Fathers of the Latin Church were St. Ambrose, St. Jerome, St. Augustine and St. Gregory the Great. The Four Fathers of the Greek Church were St. Basil, St. Gregory Nazianzen, St. John Chrysostom and St. Athanasius.

Fathom, a nautical measure the six foot stretch of a man's arms. It is to be replaced by the metre on British Admiralty charts, but will continue on yachtsmen's coastal charts.

Fats are important foodstuffs. In physiology they constitute a valuable form of reserve food. They contain carbon, hydrogen and oxygen, chemically they are described as esters of

glycerol (glycerine) Commonest fats are stearin, palmitin, and oleic esters formed by the combination of glycerol with stearic, palmitic and oleic acid respectively. Fats are converted into soap by alkali. This process (saponification) also releases glycerol.

Fault a term designating a breakage coupled with displacement of geological strata.

Fauvism (Fr. *fauve* = wild beast; a term contemptuously applied to the work of a group of French painters led by Matisse who exhibited at the Salon d'Automne in Paris in 1905. Their belief was that a painting must be not only a consistent and harmonious decoration but the expression of an idea or feeling. Forms and colours are emotive in their own right. The objects painted by the Fauves though simplified, distorted and often violently coloured are easily recognisable. Inspiration for their highly decorative canvases came from many sources: Byzantine and Persian art in the case of Matisse; German Expressionism in the case of Derain and Vlaminck. The Fauves paved the way for the Cubists (Braque joined Picasso in 1909) who approached nature in more arrogant mood from a more intellectual point of view.

February the second month of the year contains in ordinary years 28 days, but in leap years 29 days. When first introduced into the Roman calendar by Numa c. 700 B.C. it was made the last month of the year preceding January but in 452 B.C. the position of the two months was changed. February follows in January.

Federation See under Confederation.

Félibrige a movement founded in 1854 to revive the ancient *Florès* of Provence initiated by the French poet Frédéric Mistral.

Felspar the name given to a group of minerals: silicates of aluminium with some calcium and sodium or potassium which make up probably more than half of the earth's crust. It is formed in granite and other rocks both igneous and metamorphic.

Fenestella, the niche set apart on the south side of the altar for the piscina in Roman Catholic churches.

Fermentation the action of chemical ferments or *enzymes* in bringing about chemical changes in the materials of living animals and plants, e.g. the breaking-down of sugar by yeast into alcohol.

Ferret a carnivorous animal of the Pole-cat family with a pointed head and long sinuous body well adapted for following rabbits and game into their burrows and hiding places. It is kept in this country for that purpose. It is a native of Spain and Africa, and does not exist in England in a condition of natural freedom. See under *Mustelidae*.

Ferrites are compounds containing iron, oxygen and one or two of a certain range of other possible metallic elements. Ferrites have recently become very important technically because unlike ordinary magnetic materials they combine strong magnetism with electrical insulating properties. Ferrite-rod aerials are now common in portable radios, and ferrite devices are used in radar. See F20(1).

Fetendism. See J20.

Fieldfare, the largest member of the thrush family a regular winter visitor to Britain from Scandinavia. It is brown in colour with a lighter spotted breast and a grey head.

Field-Marshal, the highest ranking title in the British army and only bestowed on royal personages and generals who have attained great distinction. The first British Field Marshal was created in 1736 when John, Duke of Argyll had the title conferred upon him by George II.

Fifth Column. When Franco, the Spanish dictator revolted against the Spanish Republic in 1936 and attacked Madrid with four armies, he declared that a group of fascists within the city was assisting the besiegers. The term is used to describe a body of spies behind a fighting front.

Fighting-Fish, small pugnacious Siamese fish with long caudal and ventral fins. They are kept in glass globes in Siam, and when brought into contact will fight to the death, these encounters being the occasion of much gambling.

Filibuster, a name first given to pirates and

buccaniers in the 17th cent. who took possession of small islands or lonely coast lands and there maintained themselves apart from any governing authority. In later times the term was used to specify men taking part in expeditions whose object was to appropriate territory of a country and settle upon them in disregard of international law. The most notable expeditions of this kind in modern times were those of Narciso Lopez against Cuba in 1840-51 and of William Walker against Nicaragua between 1855 and 1860. Both leaders were captured and executed. The term is also used to express the right of a minority in the United States Senate for unlimited debate which is used on occasions to delay legislation.

Finches a large family of small birds belonging to the Passerine or perching order of birds. There are about 200 species, including greenfinch, hawfinch, chaffinch, goldfinch, siskin, bullfinch, crossbill, linnet, twite and buntings.

Fir a cone bearing tree with small evergreen leaves and of considerable use as timber. There are two types: the Silver Fir and the Douglas Fir. Numbering about 20 species, all these firs attain to a considerable height and yield turpentine or other resinous material.

Fire-damp See Methane.

Fire-Fly a small winged insect of the *Elmidae* family, is able to draw out a strong phosphorescent light in the dark. There are some remarkably specimens in tropical countries.

Fire of London, of 1666, extended from East to West from the Tower to the Temple church and northward to Holborn Bridge. It broke out in a baker's shop in Pudding Lane and lasted four days and destroyed 87 churches, including St Paul's Cathedral and many public buildings among them the Royal Exchange, the Custom House, and the Guildhall. In the ruins were involved 10,000 houses and 400 streets. About 100,000 people were made homeless yet in about 10 years all the houses had been rebuilt. The plague had not disappeared from London when the fire occurred.

Firkin, a former measure of capacity, the fourth part of a barrel now only used in reference to a small cask or tub for butter, hard tallow, etc.

Fischer Tropech Process. A process for making synthetic petrol from carbon monoxide and hydrogen. The synthesis is accelerated by cobalt thoria and nickel thoria catalysts.

Fish Louse Parasitic crustaceans found on marine and fresh water fishes and whales.

Fission, Nuclear A nuclear reaction in which the nucleus of an atom (e.g. uranium 235, plutonium) captures a neutron, and the unstable nucleus so produced breaks into two nearly equal fragments and throws out several neutrons as well. In biology the term fission is applied to reproduction by fragmentation of a single-cell organism as in amoeba. See F12(1).

Flagella single hair-like projections found on many micro-organisms. Their sole function is by complicated motion, to move the organism about. They are longer and less versatile than cilia (q.v.).

Flag Officer a British naval officer who enjoys the right of carrying a flag at the mast-head of his ship and is of the rank of Admiral, Vice-Admiral, or Rear Admiral.

Flagship, the ship that flies the Admiral's flag, and from which all orders proceed.

Flamingo, a strangely beautiful, extremely slender wading bird of white and rose-pink plumage with long, slender legs and neck and a long down-curved bill with which it takes the mud and obtains its food of worms and molluscs. The wings are bright crimson, bordered with black, and a flock in flight is a picture of singular beauty. There is a large and famous colony in the Camargue.

Flash-Furnace. This is found by heating an oil in a special cup and taking the temperature at which sufficient vapour is produced to ignite when a small flame is applied. It is an index of the inflammability of oils.

Flea. Fleas are small parasitic insects belonging to the order *Aphaniptera* (so called because these creatures have no wings). They obtain their food by sucking blood from their host. They are laterally compressed, which immediately distinguishes them from lice. The human flea

(*Pulex irritans*) is able to jump vertically a distance of over 7 in.

Fleet Prison, a noted debtors prison that stood in Farningham Street London where the Congressional Memorial Hall now stands taking its name from the Fleet Ditch. Notorious for the cruelties inflicted on prisoners. It was pulled down in 1846.

Fleet Street a famous thoroughfare in London now the centre of journalism and newspaperdom though it was long celebrated for its taverns where the literary coteries of the day were wont to meet. It takes its name from the Fleet stream which used to run from Hampstead through Holborn to the Thames at Blackfriars.

Flemings the people of Flanders, whose ancestors of mediaeval times excelled in the textile arts. England owes its early eminence as a manufacturing nation to the migration of numbers of Flemings to this country in the 16th and 17th cent. See also Walloons.

Fleur de Lis, the former national emblem of France the flower of the lily. It was superseded by the Tricolour in 1789 but is still adhered to by the supporters of the old French royalties.

Flint consists of granular chalcodony with some opaline silica and occurs as nodules and bands in the Chalk. It is hard and has a conchoidal fracture so enabling it to be used in making cutting implements in prehistoric times. Before the invention of lucifer matches it was used along with steel for striking lights.

Flint implements are objects found in the younger geological strata, and constituting evidence of the condition and life of the period. They include knives, clubs, arrow heads, scrapers etc. used as weapons, tools and possibly as surgical instruments and in religious ceremonies. At the end of the Neolithic Period and the beginning of the Bronze Age a people using a new type of stone axe became evident in Europe advancing towards the south and central regions, and supposed by many to be the ancestors of the present European stock or Aryans. Similar to prehistoric specimens are the flint and obsidian implements of some of the primitive peoples of today. Ritual weapons and sacrificial knives continued to be made of stone long after the introduction of metals for practical purposes.

Flounder one of the most familiar of the smaller flat fishes common round the British coasts and seldom attaining a weight of over three pounds.

Fluorine, a chemical element member of the halogen family symbol F. It is found in combination with calcium in fluor spar and occurs in minute quantities in certain other minerals. Discovered by Scheele in 1771 it was first obtained by Moissan in 1886. A pale yellow gas it is very reactive and combines with most elements except oxygen. Its acid, hydrogen fluoride, etches glass the fluorine combining with the silicon to form volatile silicon fluoride. Organic fluorine compounds have found use as very stable polymers which resist a wide variety of chemical actions.

Fluorescent Lamp. See Electric Light and Ultra Violet Rays.

Fluor spar a mineral chemically calcium fluoride. Can be colourless green or yellow but is most commonly purple. Blue fluor spar under the name of Derbyshire blue John has been used for ornamental purposes.

Fly, the popular name for a large number of insects with one pair of wings and a proboscis terminating in a sucker through which fluid substances can be drawn up. The best known species are the common house-fly the blue-bottle, and the blow fly. In the larval form flies are maggots, and feed upon decaying substances, animal flesh, etc. Flies are able to walk upon ceilings or upright surfaces by having suckers at the soles of their feet. See Diptera.

Flycatcher name of a large family of small birds the Muscipalidae. They are insect feeders, catch their food in the air, and are distributed over most countries of the world. The spotted and the pied nest in Britain, which they visit from April to September.

Flying Fish are frequently to be seen in southern waters, and are capable of gliding considerable distances without touching the water. To

build up speed for its take off the fish swims rapidly to break the surface at 15-20 miles an hour. Maximum air speed is about 40 m.p.h.

Flying Fox a member of the bat family but of much larger size and confined to the tropical and sub tropical Old World. Like the bats it is nocturnal but it feeds entirely on fruits.

Flying Lemur See Colugo.

Flying Lizard or *Draco* an Asiatic lizard possessing wing like projections from each side which enable it to make flying leaps through the air though not sufficient for continuous flight.

Flying Saucers the name given to certain saucer like shapes which have on occasion been seen travelling through the atmosphere. For some time speculation was rife especially in America but it is now believed that when not hallucinations meteorological or cosmic ray balloons they are nothing more than atmospheric phenomena like mirages or mock suns caused by unusual atmospheric conditions. Described by Dr. Menzel, astrophysics professor at Harvard as real as rainbows are real and no more dangerous. It has been suggested that the study of some of the people who report the sighting of unidentified flying objects (UFOs) would be more rewarding than the investigation of what they saw. See also 120.

Flying Squirrel rodents of which there are several species in Europe Asia and America. It possesses a parachute like fold of skin by means of which it projects itself through the air. In appearance they are much like ordinary squirrels to which they are related. The African flying squirrels belong to a different family.

Fog is caused by the presence of particles of condensed water vapour or smoke in the surface layers of the atmosphere the term being applied meteorologically when the resulting obscurity is such as to render objects invisible at distances of up to 1 km. Fogs are frequently formed when the air near the ground is cooled below its dew point temperature by radiation on a still cloudless night by flowing over a relatively cold land or water mass or by mixing with a colder air stream. An accumulation of smoke over a large city may cause a high fog cutting off the daylight and producing gloom. See Pollution and also Aerosol.

Foliation, a geological term applied to rocks whose component minerals are arranged in parallel layers as the result of strong metamorphic action.

Folio a printing term for a sheet of paper folded once, a half sheet constituting a leaf.

Folklore concerns itself with the mental and spiritual life of the people—both civilised and primitive—as expressed in the traditional beliefs customs institutions and sayings that have been handed down from generation to generation by word of mouth and with the observation recording and interpretation of such traditions. (The word *folklore* itself was first suggested and used—as two words *Folk Lore*—by W. J. Thoms in the *Athenaeum* of August 22nd 1846 and was at once absorbed into the English language.) Traditional lore of the kind included in the term folklore takes many forms and ranges from omens of good and bad luck (spilling the salt breaking a mirror dropping an umbrella etc.) and the wearing of amulets or the possession of talismans (such as the horseshoe) as protection against misfortune to labor saving ceremonial dances such as the Abba Bromley Horn Dance the Hobby horses of Padstow and Minehead the Northern sword-dances, and the Christmas mummers plays. Especially important are the beliefs and customs associated with birth babyhood marriage and death such being occasions when the individuals concerned require special protection or when unusual happenings can be used for foretelling their future. The child born on a Sunday will be the luckiest rocking an empty cradle will ensure the speedy arrival of a new baby throwing an old shoe after a newly married couple brings them luck the bride should be carried over the threshold of the new home on the sea-coast death is believed to take place at the ebb-tide the bees must be told of the death of the master of the house, or they will leave the hive. Another very large section of the subject deals

with the traditional sayings and practices associated with particular days and seasons of the year—calendar customs, as they are called. The eating of pancakes on Shrove Tuesday, Mother Sunday customs and the simple cake Good Friday as the right day for planting potatoes, but emphatically the wrong day for washing clothes or cutting one's finger nails, the necessity of wearing something new on Easter Sunday, the children's maypole dances and May garlands, midsummer fires on Hallowe'en as the most favourable occasion for divining the future—especially in respect of marriage—and for games and sports such as apple bobbing, the numerous practices concerning the harvest. All these are examples of calendar customs, their full story would occupy several volumes. Folklorists are interested in all such oral tradition because they think that to a large extent it represents what folk have mentally stored up from the past and transmitted to their descendants throughout the centuries and because therefore it is able to assist other historic methods—ethnographical, linguistic, archaeological, etc.—in the elucidation of the early story of man. In those countries with a great diversity of peoples in all stages of culture, a knowledge of folklore and what it can teach of the mind of man is of great importance to administrators. The Folk Lore Society was founded in 1891 and that part of the subject represented by song and dance has now its own organisation in the English Folk Dance and Song Society.

Force as a term in physics signifies an influence or exertion which when made to act upon a body tends to move it if at rest or to affect or stop its progress if it be already in motion. In the cgs system the unit of force is the dyne, in the foot pound second system the poundal in the ft system the newton.

Formaldehyde Chemically it lies between methyl alcohol and formic acid, oxidation of methyl alcohol yields formaldehyde and oxidation of formaldehyde produces formic acid. It is used as a disinfectant in silvering mirrors and in the manufacture of phenol formaldehyde plastics (of which bakelite is the best known example). Solutions of formaldehyde in water formalin are used to preserve biological specimens.

Forme a body of letterpress type composed and secured for printing from, or a stereotype or electrotype. The former is used more for newspaper formes and the latter in good book work.

Formic Acid can be obtained from a colourless fluid secreted by ants and other insects and plants. It is a strong irritant. Commercially it is obtained from sodium formate which is synthesised by the absorption of carbon monoxide in caustic soda. It is used in the electroplating tanning and textile industries.

Formula, in mathematics and physics a statement of certain facts in symbolical form. In chemistry a representation of the composition of a compound.

Fossils, Remains of animals and plants, or direct evidence of their presence preserved in rocks. They include petrified skeletons and shells, leaf imprints, footprints, etc.

Four Freedoms a phrase coined by President Roosevelt in January, 1941 embodying what should be the goal of the Allies. They were (1) Freedom of speech and expression (2) Freedom of every person to worship God in his own way (3) Freedom from want (4) Freedom from fear.

Fox, carnivorous animal of the canine family found in considerable numbers in most parts of the world. The common fox *Vulpes vulpes* of Europe is a burrowing animal of nocturnal habits living upon birds, rabbits and domestic poultry in the capture of which it displays much cunning. The fox in Britain is preserved from extinction chiefly for hunting purposes. Among other notable species are the Arctic fox and the red fox of North America, of which the valuable silver fox, coveted for its fur is a variety.

Fox-Shark, or Thresher Shark, a large species of shark common in the Atlantic and in the Mediterranean. It is very destructive to small fish, but although it attains a length of 16 ft it is not dangerous to man.

Franciscans. See Friars.

Franco-German War (1870-71) was opened by a declaration of war by Napoleon III, but the Germans who were better prepared than the French won victory after victory. In September Napoleon and the whole French army were made prisoners at Sedan, a republic was proclaimed and Paris was besieged. The armistice was signed on 28 January 1871 and all part of Lorraine to Germany was ceded as a war indemnity of over 120 million francs.

Franklin a genus of birds closely related to the common partridge belonging to Africa. It includes the spur-legged partridge and the blue partridge which ranges from Syria to Asian. **Franklinia** is of two kinds, one being native to the island of Barbados and the other to the resinous exudation derived from fire and pine and largely used in pharmacy.

Franklin, the name given in feudal times to a country landowner who was independent of the territorial lord and performed many of the minor functions of local government while serving as magistrate.

Fresco a painting executed upon a wet wall or ceiling, a technique which has been used since the earliest times of civilisation and changed since it was practised in the early Renaissance art.

Freshwater Shrimp a small crustacean inhabiting British streams and feeding on dead fly or other decomposing matter. Although the shrimp like form it is not closely related to salt water shrimps. Its generic name is *Gammarus*.

Friars, members of certain mendicant orders of the Roman Catholic Church. The four chief orders are the Franciscans or Grey Friars, the Dominicans or Black Friars, the Carmelites or White Friars, and the Augustinians (Austin Friars).

Friday the 6th day of the week named after Frigg, the wife of Odin. It is the Mohammedan Sabbath, a general abstinence day in the Roman Catholic Church and according to popular superstition, an unlucky day.

Friends, The Society of Friends.

Frigate-Bird, a web-footed bird widely distributed over tropical latitudes and deriving its name from its great expanse of wing and forked tail resembling the shape of a swift vessel. It feeds on flying fish mostly being unable to dive and also steals from other birds. A frigate-bird was found dying on the Hebridean island of Tiree in July 1953, only twice previously had one been recorded in Europe—the first on the German coast in 1792 and the second on the coast of France in 1905.

Frog a familiar amphibian breathing through gills in the earlier (tadpole) part of its existence, and through lungs later. It remains three months in the tadpole stage. The frog hibernates underwater in the mud during the winter.

Frost occurs when the temperature falls to, or below 0°C., which is freezing point. Hoar frost is applied to the needles or feather-like crystals of ice deposited on the ground, in the same manner as dew. Glazed frost is the clear icy coating which may be formed as a result of rain falling on objects whose temperatures are below the freezing point. These layers of ice often rendering roads impassable for traffic, damaging overhead power and communication systems and endangering aircraft can also be caused by condensation from warm, damp winds coming into contact with very cold air and freezing surfaces.

Froth-Hopper or Frog-Hopper. A family of bug, (belonging to the insect order *Hemiptera*) which in the larval stage surround themselves with protective mass of froth (cuckoo spit). These insects which suck the sap of plants, bear a faint resemblance to frogs, and the adult possess great leaping powers.

Fuel Cells A recent development is a type of battery into which the active chemicals are fed from external fuel tanks. This is the *fuel cell* which is being developed in a number of versions in several countries. One was demonstrated in action when in 1959 Bacon of Cambridge University used his fuel cell to drive a fork lift truck and a welding machine. The Bacon fuel cell consists of two electrodes of porous nickel dipping into a solution of caustic potash in water. One electrode is supplied with

hydrogen gas from an outside cylinder and the other with oxygen. These gases forming layers on the nickel are the active chemicals. The oxygen combines with water to make two negatively charged ions each consisting of an oxygen and a hydrogen atom joined together (a hydroxyl ion). The hydroxyl ions travel through the solution to the hydrogen electrode where they combine with hydrogen to form neutral water. Their negative charge (one electron per ion involved) has now arrived at the hydrogen electrode and is ready to flow back to the other electrode through any outside circuit that is provided. This flow constitutes the useful electric current and it has been provided at the expense of creating water out of the original hydrogen and oxygen. The water can be removed in the form of steam. What is the advantage of all this? In the first place the fuel gases are easy to make and to store in cylinders. Supplying a new gas cylinder is easier and quicker than recharging an ordinary accumulator. Furthermore a fuel cell is lighter for a given power than an accumulator. Satellite designers have found them useful. The fuel cell is not damaged by heavy overloading and this is valuable for application to vehicle-driving. Fuel cell-driven buses could combine the advantages of diesel buses and trolleybuses. Fuel cells are still in the development stage. It is not certain how they will compete with combustion engines or in the oilless future with improved ordinary batteries.

Fulani a non-Negro people of Hamitic stock widely distributed in N.W. Africa chiefly in Nigeria. There are two main branches: the dark-skinned Fulani settled farmers and city dwellers, Moslem in religion; and the light-coloured Bororo who are semi-nomadic herdsmen. The Fulani are different from any tribe in W. Africa though they resemble in some ways the Massi of D. Africa. The Fulani conquered the Hausa states at the beginning of the 19th cent. which passed under British suzerainty after 1903. Sokoto built in 1810 was capital of the Fulani empire.

Fuller's Earth, a special kind of clay or marl possessing highly absorbent qualities originally used in the fulling—that is cleansing and felting—of cloth. Now used in clarifying oils. Deposits in America and in south of England.

Function In mathematics one quantity y is said to be a function of another quantity x written $y = f(x)$ if a change in x results in some corresponding change in y . Thus sine and log are functions of x . If y depends not only on x but on several other quantities as well y is called a function of many variables.

Functionalism, in architecture a movement originated by Le Corbusier. Swiss-born French architect and town planner who applied the austere principles of the Purist movement in painting to his own art. From about 1924 he designed in concrete steel and glass buildings in which every part had a significance in terms of function on the theory that objects created to carry out their particular function to perfection cannot help being beautiful. A house is a machine for living in. The style was in vogue between the two wars and although its severity became somewhat modified it is still the basis of most modern architecture.

Fungi, a class of simple plants, which reproduce from spores and lack the green colouring matter *chlorophyll*. It includes moulds, rusts, mildews, smuts, mushrooms, etc. Potato blight is a fungus disease which caused the failure of the potato crop in Ireland in 1840. 50 000 different fungi are known. See also F39(2) P8(1).

Furniture Beetle (*Anobium punctatum*). The common furniture beetle is responsible for 80 per cent of all woodworm damage and is the great pest of the comparatively modern house causing damage in the main to softwood roofing and flooring timbers. Adults one-eighth of an inch long. The grub tunnels for about 33 months. See also Woodworm, Death Watch Beetle.

Futurism, the only important modern art movement to arise outside France. Initiated by Marinetti, an Italian writer and mountebank friend of Mussolini at a later period. Its origin took the form of a manifesto published in Paris in 1909 in which Marinetti glorified violence,

war and the machine age. In its aggression it favoured the growth of fascism. One of the distinctive features of Futurist art was the use of the principle of simultaneity in which the same figure (e.g. a woman descending a flight of stairs) is represented in successive positions like film stills superimposed on each other. In spite of two further manifestos it was not until 1911 that the first examples of Futurist painting and sculpture appeared by the artists Severini, Balla and Boccioni. Apart from the principle of simultaneity Futurism derived from Cubist and Post-impressionist techniques. The movement faded out early in first world war.

G

Gabardine a long loose coarse overgarment worn by men of the common class in the Middle Ages, and prescribed by law as the distinctive garment of the Jews. The name is now given to a closely woven cloth of wool and cotton used to make raincoats.

Gabbro a kind of igneous rock often very coarse grained, containing a good deal of plagioclase feldspar and monoclinic pyroxene. It may occasionally also include biotite, magnetite, ilmenite and hornblende. A gabbro containing nickel at Sudbury in Canada is one of the richest sources known of that metal.

Gadfly a widely distributed family of flies with only one pair of wings including the horse fly. The females are very voracious, being able to bite through the skin and suck the blood of animals. The males are harmless.

Gadolinium An element belonging to the rare earths metals discovered in 1886 by M. Curie. It is strongly magnetic.

Gaelic relating to the Gaels and their language a term now applied only to the Celtic people inhabiting the Highlands of Scotland but formerly also to the Celts of Ireland and the Isle of Man. **Galah** a Bush Baboon related to the lemur native to Africa, large eyed in keeping with its nocturnal characteristics.

Galaxy or Milky Way Galaxy is the huge disk-shaped cloud of gas and stars (some 100 000 million one of which is the sun) that is turning in space like a great wheel with a diameter of about 100 000 light years. The Milky Way (that part of the heavens in Milton's words powdered with stars) is really only a small part of this disk and every star in the galaxy is moving round the centre under the gravitational control of the whole. The sun and planets lie near the edge of the disk, and it takes them about 250 million years to travel once round. The number of stars that can be seen with the unaided eye is about 3 000 and they all lie long to the Milky Way Galaxy as do most of the stars that can be seen with anything but the greatest telescopes. With the large modern optical and radar telescopes many other systems similar in size and weight to our galaxy have been discovered scattered more or less uniformly through space and the universe is said to include at least 10 000 million such galaxies. See also F3-6.

Gale a high wind now technically defined as one of at least Beaufort force 8. Between thirty and forty gales a year occur on the north and west coasts of the British Isles and only about half of this number in the south-east. At St Ann's Head, Pembroke the anemometer recorded a gust of 113 m.p.h. on Jan. 18 1945 which is a record for these islands. Gusts exceeding 70 m.p.h. are rarely experienced in London. Gale warnings are issued for specified areas by the Meteorological Office; the warnings taking the form of radio broadcasts and the hoisting of storm signals at certain points on the coast. See Beaufort Wind Scale Section N.

Gall, abnormal vegetable growths caused by insects, mites, bacteria or fungi found on all parts of the plant. Oak apples, Robin's pin cushion (on wild rose) witch's brooms (on trees) are examples. Some are useful commercially e.g. oak apples yield tannic acid and the black oak gall is used in America as animal food.

Galleon, the name given to the old three-decked Spanish treasure vessels employed in conveying the precious minerals from the American

colonies to Spain. The term is often applied to any large especially stately sailing vessel.
Galley an oar propelled sea boat used by the ancient Greeks and Romans for transport purposes manned by slaves. Boats of a similar class were used by the French down to the middle of the 18th cent. and manned by convicts.

Gallic Acid, obtained from gall nuts, sumach, tea, coffee and the seeds of the mango is used in the manufacture of inks and as an astringent in medicine. It was discovered by C W Scheele (1742-88) a Swedish chemist.

Gallium a white metal symbol Ga related to aluminium but which can be cut with a knife. It was discovered spectroscopically by L de Boscquaudran in 1875. Long before Mendeleev had predicted that an element with its properties would be found to fill the then existing gap in the Periodic Table this gap came immediately below aluminium so he suggested the name *eka aluminium* for it.

Gallup Poll a system introduced by Dr Gallup of the United States for testing public opinion on topical subjects by taking a test poll on questions framed to elicit opinions.

Galvanised Iron is iron coated with zinc. The name comes from the fact that such a coat protects against rust could be deposited electrolytically. Electrodeposition in some times used, but the cheaper and more common process depends on dipping the iron in a bath of molten zinc.

Gamboge a resinous gum obtained from the sap of *Garcinia morella* a tree native to Thailand, Cambodia and Ceylon and used as a yellow pigment in paints and also as a purgative.

Game is the term applied to wild animals which are protected from indiscriminate slaughter by Game Laws. In the United Kingdom game comprehends deer, hares, pheasants, partridges, grouse, black game, moor game, woodcocks, bustards and certain other birds and animals of the chase. Game can only be killed (with few exceptions) by persons holding game licences. Occupiers of land and one other person authorised by them in each case are allowed to kill hares and rabbits on their land without licence. Game cannot be sold except by a person holding a proper licence. There is a close time prescribed for the different classes of game, for instance the selling or exposing for sale of any hare or leveret during March, April, May, June or July is prohibited by law. Grouse cannot be shot between Dec 11 and Aug 11, partridges between Feb 2 and Aug 31, pheasants between Feb 2 and Sept 30 and black game between Dec 11 and Aug 10. In regard to foxes, stags and others custom and not Parliament prescribes a certain law which sportsmen rigidly adhere to. Game reserves are legally protected areas where natural vegetation and wild life are allowed to remain unmolested by sportsmen or those who might destroy for economic ends.

Gaming or Gambling—i.e. staking money on the chances of a game—differs from betting in that it depends upon the result of a trial of skill or a turn of chance. The Betting and Gaming Act of 1959 passed by the Macmillan administration replaced all the old laws on gaming which went back to an Act of 1541 entitled, 'An Acte for Mayntenance of Artyllane and debarringe of unlaful games' under which some games were unlawful if played for money in any circumstances. Roulette and any game of dice were among such games. Under the 1959 Act any game was lawful subject to certain conditions. Since then the Betting Gaming and Lotteries Act 1963 and the Gaming Act 1968 have been passed to deal with unlawful gaming and to prevent the exploitation of gaming by commercial interests. The playing of bingo is now restricted to clubs licensed for bingo only.

Gammexane a powerful insecticide used particularly to kill the tsetse fly and mosquito.

Gangue Useless minerals associated with metallic ores.

Gannet a fish eating bird which dives on its prey from a great height swallowing it under water. It is found in large numbers off the coast of Scotland and has breeding stations in the Hebrides, St. Kilda, Ailsa Craig, the Bass Rock, Grouseholm Island and on Ortoe and Les Etoes (rocks

off Alderney). It is a bird of white plumage, black tips to long narrow wings and wedge-shaped tail and weighs about 7 lb. The gannet breeds in colonies on ledges of steep rocky island cliffs. Related to the cormorants, pelicans and frigate birds.

Garden Cities in England were founded by Ebenezer Howard (1850-1928) and his ideas were put forward in his book *Tomorrow—A Peaceful Path to Real Reform* (later reissued as *Garden Cities of Tomorrow*). New towns should be so placed and planned as to get the best of town and country life, an adaptation of the model villages of certain industrial philanthropists such as Sir Richardson Cadbury, Levenshulme and Salt. The Garden City Association (later the Town and Country Planning Association) was formed in 1899 and the first garden city was begun at Letchworth in 1903 and successfully established. Welwyn Garden City was also Howard's foundation, established in 1919.

Gardener-Bird, a bird possessing many of the characteristics of the bower bird and found only in Papua-New Guinea. See also Bower Bird.

Gargantua, the giant hero of Rabelais' satire of immense eating and drinking capacity. Symbolises an antagonistic ideal of the greed of the Church.

Gargoyle a projecting spout for carrying off water from the roof gutter of a building. Gargoyles are only found in old structures; modern water pipe systems having rendered them unnecessary. In Gothic architecture they were turned to architectural account and made to take all kinds of grotesque forms—grinning goblins, hideous monsters, dragons and so forth.

Garlic a bulbous plant of the same genus as the onion and the leek, and a favourite condiment among the people of Southern Europe. It possesses a very strong odour and pungent taste and its culinary use is age-long.

Garnet a group of minerals, chemically they are orthosilicates of the metals calcium, magnesium, titanium, iron, aluminium. Garnets can be coloured yellow, brown, black, green or red. The blood red garnet is an important gem stone.

Garrote a method of strangulation used as capital punishment in Spain and consisting of a collar which is compressed by a screw that causes death by piercing the spinal marrow. Garroting was also applied to a system of highway robbery common in England in 1862-63, the assailants seizing their victims from behind, and by a sudden compression of the windpipe disabling them until the robbery was completed.

Garter The Most Noble Order of the Garter was founded (c. 1348) by King Edward III and is the premier order of knighthood in Great Britain. The traditional story associating the garter and the motto with the Countess of Salisbury who it was said dropped her garter while dancing with the King who remarked, 'Honi soit qui mal y pense' cannot be accepted. The order was originally limited to the Sovereign and 25 knights but the number has been extended, and it may now be bestowed on royal personages and leading representatives of the British peerage. The insignia of the order are the garter of dark blue velvet with the motto in letters of gold, the mantle of dark blue velvet lined with white silk, the surcoat and hood and the gold and enamel collar. The garter is worn on the left leg below the knee and by women as a sash over the left shoulder. See Knighthood.

Gas is an elastic fluid substance the molecules of which are in constant rapid motion and exerting pressure. The technique whereby gases are liquefied depends on increasing pressure and diminishing temperature. Each gas has a critical point unless the temperature is brought down to this point no amount of pressure will bring about liquefaction. Last gas to be liquefied was helium (1908) which boils at -269°C. See F17(1).

Gas from coal was first used as an illuminating agent by William Murdoch towards the end of the 18th cent. in Birmingham, and about 1807 was introduced in London, one side of Pall Mall being lighted with it. It became widely used as an illuminant and for space heating and cook-

ing In the United Kingdom there has been increasing attention paid to the possibility of using a primary fuel—natural gas—instead of producing gas from coal or oil. See Gas Natural Gas, Natural, natural mixture of gases often present with deposits of petroleum found issuing from the ground in many parts of the world—in the oilfields of Venezuela and the Caucasus in China Saudi Arabia but chiefly in North America Its chief component is methane Large industrial centres have made use of this gas since the latter part of the 19th cent but much of this valuable fuel still goes to waste Pipelines have been constructed to deliver the gas to where it is wanted Britain began to ship liquid methane from the Saharan oilfield in 1964 Some of the world's largest natural gas fields have recently been discovered in the North Sea and are being actively exploited Domestic gas appliances have to be modified if the natural product is substituted for ordinary town gas because the burning characteristics are different

Gas Turbine In this kind of engine mechanical movement is produced by a jet of gas impinging on a turbine wheel used in aeroplanes locomotives and ships These engines are mechanically simple compared with internal combustion engines and require less maintenance It has been stated that the jet propelled Comet cruises at 450 m.p.h. burning less than 1 lb of kerosene per passenger mile

Gauge a standard dimension or measurement applied in various branches of construction Thus, the standard railway gauge is 4 ft 8½ in. in the United Kingdom United States Canada France Germany Austria Holland Egypt Belgium Denmark Italy Hungary Sweden Switzerland and Turkey In India Ceylon and Spain the gauge is 5 ft 6 in. In Soviet Russia and Finland 5 ft Ireland 5 ft 3 in. Narrow railway gauges of different standards are in use on very steep inclines in various countries Other standard gauges are fixed in building and gun boring

Gauls were inhabitants of ancient Gaul the country which comprised what is now France Belgium, and parts of the Netherlands Switzerland and Germany

Gault, a stratum of blue clay between the Lower Greensand and the Chalk A typical section of the Gault can be seen at Folkestone

Gauss, a unit of magnetic induction in the c.g.s. system named after the great German mathematician and astronomer K. F. Gauss

Gavelkind, an old English custom of land tenure in Kent and other places in England whereby on the death, intestate of a property owner his property is divided equally among his children and not according to the law of primogeniture Abolished by the Law of Property Act 1922 and the Administration of Estates Act 1925

Gazelle, an animal of the antelope family of small and delicate shape with large eyes and short cylindrical horns It is of a fawn colour a native of North Africa and easily domesticated

Gecko the name of a family of drab lizards common in or near the tropics. They are nocturnal insectivorous and harmless

Geiger Counter an electrical device invented by Geiger which can detect individual atomic particles e.g. electrons protons etc. It often consists of a tube of gas at a few cm. Hg pressure fitted with two electrodes—a cylinder and an axial wire A high voltage is kept across the electrodes and the passage of a charged particle through the gas releases ions which permit a momentary discharge between the electrodes. Electronic circuits register this discharge as a count Geiger counters are widely used to detect and measure radioactivity and cosmic rays both for technical and research purposes.

Gelatine, a transparent tasteless, organic substance obtained from animal membranes bones, tendons etc. by boiling in water It is of various kinds according to the substance used in making it Isinglass, the purest form of it is made from air bladders and other membranes of fish, while the coarser kind—glue—is made from hoofs, skin, hides, etc. Its constituents are carbon, hydrogen, oxygen, and nitrogen. Gelatine is applied to an immense variety of

purposes, from the making of food jellies to photographic materials

Gemsbok, a large South African antelope with long straight horns and tufted tail. Light fawn in colour it has a black streak across its face and is very fleet of foot

General, a military title next in rank to that of Field Marshal the highest officer in the army Ranking below full General are Lieutenant General Major General and Brigadier

Generation a time measure reckoned at about 30 years when children are ready to replace parents also the body of persons existing at the same time or period

Generation Spontaneous See Abiogenesis

Genes the elementary units of heredity They exist as highly differentiated regions arranged along the length of the chromosomes which the nuclei of cells carry A chromosome may carry hundreds or even thousands of genes each with its own particular structure and specific properties The position of a particular gene on a chromosome is called its locus The material of the gene is DNA (qv) See Cell Division F30(2)

Genesis the first book of the Pentateuch compiled in the 5th cent. B.C. from earlier documents which carries the scriptural narrative from the creation to the death of Joseph Sometimes there is disagreement as in the story of the creation Gen 1 and 2. Gen 1 reflects the views of the ancient Greek scientist Thales (c. 640–546 B.C.) and may be said to be the first scientific account of the creation of the world The conditions described around the figures of Abraham Isaac Jacob and Joseph have a genuine historical basis

Genet, one of the smaller carnivorous animals about the size of a cat but with longer tail and spotted body It is a native of Southern Europe North Africa and Western Asia

Genetic Code The elucidation of the structure of DNA (qv) for which Crick Wilkins and Watson were jointly awarded the 1962 Nobel Prize for medicine revealed the code or chemical dictionary out of which messages serving as blueprints for living structures can be made See Protein synthesis F39(2)

Geneva Convention, an agreement made by the European Powers at Geneva in 1864 establishing humane regulations regarding the treatment of the sick and wounded in war and the status of those who minister to them All persons hospitals hospital ships are required to display the Geneva cross—a red cross on a white ground

A second conference held at Geneva in 1888 drew up a supplementary agreement An important result of this Convention was the establishment of the Red Cross Society in 1870

Genouillieres, ancient metal caps for covering the knees of an armed man an example may be seen on the Black Prince's monument in Canterbury Cathedral

Gentian the name for plants of the *Gentiana* genus many of which have intensely blue flowers The gentian root of *G. lutea* is used in pharmacy

Genus a term applied in biology to designate a group of similar species A group of similar genera is called a family

Geodesy the science of calculating the configuration and extent of the earth's surface and determining exact geographical positions and directions with variations of gravity etc. Land surveying is a branch of geodesy

Geography the science which describes the earth's surface its physical peculiarities and the distribution of the various animals and plants upon it It is usual to divide the subject into two main branches—physical geography which deals with the composition of the earth's surface and the distribution of its living occupants animate and inanimate and human geography which includes economic political and social geography

Geology, the science which deals with the condition and structure of the earth and the evidence afforded of ancient forms of life The geological strata are classified in the following categories *Primary* or *Palaeozoic* (the oldest fossil bearing rocks including the Cambrian Ordovician Silurian Devonian Carboniferous Permian) *Secondary* or *Mesozoic* (Triassic Jurassic Cretaceous), *Tertiary* or *Cenozoic*

(Eocene Oligocene Miocene Pliocene Pleistocene) *Post tertiary* (most recent rocks) See F44.

Geometrical Progression is a term used to indicate a succession of numbers which increase or decrease at an equal ratio—as 3 9 27 or 64 16 4.

Geometry is the branch of mathematics which demonstrates the properties of figures and the distances of points of space from each other by means of deductions. It is a science of reason from fundamental axioms and was perfected by Euclid about 300 B.C. The books of Euclid contain a full elucidation of the science though supplemented in modern times by Descartes, Newton and Carnot. Of recent years non-Euclidean geometry has been developed.

Geophysics the branches of physics which are concerned with the earth and its atmosphere. Meteorology geomagnetism aurora and air glow ionosphere solar activity cosmic rays glaciology oceanography seismology nuclear radiation in the atmosphere rockets and satellites—all these are geophysical subjects. The object of the International Geophysical Year 1957-58 was to investigate the physical phenomena occurring on and around the earth by means of carefully co-ordinated observations made simultaneously all over the globe.

George-Noble a gold ore so called from St. George and the dragon depicted on its obverse. First issued in the reign of Henry VIII.

German Silver an alloy of copper, zinc and nickel and used in the manufacture of table ware such as spoons forks etc.

Germanium A grey hard brittle chemical element symbol Ge chemically related to silicon and tin. Discovered by Winkler in 1886. Its richest ore is germanite containing 6% of the metal. Coal is also a relatively rich source. Since 1948 it has assumed great importance as a semi-conducting material for making transistor (*q.v.*). Because of this it has been so intensively studied that more is known about its physical properties than about those of any other element.

Gesta Romanorum (Latin = deeds of the Romans) a mediaeval collection of Latin stories of unknown authorship which circulated widely in Europe during the Middle Ages. First printed in the 15th cent. The stories were used by Chaucer Shakespeare and other writers who found many romantic incidents and legends which they were able to turn to good account.

Gestation the carrying of young in animals during pregnancy varies considerably in its length. In the case of an elephant the period is 21 months a camel 12 months a cow 9 months a cat 8 weeks a horse 48 weeks a dog 9 weeks and a pig 16 weeks. Hens sit for 21 days geese 30 swans 42 turkeys 28 pigeons 18.

Geysers hot springs of volcanic origin and action are remarkable for the fact that they throw out huge streams of boiling water in stead of lava as in the case of a volcano. The most famous geysers are those of Iceland which number over a hundred, the principal one having an opening 70 ft. in diameter and discharging a column of water to a height of 200 ft. There are also geysers in the Yellowstone region of America and some in New Zealand. Also a device now in common domestic use for heating running water quickly by gas or electricity.

Ghost-Moth or Ghost-Swift an interesting nocturnal insect (*Hepatus humilis*) common in England possessing in the male a white collar and known for its habit of hovering with a pendulum like action in the twilight over a particular spot where the female is concealed. **Glambeaux** metal armour for the legs and shins worn by the warriors of Richard II. a reign.

Gibbon the name of a long armed ape mainly inhabiting S.E. Asia. It is without tail and possesses the power of very rapid movement among the trees of the forests.

Gin a well known spirit distilled from malt or barley and flavoured with the juniper berry. The principal varieties are the English and American, known as Gin or Dry Gin and the Dutch, referred to as jenever or Hollandse jenever. In Germany and Austria it is called "Schnapps". The word Gin is an ab-

breivation of Geneva both being primarily derived from the French *genèvre* (juniper).

Ginger is obtained from a reed like perennial plant grown in tropical countries. There are two varieties black ginger and grey ginger. The former is obtained by peeling and drying the root the latter by scalding and drying. Ginger is largely used as a condiment.

Giraffe the tallest of existing animals reaching a height of from 18 to 20 ft. when full grown. Its sloping back and elongated neck seem to be the natural evolution of an animal that has to feed on the branches of trees. It is a native of Africa, is of a light fawn colour marked with darker spots and has a prehensile tongue.

Giralda a beautiful and remarkable example of Arabian art erected in 1195 at Seville still in existence. Minarets similar to the Giralda are to be found at Morocco Tunis and Tetuan.

Glaciers form in the higher Alpine ranges, and are immense consolidated masses of snow which are gradually impelled by their force down the mountain sides until they reach a point where the temperature causes them to melt and they run off in streams. From such glaciers the five great rivers the Rhine the Po the Rhône the Inn and the Adige have their source. The longest of the Swiss glaciers is the Gross Aletsch which some extend over 10 miles. Some of the glaciers of the Himalayas are four times as long. The Mur in Alaska is of enormous magnitude and that of Jostedal in Norway is the largest in Europe.

Gladiators were professional athletes and combatants in ancient Rome contesting with each other or with wild beasts. At first they were drawn from the slave and prisoner classes exclusively but so much were the successful gladiators held in esteem that men came to make a profession of athletics and gladiatorial training schools were established. When a gladiator was vanquished without being killed in combat it was left with the spectators to decide his fate, death being voted by holding the hands out with the thumb turned inward and life by putting forth the hands with the thumb extended. Gladiatorial shows were the chief public displays in Rome from the 3rd to the 4th cent. A.D.

Glass a substance obtained from the fusion of silica (sand) with various bases and is more or less transparent. There are numerous kinds of glass but they group themselves under one or other of the following classifications—Flint glass or crystal whose components are potash, silica and oxide of lead window glass, made from soda lime and silica Bohemian glass containing potash lime and silica and bottle glass composed of soda lime alumina silica and oxide of iron. Heat proof glasses used for making cooking utensils contain boron. Glass was made by the Phoenicians and was familiar in ancient Egypt. The Egyptians introduced it into Rome. In the Middle Ages Venice was famed for its glass manufactures but after the 17th cent. Bohemia acquired pre-eminence. English glass reached its highest level of artistic design in the 17th and 18th cent. Window glass was not used in this country for dwellings until the end of the Middle Ages.

Glass-Snake genus *Ophisaurus* of legless lizards with long fragile tails capable of regeneration when broken. Six species are known in S.E. Europe S.W. Asia, Indo-China and N. America. Attains a length of about 2 ft. main colouring green, with black and yellow markings.

Glauconite A green mineral chemically a hydrated silicate of potassium and iron. Commonly found in marine sands (hence these rocks are known as greensands) and sandstones.

Glaucus is a curious genus of sea slugs often called the Sea Lizard belonging to the molluscs. It is without shell and has a soft body with horny mouth and four tentacles. It is a native of the Atlantic, and is not more than 12 in. in length. Glee, an unaccompanied piece for three or more voices. Glee singing was popular in England during the 18th and early 19th cent and gleecules are still in existence.

Globigerina an oceanic unicellular animalcule with a perforated shell and occurring in certain parts of the Atlantic in such vast numbers as to form a bed of chalk ooze with their empty shells.

Glöckenspiel, an instrument composed of metal bars each of which is tuned to a note. The bars are struck by hand hammers and give forth chiming sounds.

Gloria in Excelsis (Glory to God in the highest) is the opening of the Latin hymn adapted from Luke II 4 and the most prominent hymn of the ecclesiastical rites in the Christian liturgies.

Gloria Patri, the lesser Doxology with which chants are generally concluded in the English Church service—Glory be to the Father and to the Son.

Glow-worm a beetle possessing the power (much stronger in the female than the male) of emitting phosphorescent light from the hind end of the body. The female is wingless.

Glucinium. See Beryllium.

Glucose Dextrose or Grape Sugar is a carbohydrate (qv). It is produced by hydrolysis from cane sugar, dextrine, starch, cellulose etc. by the action of reagents. It also occurs in many plants, fruits and honey. For brewing purposes glucose is prepared by the conversion of starch by sulphuric acid. Malt also converts starch into glucose.

Glutton or Wolverine the biggest animal of the weasel family inhabits the northernmost parts of Europe and America. In build it resembles the bear and is rather larger than a badger. Its fur is of a brown black hue but coarse.

Glycerine or Glycerol, occurs in natural fats combined with fatty acids and is obtained by decomposing those substances with alkalis or by superheated steam. It is colourless and oily and sweet and is put to a variety of commercial uses being widely utilised for medicaments for lubricating purposes, and in the manufacture of nitro glycerine.

Glycols Organic compounds containing two alcohol groups. Ethylene glycol is the most widely known example. It is used as an anti-freeze in motor car radiators on account of its property of greatly reducing the freezing point of water. Also used in the manufacture of Terylene. See Esters.

Glyptodon, an extinct species of gigantic armadillo fossil remains of which have been discovered in S. America. It was some 9 ft long, carried a huge tortoise-like shell and had fluted teeth.

Gneiss a metamorphic rock usually containing quartz, felspar and mica. It is banded the light-coloured minerals being concentrated apart from the dark minerals.

Gnosticism. See J22.

Gnu, an animal in the antelope family combining the characteristics of the buffalo in its head and horns the ass in its neck and mane and the horse in its long and bushy tail. There are two species, the common and the brindled, and they are about the size of an ass. They abound in Africa and congregate in herds.

Goat-Moth (*Gossus cossus*) a large moth of the *Cossidae* family common in Britain, evil smelling and very destructive in the larval stage to trees of the poplar and willow genus into the wood of which the caterpillar bores during its three years' period of development.

Goats are horned ruminant quadrupeds, indigenous to the Eastern Hemisphere but now domesticated in all parts of the world. Though related to the sheep they are a much harder and more active animal. The male has a tuft of hair under the chin. Many species, including those of Cashmere and Angora, are valuable for their hair which is used for fine textile fabrics. The milk of the goat is nutritive and goat-skins are in good demand for leather for gloves, shoes, etc.

Gobelins Tapestry was originated by a family of dyers named Gobelins in the 15th cent. in Paris. The Gobelins establishment, which produced this beautiful tapestry made of silk and wool or silk and cotton, was taken over by the Government of Louis XIV in 1662, and since then has been the French national factory for that class of fabric.

God and Man. See J22.

Gog and Magog two legendary City of London giants, supposed to be the offspring of certain wicked daughters of the Emperor Diocletian and a band of demons. They were brought captive to London and made to serve as prisoners at the

Palace of Brute which stood on the site of Guildhall. Effigies of the giants have stood in Guildhall since the time of Henry V. They were destroyed in the Great Fire of 1666, replaced in 1872 and used to be carried through the streets of London in the Lord Mayors' Show. The present figures newly carved in lime wood by Mr David Evans, replaced those carved in 1703 by Richard Saunders which were destroyed in an air raid during the last war.

Gold Metallic element symbol Au (Latin *Aurum*) related to silver and copper the coinage metals. The greatest amount of gold is obtained by treating gold-bearing quartz by the cyanide process. The gold is dissolved out by cyanide solution, which is then run into long boxes filled with zinc shavings when the gold is precipitated as a black slime. This is melted with an oxidising agent which removes the zinc. **Gold Beaters' Skin** is the outside membrane of the large intestine of the ox specially prepared and used by gold beaters for placing between the leaves of gold while they beat them. This membrane is of great tenacity and gets beaten to such extreme thinness that it is used to put on cuts and bruises.

Gold Standard. Under the gold standard system which was widely prevalent up to 1914 each gold standard country fixed the value of its currency in terms of a weight of gold of a certain fineness and was broadly speaking ready to exchange its currency freely for gold which could then be exported without restriction. This involved keeping a gold reserve big enough to meet all likely demands and also to serve as a backing for the issue of notes. The gold standard had to be given up during the First World War and though it was in substance restored in Great Britain in 1925 (when Churchill was Chancellor) the restoration was never complete as the gold reserve remained too small for complete freedom to export to be practicable. Sterling had to be devalued in the financial crisis of 1931 (which brought about the fall of the Labour Government) and Great Britain was forced off the gold standard. Most of the currencies important in world trade and payments are now convertible. The monetary crisis of March 1968 led to the present two-tier gold price system. See Section G Part IV.

Goldeneye, a species of wild duck widely distributed over Arctic regions. It is a passage migrant and winter visitor to the British Isles. Has nested in Cheshire. Distinguished by a large white spot in front of each eye on a dark ground.

Golden Number the number of any year in the metonic cycle of 19 years, deriving its name from the fact that in the old calendars it was always printed in gold. It is found by adding 1 to the number of the year A.D. and dividing by 19 the remainder being the Golden Number or if no remainder the Golden Number is 19. The only use to which the Golden Number is put now is in making ecclesiastical calculations for determining movable feasts.

Goldsmiths Company, one of the richest London City Companies the official assayers of gold and silver invested with the power of hall marking the quality of objects made from these metals. First charter granted in 1327.

Gondola the old regulation black boats so common on the canals of Venice, propelled by a gondolier with one oar who stands at the stern, his passengers being accommodated in a covered space in the centre.

Gonfalon, the pennon affixed to a lance spear or standard, consisting usually of two or three streamers, and made to turn like a weathercock.

Gophers, Rodent mammals. The pocket gophers are stout-bodied burrowers common in the U.S.A. The slender burrowing gophers, also called ground squirrels, occur in central and western U.S.A. The shrew or muskrat is a related European species. They are a great pest among grain crops.

Gordon Riots of 1780 were an anti popery agitation fomented by Lord George Gordon. Called also No Popery Riots.

Gorilla, the largest of the anthropoid apes, found in the forests of Equatorial Africa, and at maturity standing from 4 to 5 ft high.

Goshawk (*Accipiter gentilis*) a diurnal bird of prey

fearless and extremely agile loves wooded country and is very destructive of poultry and game birds. It resembles the peregrine falcon in appearance but has shorter rounded wings. This bird was a great favourite of falconers in medieval times.

Gospels are those portions of the New Testament which deal with the life, death, resurrection and teachings of Christ. They are the gospels of Matthew, Mark, Luke and John all compiled in the latter part of the 1st cent. The first three are called the *synoptic gospels* because of their general unity of narrative. Mark was the first to be written and John the last, and it is to Mark that one should turn for the most reliable source of knowledge of the life of Jesus. The word *gospel* comes from two Anglo-Saxon words *gode* (good) and *spell* (tidings), a translation of the Greek *euangelion* = evangel, evangelist.

Gothic A term applied to a style of architecture which followed the Romanesque, appeared in France during the 12th cent. and is typical of northern Europe. It was not generally appreciated south of the Alps. The high and sharply pointed arches, the walls supported outside by flying buttresses, the tracered windows often filled with stained glass and the lofty spires are in sharp distinction to the semicircular arches and the massive walls characteristic of the more sturdy Romanesque style. Yet the transition was gradual. The cathedrals of Chartres, Laon and the Benedictine church of St. Denis just outside Paris are typical of early Gothic. The style found its full expression in the French cathedrals of the 13th and 14th cent. Reims, Notre Dame, Beaulieu, Bourges and Amiens. From France the style spread to other lands in each of which it developed its own characteristics, thus the English churches tended to have massive towers and delicate spires and as at Salisbury were often set in open grounds surrounded by lawns. Flemish and Dutch churches were sometimes built of brick as were those in north Germany and Scandinavia. In Spain the Flamboyant style was followed. The main Gothic cathedral in Italy—that of Milan—although begun in 1386 was not completed until the early 19th cent. The lofty character of Gothic has been attributed by the romantic to pious aspiration as if the spires were striving towards heaven and this concept may well have played a part. The more concrete reasons however were somewhat different. Romanesque churches were thick-walled, sturdy, small, windowed and set often in open country or on heights (a) because architects had not yet discovered how to support a heavy roof without massive walls and (b) because being built in dangerous times they had a defensive function. Gothic churches began to be raised in less troublesome times and were tall for the same reason that New York skyscrapers are tall (i.e. the increasing price of land). Also they were built in growing cities where not much space was available and they were lavish in style because wealth was increasing and rich merchants were willing to contribute. Late English Gothic is seen, for example at King's College Chapel, Cambridge, Henry's Chapel at Westminster and St. George's Chapel at Windsor (all c. 1500). Gothic is also found in secular buildings, e.g. Little Wenham Hall in Suffolk, the castle at Ghent, the town halls of Louvain and Middelburg and the streets of Gothic houses in Bruges still in use today. Virtually Gothic as a style (excluding the Gothic revival of 19th cent. England) ended at the close of the 15th cent. Gothic art is best seen in the illuminated manuscripts of the 13th and 14th cent. and in the church sculpture. Its characteristic is a complete departure from the cool, perfectionist realism of classical times with distortion to produce emotional effects. The human figures are not ideal forms but recognisable as people we might meet in the street, yet there was also the element of wild imagination, intricate design and a wealth of feelings which might be grotesque, humorous, macabre, or even obscene. This element of distortion and sometimes wildly unrealistic colouring which produced an effect more dramatic than the literal representa-

tion of the classic schools remained an important element in German art (see Expressionism) right up to modern times.

Goths A Teutonic people who originally came from southern Sweden (Gotland) and by the 3rd cent. were settled in the region north of the Black Sea. They began to encroach on the Roman Empire and early in the 4th cent. split into two divisions, the wise Goths or Visigoths between the Danube and the Dniester (referred to as the West Goths) and the bright Goths or Ostrogoths in southern Russia on the Dniester (referred to as the East Goths). The Ostrogoths were conquered by the Huns c. 370 while the Visigoths under Alaric devastated Greece and sacked Rome in 410. Eventually the Visigoths spread to France and Spain and their last king, Roderick, fell in battle against the Moors in 711. The Ostrogoths regained their independence on the death of Attila in 453 and under their king Theodoric the Great conquered Italy in 488. They lost their identity after Justinian regained Italy 525-552.

Gourd Family or Cucurbitaceae. This family of about 650 species of flowering plants includes the gourds, pumpkins, cantaloupes, cucumbers, gherkins, watermelon and squashes. Most abundant in the tropics, the cucurbits are mainly climbing annuals with very rapid growth. The bath room loofah is the skeleton of one cucurbit fruit, *Luffa cylindrica*. The squaring cucumber is another member of the family.

Governor A device attached to an engine turbine compressor etc. which automatically controls the engine speed in accordance with power demand. Most governors depend upon the centrifugal action of two or more balls which are thrown outwards as their speed of rotation increases and actuate a throttle valve or cut off. The centrifugal governor was invented by Thomas Mead patented by him in 1787 and used on windmills. Watt adapted it to the steam engine.

Grail Legend of the Holy Grail, a tale of Celtic origin which became part of Arthurian legend and the subject of many medieval quest romances. According to the Christian version the grail was the cup which Christ used at the Last Supper, brought to England by St. Joseph of Arimathea.

Grand Prix, the French Derby, was established by Napoleon III in 1863. It is the chief French race and is an international competition of three year olds.

Granite is a coarsely crystalline igneous rock consisting of quartz and alkali feldspars plus mica or hornblende. It is a much used ornamental and building stone. It forms the high ground of Dartmoor and Bodmin Moor.

Graphite or Plumbago commonly called black lead is a form of carbon occurring in foliated masses in marble schist etc. It is soft and will make black marks on paper or other plain surfaces and is mainly used for lead pencils. It is also a valuable lubricant. Pure graphite has found a new use with the construction of atomic piles. Important deposits occur in Siberia, Ceylon, Madagascar, Canada and the U.S.A.

Graptolites, fossil animals confined to Cambrian, Ordovician and Silurian strata. Once classified as hydrazoa but now considered more likely to be hemichordates.

Grasshopper There are many species of these leaping insects which are related to the locusts and crickets. Most are vegetarians, some eat flies and caterpillars also. The chirping sound they make is made by scraping the hind legs against the wings in some species a noise is produced by rubbing the wings together.

Gravitation. One of the four types of force known to physics. The others are electromagnetic forces and two types of nuclear force (F15(2)). Gravitational forces are an attraction that one piece of matter has for another, they dominate astronomical phenomena, but inside the atom they are negligible compared with the other three types of force. Einstein's General Theory of Relativity is the only theory at present extant which attempts to interpret gravitational forces in terms of more fundamental concepts. See F15(2).

Graying the ordinary wild grey goose of Europe, the species from which domestic geese are derived frequents fens and marshes, breeds

in Iceland Scandinavia and Scotland distinguished by pinkish legs and feet and lack of black markings on bill

Graying a fresh water fish of the salmon family having a large dorsal fin and averaging about 1 lb in weight

Grebe a diving bird of beautiful plumage found over a great part of the world on lakes and oceans The two species familiar in Great Britain are the Dabchick or Little Grebe and the large and handsome Great Crested Grebe which has a feathery tuft lost in the autumn on each side of the head Grebes have remarkable courtship displays The breast feathers are of a downy softness and silver lustre for which they were formerly much hunted

Greek Art See Hellenic Art.

Greek Fire a combustible supposed to have been composed of sulphur nitre naphtha and asphalt used with destructive effect by the Greeks of the Eastern Empire in their wars

Greek Kalends equivalent to never as only the Romans not the Greeks had kalends

Green Revolution The green revolution is principally due to the American agricultural expert Dr Norman Borlaug who since the 1940s has been working in Mexico on the development of new improved strains of wheat rice maize and other cereals The application of new plant varieties has transformed the agricultural prospects of India Pakistan Ceylon Mexico the Philippines and other under developed countries Food importers are turning into exporters For his pioneering work Dr Borlaug was awarded the 1970 Nobel peace prize

Greenwich Mean Time The first Nautical Almanac for the use of navigators and astronomers was published by the Astronomer Royal in 1767 It was based on the meridian at Greenwich with longitude measured east and west of 0 A master clock which still exists was built at Greenwich Observatory in 1832 to control the railway station clocks and Greenwich Mean Time or Railway Time as it was sometimes called prevailed In 1884 Greenwich was chosen as the prime meridian of the world and GMT became known as Universal Time See also British Standard Time

Gregorian Calendar See Calendar

Gregorian Chant ritual music with a system of harmony suitable for church use First established by Pope Gregory I.

Gresham's Law states that if good money is money with the higher intrinsic value and bad money are in circulation together the bad money will tend to drive out the good money from circulation. For instance the good money is more likely to be melted down or demanded in payment by foreign creditors.

Gretna Green, a celebrated village in Dumfries just over the border from England, where runaway marriages were performed from 1754 to 1856 though only completely stopped during present century

Griffin in ancient mythology a winged creature with an eagle's head and the body of a lion found in ancient sculptures of Persia and Assyria Its origin is traced to the Hittites

Grilse a young salmon that has only been once to the sea

Grimm's Law formulated by Jacob Grimm, an eminent German philologist lays down a principle of consonantal change in the Germanic languages For instance *Lat pater Eng father Ger Vater Lat frater Eng brother Ger Bruder Lat decem Eng ten Ger zehn*

Gramm (French = *gros grain*) a kind of rough fabric made of wool and some other fibre such as silk, mohair or cotton formerly much used for commoner kinds of wearing apparel.

Grotto, a natural or artificial cave. Among the most famous are the blue grotto of Capri and the stalactite grotto of Antiparos (Cyclades Aegean)

Ground Wave, that part of the energy emitted by a radio transmitter which travels along the ground as opposed to the sky wave which is reflected back to earth by the ionosphere With the lower radio-frequencies, the ground wave can be picked up over several thousand miles, in the broadcasting band over a hundred or so miles it is virtually useless at high frequencies.

Grouse, game bird of the northern latitudes where

some 20 species occur They are stout compact ground dwelling birds protectively plumaged (the willow grouse turns white in winter) the male usually being larger and more brightly coloured than the female The red grouse of the British moorlands has been introduced into Belgium and W Germany Of the same family are the blackcock ptarmigan capercaillie American prairie hen and the common partridge Grouse shooting begins in Britain on Aug 12

Guanaco a large species of llama common to South America and utilised as a beast of burden

Guano the excrement of sea birds found in large quantities on the rocky islands of the western coasts of South America and Nauru It forms a useful fertilising agent being rich in phosphate and ammonia and first came into use in 1841 since which time Peruvian guano has been a recognised article of commerce Beds of guano from 50 to 60 ft in thickness are not uncommon Fish guano and bat guano from caves in South America and the Bahamas are also used as fertilisers

Gudgeon, a small fresh water fish of the carp family with 2 small barbels on the upper lip

Guelph and **Ghibelline** Italianised forms of the German words *Welf* and *Waiblingen* the names of two rival princely families whose conflicts made much of the history of Germany and Italy during the Middle Ages The feuds between these two factions continued in Italy during the campaigns of Emperor Frederick I and later developed into the fierce struggles of the 13th cent between emperor and pope In Italy the Ghibellines supported the side of the German emperors and the Guelphs the cause of the pope The present Royal Family of England is descended from the Guelphs through the ducal House of Brunswick (the name of Windsor was assumed during the first world war)

Guildhall, the place of assembly of the members of a guild and at one time when guilds were in full strength was practically the Town Hall The London Guildhall is to day the hall of meeting for the City of London Corporation

Guilds for the fostering and protection of various trades have existed in England since Anglo Saxon times and from the 12th to the 16th cent exercised great influence and enjoyed many privileges There were trades guilds and craftsmen's guilds and in all large cities and towns there was a guild hall Their successes in the Middle Ages led to many monopolistic abuses and in the end it became necessary to free the country from their restrictive power The City Guilds (Livery Companies of the City of London) derive their name from the distinctive dress assumed by their members in the 14th cent There are 88 Guilds in existence

Guild Socialism See J24.

Guillemot a genus of sea birds of the auk family common in Northern Europe two species—the Common Guillemot and the Black Guillemot—being natives of our own sea coasts nesting on the cliffs Brinnich's Guillemot, an Arctic species is a rare straggler in the British Isles

Guinea, an English gold coin of the value of twenty-one shillings current from 1663 to 1817 and deriving its name from the first guinea coin age having been struck from gold obtained on the coast of Guinea.

Guinea-Pig a rodent of the cavy family about 10 in. in length and with a tail so short that it does not project outside the body It makes an excellent pet though easily frightened. Its ancestors were species of the wild cavy of S America said to have been domesticated by the Incas of Peru See Z15(2)

Gules a heraldic tint, denoting a rose of red tincture indicated by vertical lines drawn of engraved without colour

Gulf Stream is confined entirely to the western side of the N Atlantic and is the warm water current flowing through the Straits of Florida from the Gulf of Mexico parallel to the American coast up as far as Cape Hatteras From there it continues north-eastwards as a slower broader cooler (yet even so relatively warm) drift of water merging with the North Atlantic Drift and losing its identity about 40° N Lat 60° W Long It is a common error to attribute the

warmth of the British Isles and Western Europe generally to the Gulf Stream but this has no influence whatever except in so far as it feeds the North Atlantic Drift. Both the Gulf Stream and the North Atlantic Drift owe their movement to the direction of the prevailing winds and it is the south westerly winds coming from warmer regions and passing over the surface waters of the Atlantic Drift that brings the warmth inland to influence the climate of Western Europe.

Gull An extremely well known long winged sea bird with rather short legs and webbed feet. In almost all adults the body and tail are white whilst the back and most of the wings are grey or black. In the majority of cases the plumage of juveniles is partly or entirely dusky. Gulls are omnivorous and are very useful as scavengers. They follow ships and quickly seize upon any refuse which may be thrown overboard. There are 44 species which vary in size from moderately small to large. With certain exceptions such as the Kittiwake in the North Atlantic they are not found very far from land. They are sociable and mostly breed in colonies on cliff ledges on islands beaches and sandhills and among vegetation in swamps sometimes a long way from the sea. The nest is usually substantial and the eggs generally number from two to three. Of the 29 species breeding in the northern hemisphere 14 occur in the British Isles. The pure white Ivory Gull is the most northerly of birds. Sabine's and the Swallow tailed Gull have forked tails. Ross's Gull has a black ring round the neck and one species Franklin's Gull migrates from the North where it breeds to pass the winter in the Southern hemisphere.

Gums are glutinous compounds obtained from vegetable sources soluble in cold or hot water but not in alcohol. There are innumerable varieties. Gum Arabic is exuded from a species of acacia grown in Senegal the Sudan Arabia India and other countries and is a valuable commercial product used in dyes ink making as a vehicle and in medicine. India rubber is an elastic gum. Gums are also made from starch potatoes wheat etc. from seeds bark roots and weeds. Many so-called gums are resins.

Gun-Cotton a powerful explosive manufactured by subjecting a prepared cotton to the prolonged action of a mixture of three parts sulphuric acid and one part of nitric acid. It burns without explosion on ignition but by percussion explodes with a force five times greater than that of gunpowder.

Gunpowder also called black powder the oldest of explosive mixtures consists of salt petre sulphur and charcoal intimately mixed the proportions being varied for different intended uses.

Gunpowder Plot was a conspiracy by a desperate band of Roman Catholics in the reign of James I to avenge the harsh treatment to which Catholics were subjected. Barrels of gunpowder were secreted in the vaults underneath the Houses of Parliament and it was proposed to fire these when the King and his Ministers assembled on Nov. 5 1605. The plot was betrayed and Guy Fawkes and his co-conspirators were arrested and executed. The date serves to perpetuate the ancient custom of burning the effigy of Fawkes a custom in which young people are the most enthusiastic participants with bonfire fireworks etc.

Gurnard a sea-fish with large bony head and diminutive body of which there are some forty species. They are plentiful in British waters.

Gymnasium originally the name given in ancient Greece to the public places where Greek youth used to exercise and receive instruction. Plato Aristotle and other great teachers lectured there. The Greek institution was never very popular with the Romans and it was not until the 18th and 19th cent. that the cult of combining physical with intellectual activity again found a place in educational systems. In Germany the name was applied to the classical grammar school in this country and America to the halls where gymnastics were practised.

Gypsies a nomadic race believed to be of Indian origin. Their language Romany is related to

the languages of N.W. India. They are spread over many parts of the world but are most common in Europe where they appeared towards the end of the Middle Ages. The English name *gypsy* comes from the Spanish *gitano* = Egyptian. Other European names are *Zigeuner* (Ger.) *zingaro* (It.) *tanavny* (Magyar) all resembling the Persian *zangar* = a saddler. Their history has been one of persecution. Hitler treated them like the Jews. In Britain since the war they have been kept increasingly on the move but in 1968 Parliament passed a Bill to make the provisions of sites a duty of local authorities. The Netherlands passed a similar Bill in 1918. It is now more usual to speak of gypsies as travellers. Economic pressure has largely removed their traditional crafts of tinkering basket making peg making. The majority now deal in scrap iron paper and rag.

Gypsum a whitish mineral consisting of hydrated sulphate of calcium. The finest gypsum is alabaster. When heated gypsum is converted into the powder called Plaster of Paris. The water it loses can be taken up when the plaster is wetted and the reconversion of Plaster of Paris into gypsum accounts for the way in which the former sets hard. The name

Plaster of Paris came from the location of important gypsum quarries in the Montmartre district of Paris. It was found after the flood disasters of Jan. 1953 that gypsum could under the effect of sea water. By spreading it for the rain to wash into the soil thousands of acres of farmland in Holland and Britain were made productive again.

Gyroscope is a symmetrical rapidly rotating object typically wheel like which because of its mass and rotation possesses a lot of the dynamical property known as angular momentum. Basic dynamical laws tell us that angular momentum is conserved and a consequence of this is that the axis of rotation tends to stay pointing in the same direction. Disturbing influences make a gyroscope's motion complicated but the general effect of the presence of a gyroscope attached to any body is to help to stabilise the body's motion. This is made use of in reducing the rocking of ships and in compasses and control systems in aircraft torpedoes and missiles.

H

Habeas Corpus the name given to a writ ordering the body of a person under restraint or imprisonment to be brought into court for full inquiry into the legality of the restraint to be made. The first Habeas Corpus Act was passed in 1679 though nominally such a right had existed from Magna Carta but some of the more despotic kings had disregarded it. In times of public peril the privilege of *habeas corpus* is sometimes temporarily suspended many instances occurring in the history of Ireland and during the First and Second World Wars.

Haber Process the important industrial process for synthesising ammonia from atmospheric nitrogen. Nitrogen and hydrogen are made to combine at high pressure (200 atmospheres or upwards) in an electric arc.

Haddock one of the best known fishes abounding in northern seas and averaging about 4 lb in weight. Related to the cod. Largely used for curing and sold as finnan haddies.

Hade of veins a mining term indicating the particular inclination that any vein seam or strata may have from the perpendicular. Thus in Weardale the veins mainly hade to the north.

Hadrian's Wall See Roman Walls.

Haematite ferric oxide one of the principal iron ores containing about 70% of the metal. It is usually found in kidney-shaped masses and is specular red or brown in thin fragments but greyish in bulk.

Haemocyanin the respiratory pigment of crustaceans and molluscs. It functions like haemoglobin, from which it differs in containing copper instead of iron and being blue when oxidised instead of red. See F36(2).

Haemoglobin the pigment containing iron which gives red blood corpuscles their colour. It is a respiratory pigment having the property of picking up oxygen when the blood passes

through the lungs to produce the compound known as oxyhaemoglobin. In other parts of the body the oxyhaemoglobin breaks down, liberating oxygen, which is used in the oxidisation process (respiration) that the body tissues carry on. See F38(2)

Hafiz besides being the pseudonym of a famous Persian poet is a title conferred upon any Mohammedan who has committed the whole of the Koran to memory

Hafnium a metallic element discovered by Coster and Heye in 1922 and important in the atomic energy field. It occurs in most zirconium minerals to the extent of about 5 per cent

Hag-fish, a blind eel like parasitic sea fish with soft backbone found within the bodies of other fish and called sometimes the borer or the glutinous hag fish. Related to the Lamprey

Hagiarchy the rule or order of Saints

Hagiology a branch of literature that is wholly given up to the history of the saints and the setting forth of the stories and legends associated with their names

Hail hard roughly spherical balls of ice consisting of white cores covered by layers of both transparent and opaque ice frequently falling during thunderstorms. They usually do not exceed 1 in in size but hailstones larger than apples and weighing more than 2 lb have been observed. The general theory of a hailstone is that near the top of a cumulonimbus cloud a raindrop becomes frozen, grows in size by condensation and through collisions with snow particles and eventually becomes so weighty as to overcome the ascending air currents in the cloud. Falling it first encounters supercooled water drops immediately freezing on it increasing the white core and then at lower levels ordinary water drops freezing more slowly producing a layer of clear ice. Before the hail stone arrives at the ground gusts and lulls may transport it several times up and down both regions adding alternate coatings of soft white and hard clear ice

Hake a fish of the cod family found in large numbers in the seas of Europe but not in high favour for the table with fastidious feeders

Halcyon a term associated in olden times with the kingfisher and days of soothing calm. Halcyon days being a frequently used expression. The legend was that the kingfisher laid its eggs on the surface of the sea at the time of the winter solstice when the sea was unruffled. Halcyon is the Greek for kingfisher

Halibut one of the largest of the flat fishes averaging when full grown from 4 to 6 ft in length and highly esteemed for the table. Specimens of still larger size occasionally occur. It is plentifully distributed. Its two eyes are on the right side of the head

Hall-mark A mark or group of marks impressed by an assay office on gold or silver articles guaranteeing the standard of fineness of the precious metal used in them. These marks which have been applied to silver made in London since the beginning of the 14th cent and perhaps earlier make it possible to establish the year and place of assay as also the name of the maker. English pieces of silver usually have not less than four marks, viz. (1) town mark (2) maker's mark (3) date letter (4) sterling mark.

The town mark is rarely changed. In London a crowned leopard's head was used from the earliest days until 1820 with only minor modifications except for the period 1697-1720 when a lion's head erased was substituted. Since 1820 the crown has been omitted.

Until the late 17th cent a symbol was often used as a maker's mark from 1696 to 1720 the first two letters of the maker's surname and subsequently the maker's initials. Owing to the destruction of the earlier mark plates at Goldsmiths' Hall no maker's name prior to the late 17th cent can be identified with certainty.

The London date letter is changed at the end of May each year so each letter covers seven months of one year and five months of the following. The London date cycle has usually consisted of twenty letters the alphabet of each cycle is of different style and the letters are enclosed in shields of different shape

The sterling mark the lion passant was introduced in 1544 and continued in use until 1697 when the higher Britannia standard was introduced in order to discourage the practice current amongst goldsmiths of melting down coin of the realm to make plate. The leopard's head crowned and the lion passant were then replaced by a figure of Britannia and a lion's head erased. Though the regulation imposing the higher standard was withdrawn in 1720 a small amount of Britannia standard silver continued to be made and still is made.

From 1784 until 1890 a plate tax was levied on all silver assayed in Great Britain and an additional duty mark the sovereign's head was used during this period. A Jubilee mark bearing the head of George V and of Queen Mary was used in between the years 1933 and 1935 and in 1953 a coronation mark with the head of Queen Elizabeth was introduced.

The tables of hall marks in Section N give the London date letter cycles from 1598 to 1955. The form of town mark and sterling mark used during each cycle is given at the head of each column. Where a major alteration took place in either of these marks during a date letter cycle the alternative forms are also shown. The date of the change can be established by reference to the notes above. At the bottom of each page the marks used by the major provincial Scottish and Irish assay offices are shown. Owing to lack of space the complete date letter cycles are not shown but two examples only from the 17th 18th or 19th cent. Where a provincial assay office was established in the 17th cent or earlier the marks of one year in the 17th and 18th cent respectively are shown where the office was not established until the 18th cent the marks of one year in the 18th and 19th cent are given.

Halloween (Oct 31) the eve of All Saints Day a time associated especially in Scotland with certain pleasing superstitions attractively set forth in Burns's famous poem. Halloween is the night when young men and maidens are supposed by observing certain rites to have their future wives and husbands disclosed to them.

Hallucinogen, a drug which acts upon the brain to create sensory illusions or hallucinations with a variety of emotional effects. One of the most widely studied is LSD (q.v.) which will produce symptoms very similar to those found in some mental disorders.

Halo a luminous circle usually of 22 radius surrounding sun or moon produced by the refraction and reflection of light by ice crystals of high cirrus cloud. It is a very common occurrence in the British Isles almost one day in three. The inner side is red and the outer a whitish yellow colour. Mock suns i.e. patches of light at the same elevation as the sun are much rarer occurrences sometimes being of great beauty and brilliance. Halo is the Greek for threshing floor. See Coronae

Halogens the group name for the four non-metallic elements fluorine chlorine bromine and iodine. The term halogen means salt producer.

Halteres, the modified hind-wings of the two winged flies or *Diptera* (e.g. the house fly). The equilibrium in flight of these insects depends on the halteres which are commonly called balancers.

Hampton Court Conference presided over at Hampton Court Palace by James I. in 1604 and which brought about his authorised translation of the Bible had an important bearing on the religious differences of the time. James refused to grant tolerations to the Puritans. This sowed the seeds of civil war. Following the conference three hundred English Puritan clergy were ejected from their livings.

Hamper Office, a former Chancery office deriving its name from the fact that its writs and papers were kept in a hamper (hamper). The Chancellor's officer thus came to be known as the Hamper. The Comptroller of the Hamper were abolished in England in 1842.

Hand, a measure of four inches, the average size of the palm used in reckoning height of horses.

Handfasting an informal marriage custom once prevalent in Scotland whereby a man and

woman bound themselves to cohabit for a year and a day and at the end of that period either confirmed their contract by a regular marriage or separated.

Hansard, the title given to the official reports of Parliamentary debates so named after Luke Hansard who in 1774 became partner in a firm of printers to the House of Commons. His son T. C. Hansard was first the printer and then the publisher of an unofficial series of parliamentary debates inaugurated by William Cobbett in 1803. In 1909 production was taken over by H. M. Stationery Office and today's volumes contain full substantially verbatim reports of what is said in both Houses of Parliament.

Hanseatic League was a confederation of North German towns established about 1241 for purposes of mutual protection in carrying on international commerce. The League became so powerful that it was able to dominate the foreign trade of Norway, Sweden, Denmark and even to some extent of London. A branch was established in London and had its guild hall in Cannon Street for hundreds of years. The League existed down to the middle of the 17th cent. Hamburg, Lübeck, and Bremen are the only cities which as free ports still by commercial courtesy retain the name of Hanse towns. *Hansa* is Old High German for Association or Merchants' Guild.

Hapsburg (*Ger. Habsburg*) the ruling house of Austria, 1282-1918, held title of Holy Roman Emperor 1438-1806 except for 1740-5. The aggrandisement of the Hapsburg family was mainly brought about by a series of fortunate marriages. In 1521 when the Hapsburg power was at its zenith Charles V divided his dominions into two branches—Austrian Hapsburg and Spanish Hapsburg. The Hapsburg Danubian Monarchy dates from 1526 when the Hungarian and Bohemian crowns were united with the Austrian patrimony of the Hapsburgs. The triple union lasted 400 years. The murder of the heir to the Hapsburg thrones Francis Ferdinand at Sarajevo in 1914 provoked the outbreak of the First World War. Francis Joseph's great nephew Charles abdicated in 1918 (Prof. C. A. Macartney's authoritative work *The Hapsburg Empire 1790-1918* was published in 1969).

Hare, species of the *Lepus genus* distributed widely through the N. hemisphere. Noted for having four upper front teeth, one pair behind the other, short tufted tail, a cleft upper lip and longer ears and limbs than the rabbit. It does not burrow. The young are born with hair and able to see. A swift animal hunted with grey hounds in the sport called coursing. See Game.

Harleian MSS. comprise some thousands of volumes of MSS. and documents collected by the first Earl of Oxford (1601-1724) and his son Edward. After the death of the latter his widow handed the MSS. over to the nation for £10,000 and they are deposited in the British Museum.

Harlequin, the buffoon of ancient Italian comedy. As adapted to the British stage, however, harlequin is a pantomime character only in love with Columbine, appearing in parti-coloured garments and carrying a wand, by which he exercises a magic influence in thwarting the fantastic tricks of the clown and pantaloone.

Harmattan, a dry wind which may blow between January and May across the Sahara to the Gulf of Guinea. Although affording relief from the tropical heat, vegetation withers because of its extreme dryness and much irritation is caused by the clouds of fine dust which it carries.

Harmonic Motion, regular periodic motion of the kind exemplified by a ball bobbing up and down at the end of a spring and by the piston in a steam engine. It may be simple (simple harmonic motion) or composed of two or more simple harmonic motions. In simple harmonic motion the acceleration is proportional to the distance of the moving body from its original rest position.

Harp-seal, the ordinary Greenland seal, with a dark harp-shaped marking on its back, hence its name. It abounds in Newfoundland waters and further northward towards the Arctic.

Harpy Eagle, a large bird of prey named from the winged monsters of Greek mythology inhabit-

ing the forest regions of Central and South America. There are eight species, one with handsome grey plumage and large crest which attacks and kills animals much larger than itself and was called by the Aztecs winged wolf.

Harrier, a bird of prey of the falcon family of the various species distributed over the world, three breed in Britain: the moorland Hen harrier, the Marsh harrier and Montagu's harrier. They are large birds with long tails, long legs, long wings and gliding flight. They nest on the ground and eat small mammals, frogs, lizards and small birds.

Hartebeest, common African antelope of a grey-brown colour with ringed and knotted horns bending backward and tapering to sharp points. Gregarious of large size and capable of domestication. There are several species.

Harvest Bug, a very small insect of a dark red colour which appears in large numbers in the fields in autumn, and is particularly irritating to animals and man by the tenacity with which it attaches itself to the skin and burrows underneath. Probably the larvae of spinning mites (Trombidoids). In the U.S.A. they are called chiggers.

Harvest Moon, the full moon that occurs nearest to the autumn equinox in September. It rises for several nights running about the same time and yields an unusually brilliant series of moonlight nights.

Harvestmen are like spiders, members of the arachnid class but belong to the distinctly different order of Phalangida. They are common in the countryside in autumn and have small oval bodies and eight long slender legs which besides being mere organs of locomotion also act as sense organs. Known as daddy longlegs in America.

Hashish, an Arabic word for the narcotic substance prepared from the hemp plant (*Cannabis sativa*). It is known by a variety of names: *op*, *blang* in India and *marijuana* in America.

Hatchment in heraldry is a square board, in vertical diagonal position, placed outside a house or on the tomb at the death of a member of a family and so arranged that it indicates the sex and condition of the deceased.

Hawfinch, a well-known European bird of the finch family having a variegated plumage, a sturdy bill and black and white tail. In England it is found in the Midland and Eastern Counties and locally in Scotland.

Hawk. This name is applied to almost any diurnal bird of prey other than eagle, falcon or vulture, but in its strict sense applies only to the *Accipiter* genus—the small Sparrow Hawk and the larger Goshawk, round-winged long-tailed birds with barred underparts. They prey upon small birds captured in flight and small mammals.

Hawk moths, large species of moths thick of body and strong of wing which fly with rapid swooping motion, hence its name. There are numerous handsome species in Britain.

Heath Money was a tax laid on hearths (in all houses paying the church and poor rates). Charles II. introduced it in 1662 and it was repealed in the reign of William and Mary.

Heat, after prolonged controversy over whether or not heat is a substance (formerly called caloric) it was established in the 19th cent. that heat is a form of energy. It is in fact the combined kinetic and potential energy of the atoms of which a body is composed. Heat can be turned into other forms of energy: e.g. a red-hot body loses heat by radiating it in the form of electromagnetic waves (radiant heat—chiefly infra red rays). Heat may also be transferred from one place to another by conduction and in fluids, by convection. All three processes occur when a glowing fire heats a room. A unit quantity of heat is the calorie which is the amount of heat sufficient to raise the temperature of 1 gm. of water by 1°C. In general, adding heat to a body raises its temperature. The number of calories required per gram of material to raise the temperature 1°C is called the *specific heat* of the material. However, adding heat may not raise the temperature but may instead cause a change of state: e.g. from solid to liquid (melting) or liquid to gas (evaporation). The amount of heat required to

melt 1 gram of a solid is called the latent heat of melting. Similarly there is a latent heat of evaporation. Strictly speaking the specific and latent heats of a substance depend on how much its pressure and volume are allowed to vary during the measurements. Water has a high specific heat and this makes the oceans a vast heat reservoir a factor of great meteorological significance. The science of heat is called thermodynamics and is of great importance in physics and chemistry. See F17

Heath flowering plants of the *Ericaceae* family. Heaths are widely distributed over uncultivated spaces of Europe and Africa. In Britain they are represented by heather (of which there are several species) and ling (*Calluna vulgaris*) which cover thousands of acres of moorland. Some of the African or Cape heaths are very beautiful and much prized by florists. One species of heath (*Erica arborea*) which grows in S. Europe and N. Africa has close grained woody root stock used for making briar pipes. See T7(2)

Heat Wave is a spell of very hot weather due chiefly in the British Isles to a warm southerly current of air caused by the presence of an anticyclone over western or central Europe at the same time as a depression is stationary over the Atlantic. High humidity increases the discomfort.

Hegira, an Arab term signifying departure or flight and used in reference to Mohammed's departure from Mecca for Medina A.D. 622 from which date the Mohammedan era is reckoned.

Helicopter heavier than air aircraft which obtains its lift from blades rotating above the fuselage in windmill fashion. The first successful helicopters were the Focke-Wulf H1, a German machine (1936) and the VS-300 designed by Igor Sikorsky flown in 1937. Helicopters can hover and rise and descend vertically in addition to being capable of horizontal flight.

Heliotrope a favourite sweet scented flowering plant common in tropical and sub-tropical countries. The Peruvian heliotrope is the cherry pie of our summer garden borders. See T9(1)

Helium a gaseous element first discovered by means of the spectroscopic in the sun's atmosphere. This discovery made in 1868 by the astronomer Sir Norman Lockyer was followed in 1895 by Sir William Ramsay's proof that the element existed on earth. He found it in the uranium ore cleveite. Later it was established that helium is formed by the radioactive decay of many elements which emit α particles (nuclei of helium atoms) and is contained in all radioactive materials. The largest source of helium is natural gas, the richest in helium being the gas from certain wells in Utah, U.S.A. Next to hydrogen, helium is the lightest gas known has a lifting power equal to 92% of hydrogen and the advantage that it is inert and non inflammable. It is used for inflating air ships. Ordinary air contains 1 part in 200 000 of helium. It was the last gaseous element to be liquefied, this being achieved by Onnes in 1908 in Leyden. Liquid helium has many remarkable properties only imperfectly understood. As well as being scientifically fascinating it is indispensable in cryogenics (v) as a medium for cooling other substances to temperatures near absolute zero. Hydrogen fusion in the H bomb produces helium.

Hellebore, a plant of the *Ranunculaceae* (buttercup) family. The best-known British examples are the green and stinking varieties. There is also a garden kind which flowers in December called the Christmas Rose. Hellebore yields a bitter substance which forms a drastic purgative but is now little used. See T9(1)

Hellenic Art. The art of ancient Greece may be roughly divided into three periods: the prehistoric period (c. 1500-1000 B.C.) of the bronze age; Mycenaean the archaic period (c. 800-500 B.C.) and the classical period (c. 500-340 B.C.). Of the first period centred on Mycenae in Peloponnesus but extending to the coasts of Asia and the city of Troy we can mention only the massive stone gateways and the shaft graves of Mycenae, where the archaeologist Schliemann discovered painted vases, gold cups, bronze swords, and ornaments of what had once been a great, if primitive, civilisation. During the

archaic period sculpture was the principal form of art expression. The magnificent male and female figures are reminiscent of Egyptian art but are distinctive in liveliness of facial expression. The vase paintings of this period became more elaborate depicting scenes from mythology or ceremonial events. Typical of classical Greek art is the representation of the beautiful and healthy human body deliberately posed and often carrying out heroic or athletic acts. The vast majority of these statues are known to us only through Roman copies. The *Hermes* of Praxiteles (born c. 385 B.C.) is possibly the only existing statue which can be assigned with any degree of certainty to an individual artist. Almost the whole of the Greek genius in architecture was expended on temples which are all basically similar in design—a rectangle with a low pitched gabled roof resting on side walls. The three orders Doric, Corinthian and Ionic mainly referred to the type of column used but naturally the whole building was influenced thereby. Some of the main buildings are on the Acropolis a hill outside Athens on which stand the Parthenon (from the outer frieze of which the Elgin marbles now mostly in the British Museum were taken) the Erechtheum famous for its Porch of Maidens, and the gateway known as the Propylaea with its broad flight of marble steps. Apart from that on vases no Greek painting has come down to us although Greek painters existed and were noted in their time. All we have are copies in mosaic and fresco made by the Romans at Naples and Pompeii. Of Greek literature in prose verse and the drama little can be said here. To the epic period (c. 8th-6th cent. B.C.) belong Homer's *Iliad* and *Odyssey*. Hesiod's long poem *Work and Days* and Sappho's love poems and Pindar's Odes. The period of Pericles in the 5th cent. B.C. produced more great literature than any comparable period in history; the philosophical writings of Plato and Aristotle the tragedies of Aeschylus Euripides and Sophocles the comedies of Aristophanes—all these are still part of the European tradition and together with Greek architecture played a major part in the Renaissance (see F44)

Hellenistic Art, the art of the period of Greek civilisation which began with the conquests of Alexander the Great (356-323 B.C.) and lasted until his former empire (which encompassed most of the Middle East and part of North Africa) was conquered by the Romans in 146 B.C. Culturally it was an important period because it spread Greek culture far beyond its original boundaries—even as far as the north of India and its centres spread from Athens to the cities of Alexandria in Egypt, Antioch in Syria and Pergamum in Asia Minor. But equally Eastern culture spread to the West; democracy was replaced by absolute monarchy; cosmopolitanism took the place of the Greek tendency to believe that all who were not Greeks were barbarians and mystical philosophies took the place of Greek rationalism. This was a sensuous secular pleasure-loving rootless society and these tendencies were reflected in its art. Hellenistic sculpture was sensual effeminate and violently emotional yet it depicted individuals and not always noble or beautiful ones (Classical Greek sculpture was idealistic showed types rather than individuals and appealed to the intellect rather than the emotions). Some of the best examples came from the school at Pergamum and later from the island of Rhodes and the titles themselves speak of their nature. *The Dying Gaul*, *Gaul Slaying his Wife and Himself* and the famous *Laocoon* (representing Laocoon and his two sons being crushed by two enormous serpents). All these date from about 240 to 50 B.C.—for the culture did not immediately end with the Roman conquest. The enormous frieze of the altar of the temple in Pergamum depicts a battle between gods and giants with tremendous realism and brutal violence far removed from the serene art of classical times. Portrait sculpture is typical of Hellenistic art where it may almost be said to have been invented, since such ventures in the past had been idealistic rather than realistic. The great Hellenistic cities were geometrically planned and fine public buildings made their

appearance in which the slender and graceful Ionic or the ornate Corinthian columns took the place of the more austere and heavy classical ones. Alexandria was famed for its library of 700,000 books and was the centre of philological schools such as the Stoics and Epicureans. Here too worked the mathematicians Euclid and Archimedes the physicians Erasistratus and Herophilus and the geographer Pytheas. But Hellenistic literature was a pale reflection of the glories of the past and we mention only the comedies of Menander and the pastoral verse of Theocritus of Syracuse.

Hemiptera, the order of insects to which belong the true bugs. Their wing structure is in most species incomplete hence the term hemiptera. This order includes the familiar water insects the water boatman and water skater also the aphids cicadas leaf hoppers scale insects. See T29(2).

Hemlock a plant of the *Umbelliferae* family growing in all parts of Britain and containing a strong alkaloid poison. Used medicinally this alkaline substance is of considerable service being a powerful sedative. According to Pliny hemlock was the poison used by the Athenians in putting criminals to death.

Hemp (*Cannabis sativa*) name of a plant native to Asia now cultivated widely for the valuable fibre contained in the stalk or in some species in the leaves. Hemp fibre has been replaced by cotton for textiles and by rye for sacks and is now chiefly used for cordage and twine. It contains a resinous substance from which the root-cashish is made. The seed yields a valuable oil. The term hemp is also used for other fibre plants including manila hemp from the Philippines, sunn hemp from India, esal from W and I Africa and phorium from New Zealand.

Henbane a plant found in Britain and other parts of Europe and Northern Asia. It belongs to the potato family *Solanaceae* grows mostly on waste ground and bears yellow brown flowers veined with purple. The leaves yield a poisonous alkaloid substance which medicinally prepared and administered, is of great use. The tincture of henbane is often preferred to laudanum.

Heptarchy a word derived from the Greek *hepta* seven and denoting the seven kingdoms (*archai*) into which Anglo-Saxon England was divided before 900. The seven were Kent, Essex, Sussex, Wessex, Mercia, East Anglia and Northumbria.

Herculeum, a plant of the *Umbelliferae* family common in southern and central Europe though only one species the cow parsnip grows in England. It has a bitter root and from the juice of the stem an intoxicating liquor is occasionally prepared.

Herald an officer of state empowered to make formal proclamations and deliver messages from the sovereign or other high personage whom he serves. In the developments which took place in armorial bearings the herald was the functionary charged with the duty of their proper depiction.

Heraldry the knowledge of armorial bearings, was mainly the outcome of the love of outward distinction which prevailed in medieval times.

Heraldry says Stubbs became a handmaid of chivalry and the marshalling of badges, crests, coat armour, pennons, helmets and other devices of distinction grew into an important branch of knowledge. The shield or *escutcheon* is the ground upon which armorial signs are traced the colour of the shield being called the *tincture* the signs recorded the *charges*. There are seven tinctures—or (gold) *argent* (silver) *gules* (red) *azure* (blue) *vert* (green) *purpure* (purple) and *sable* (black). The *charges* are classed as Honourable and Subordinate ordinaries comprising lines and geometrical forms and Common ordinaries which latter includes all representations of natural objects. There is also a system of external signs such as crowns coronets mitres helmets mantling, wreaths and crests, each having its distinctive significance. For other distinguishing marks see *Hatchments*, *Quartering*, *Rampant*, *Peau*.

Heralds' College or **College of Arms** was incorporated by Richard III in 1483. Its head is the Earl Marshal (an office hereditary in the

family of the Dukes of Norfolk) and there are three Kings of Arms six Heralds and four Pursuivants. The business transacted is wholly connected with the tracing of genealogies and the granting of armorial bearings. In Scotland the Heraldic functions are performed by the Lord Lyon King of Arms.

Herbarium, a systematically classified collection of preserved plants. One of the largest in the world is at the Royal Botanic Gardens at Kew. **Heredity** is the study of the transmission of physical and mental characteristics from one generation to another. Gregor Mendel (1822-84) a great experimenter in the field of inheritance established the principle embodied in Mendel's law in his work published in 1866. The ideas which he then put forward were forgotten until the early years of this century but today they form the basis of the modern study of genetics. Genes are the units of heredity they are contained in the chromosomes of the cell nucleus. In human cells there are 46 chromosomes—22 pairs of characteristic shape and a 23rd (the sex chromosomes) similar in women and dissimilar in men which unite in the process of fertilisation. An individual can only develop even under the most favourable surroundings as far as his inherited characteristics are his genes will allow him to do so. It is in the development of personality that the interplay between heredity and environment becomes most apparent. See *The Evolution of Organisms* P45 also Q27.

Hermaphrodite, animals or plants possessing both male and female reproductive organs e.g. snail earthworms most flowering plants.

Hermit Crab a decapod with a soft asymmetrical body which it protects by thrusting it into an empty gastropod shell e.g. whelk which it carries about only abandoning it when necessary for a larger one. Found in all seas many live in commensal relationship with sea anemones etc.

Heron a large wading bird with long curved neck and pointed bill is a member of the *Ardeidae* family of which there are many species. Egrets and bitterns are included as herons. Herons are to be met with in marsh lands and near rivers and lakes where they feed on fish and frogs. They nest in trees in large numbers these colonies being called heronries. The common heron is native to England and other species from the Continent are frequent visitors.

Herring a common sea fish related to the sardine and pilchard abundant in northern seas and found in large numbers round the British coasts. The herring fishery is the most important fish industry in this country a large fleet being engaged in it. The fishing season proper lasts from May to October the enormous shoals being followed as they move from place to place. The spawning season is about the end of August. One female herring may produce 20 to 50 thousand eggs which sink to the sea bed where they develop.

Hibernation, the dormant condition in which numerous mammals, reptiles, amphibians, insects, plants etc. pass the winter. The rate of metabolism slows down and the body temperature drops to that of the surroundings. Work on these low temperatures and their physiological effect has led to improved surgical techniques. Animals of the torrid regions pass through an analogous period (aestivation) during the hot season when the sources of food are dried up.

Hickory several species of American tree of the walnut family remarkable for its very hard solid heavy white wood and bearing an edible four lobed nut.

Hieratic Art, a type of art (typified by the major part of the art of ancient Egypt) which is (a) exclusively religious and (b) conventionally based on earlier forms and traditions.

Hieroglyphics are the earliest form of pictured symbolic expressions and are supposed to have been introduced by the ancient Egyptians. They consist of rude depictions of animals, plants, signs and objects and in their later examples express in abbreviated form ideas and records from which significant historical information has been gleaned. The deciphering of

Egyptian hieroglyphics long formed an ardent study but gradually the key to the riddle was uncovered and most of the ancient records can now be understood. Besides the Egyptian there are also Hittite, Minoan and Mayan hieroglyphic scripts. See Rosetta Stone.

Hi Fi means high fidelity and refers to gramophones, tape recorders and similar apparatus which will faithfully reproduce sounds. It is not too difficult these days to amplify electrical signals without distorting them much. It is more difficult to turn electrical impulses into exactly equivalent sound waves (with a loudspeaker for example) or *vice versa* (with a microphone or gramophone pick up). Pick up and loudspeaker are therefore often the weak links in domestic hi fi and faults in their design deficiencies in the electronic amplifiers in perfect gramophone motors can all contribute to audible results ranging from the tolerable to the execrable. Almost perfect sound reproduction is however available to enthusiasts possessing a suitable combination of disc, amplifier, loudspeaker and financial resources. There are periodical magazines which provide guidance. See also F62-5.

Hindi the official language of India. See M44.

Hinduism See J24.

Hindustani the spoken form of Hindi (written in Devanagari script) and Urdu (written in Arabic characters).

Hippogriff, a fabulous animal like a horse in body but with the head, wings and front legs and claws of an eagle. The monster frequently appears in the romances of the Middle Ages.

Hippopotamus or river horse, the largest living representative of the hog family widely distributed over Africa where it lives in herds. It is of immense bulk attaining a length of 12 ft. and a weight of 4 tons and stands about 5 ft. high. Its skin is hairless and about 2 in. thick and it has a pair of tusks often weighing as much as 6 lb. It spends most of its time in the water and lives entirely on vegetation, both aquatic and terrestrial. The pigmy hippopotamus which occurs in forests and swamps in W Africa is only half the size.

Histology is the study of the structure of plant and animal tissues. These mainly consist of groups of cells with similar functions e.g. muscle, brain tissue.

Hittites an ancient race (often mentioned in the Old Testament) who inhabited Cappadocia (region of Eastern Asia Minor) from the third to the first millennium B.C. Excavations have revealed that they attained a high level of civilization round about 1350 B.C. The Hittites were rivals of Egypt, disputing with the Pharaohs the mastery of the Middle East. They were the first to smelt iron successfully.

Hobby a bird of the falcon family 12-14 in long. Local breeding visitor to England and Wales April-Sept. Irregular visitor to Scotland and Ireland. They winter in Africa.

Hog the common name of animals of the *Sus* family including the wild boar, pig and sow. The wild boar *Sus scrofa* is the common ancestor. The skin of the hog is covered with bristles, the snout truncated and each foot has four hoofed toes. Hogs are omnivorous feeders and eat almost anything that is given them.

Hogmanay the Scottish New Year's Eve festival and a national holiday of the country. The custom of demanding Hogmanay bread is still upheld in many parts of Scotland.

Hogshead, a cask of varying capacity also a specific measure. In the old English measure a hogshead was 63 old gallons of wine (= 52½ imperial gallons). Of beer 54 old gallons make a hogshead.

Hollands, Schiedam, or Schnapps, a kind of gin made mostly in Holland from rye and malt with a flavouring of juniper berries.

Holly a hardy evergreen shrub largely grown in England. Its bright dark green prickly curved leaves and clusters of red berries are familiar in all parts of the country and used as house decoration between Christmas Eve and Twelfth Night, probably a relic from Roman and Teutonic customs. Its wood is white and hard valued for carved work while its bark yields a gummy substance which is converted into bird lime.

Hologram a photographic record taken under special optical conditions of light reflected from a scene or object. The hologram is typically a piece of film. However it is nothing like a photographic negative of the ordinary kind for one thing it will show an unintelligible pattern of light and dark patches. Nevertheless it is illuminated (again under special optical conditions) the light coming through it will form a three dimensional image of the original object. Another radical difference between a hologram and an ordinary film is that if the hologram is cut up each fragment can be used to construct the entire image. Holography as a method of recording and reproducing photographic information was conceived by Gabor in 1947 but was only fully realised in practice after the invention of the laser (qv). The use of laser light is one of the special conditions referred to above. Technical applications are being explored in many laboratories.

Holy Alliance an alliance ostensibly for conserving religion, justice and peace in Europe but used for repressing popular tendencies towards constitutional government. Formed by Alexander I. of Russia, Francis I. of Austria and Frederick William III. of Prussia at Paris on Sept. 26 1815. Subsequently joined by all the sovereigns of Europe except the Pope and the King of England. It ended after the 1830 revolution in France.

Holy Coat of Treves a garment preserved in the Cathedral of Treves and said to have been worn by Christ. It was brought from Jerusalem by the Empress Helena in the fourth century.

Holy Rood, an annual Roman Catholic festival held on Sept. 14 to celebrate the Elevation of the Cross in commemoration of its re-erection in Jerusalem by the Emperor Heraclius in 628 after retaking it from the Persians. Also included in the Church of England calendar.

Holyrood the ancient royal palace at Edinburgh dating from the 15th cent. and inhabited by many Scottish sovereigns notably Mary Stuart the rooms occupied by her (including the one in which Rizzio was murdered) being still shown. It is now known as Holyrood House and is still used as a royal residence.

Holy Roman Empire, the title which the German Empire received in 962 when Pope John XII crowned Otto I. at Rome. It endured until 1806 when Francis II. became Emperor of Austria.

Holy Water, water blessed by a priest and kept in small fonts at the entrance to Roman Catholic churches and used by worshippers going in and out or by priests in sprinkling.

Holy Week is the week preceding Easter Sunday and includes the days of the sufferings of Christ ending on Good Friday.

Honey the sweet syrup formed by bees from the nectar of flowers, the sucrose in the nectar being converted into a mixture of the simple sugars glucose and fructose. Hybla, an ancient town of Sicily, on the southern slope of Mt. Etna, was famous for its honey.

For your words they rob the Hybla bees
And leave them honeyless (*Julius Caesar*)

Honey-eater, an Australian bird (of which there are many species) provided with a long curved bill and tufted tongue. It lives by sucking the nectar from the flowers which abound in rural parts of Australia and New Zealand.

Hookah, an Oriental pipe for tobacco smoking the smoke being drawn through the water of a goblet (commonly a coconut shell) by means of a long flexible tube.

Hoopoe a remarkably handsome bird with vivid black and white barred wings and tail and black tipped crest which opens like a fan. Ranges over Europe, Asia and Africa. It has bred in England and Wales and occurs in the British Isles in small numbers at all seasons. Other species are confined to Africa, Madagascar and India.

Hops the female cones of the hop plant used in brewing. Their essential oils give beer an aromatic flavour and their tannin and resin act as a preservative as well as accounting for the bitter taste desired. The hop is a perennial climber belonging to the mulberry family. The male and female organs are on separate plants.

as only the female flower heads are commercially useful female plants predominate in a hop garden only a very few male plants being grown so that the female flowers can be fertilised

Horizon the limit of vision the apparent line where sea and sky or land and sky meet This is termed the *sensible* or visible horizon An ordinary person at the height of 5 feet can see for 3 miles at 20 feet 6 miles at 50 feet 91 miles and at 1 000 feet 42 miles The figures are approximate

Horn or French Horn a brass instrument of the trumpet family (4½ played by three valves) whose tube is very thin and long (Horn in F = 12 ft.) In consequence the tube is curled in a complicated manner Owing to the sweet tone it is capable of producing the Horn sometimes plays as part of the wood wind.

Hornbill large bird found in Africa and oriental regions remarkable for its having an immense horned upward-curved helmet growing over its downward curved beak. It inhabits tropical regions and feeds on fruits When the female has laid her eggs in the hollow of a tree the male bird stops up the entrance and keeps her imprisoned until the hatchling is completed and the young ones are able to fly There are about 45 species.

Hornblende the commonest member of the amphibole group of minerals a silicate of calcium magnesium iron and aluminum of a dark green colour It is a constituent of numerous rocks including diorite syenite and hornblende schist.

Horned Viper a curious African genus of *Viperidae* with a small pointed bone over each eyebrow a venomous species found in Egypt is thought by some to be identical with the adder mentioned in Genesis xlix 17

Hornet a general name for many of the bigger wasps It usually nests in hollow trees and despite its rather ferocious appearance does not sting unless unduly provoked.

Horology the science of time measurement including the construction and management of clocks watches etc Instruments of this kind are not known to have existed before the 12th cent and until the introduction of the pendulum in the 17th cent clocks were ill regulated and inaccurate The time-recording mechanisms of the present day include (a) the clock which shows the hours and minutes by hands and strikes the hours and sometimes quarters (b) the *timepiece* which is not generally a fixture and shows the time but does not strike (c) the watch which is a pocket time keeper (d) the *chronometer* which indicates the minutes portions of time (e) electric timepieces means electric clocks (f) the highly accurate quartz crystal and atomic clocks used for astronomical purposes See Clocks

Horse Chestnut one of the large forest trees, with ample branches and full foliage and much esteemed for parks and ornamental grounds The bark and fruit seeds yield substances of commercial value but the timber is not worth much The tree came originally from Asia about the 18th cent

Horse Guards the building in Whitehall which until 1872 was the headquarters of the Commander-in-Chief of the British Army The archway is still sentinelled by mounted guards.

Horse Latitudes the latitudes of the sub-tropical high pressure systems between the trade winds and the prevailing westerlies characterised by light variable winds and low humidity

Hospitaliers, Knights, were of the order of St. John of Jerusalem at first devoted to the aid of the sick but afterwards military monks who became prominent figures in the Crusades of the 12th cent They adopted the Benedictine black habit with the eight-pointed cross worn by the modern St John's Ambulance Brigade In 1809 they took Rhodes, but were expelled by the Ottomans in 1822 In 1880 the emperor Charles V gave them the island of Malta, which as Knights of Malta they held until 1798 when they were dislodged by Napoleon. The Knights still survive as a sovereign order with headquarters in Rome See Templars and Teutonic Order

Hottentots, name given to certain African natives by Dutch settlers in the 17th cent They used

to occupy the greater part of Cape Colony and though driven out a number still survive in S W Africa Appear to be related to the Bush men though their culture is more advanced In addition to herding they practise some farming and know how to smelt iron

Hounds are dogs that were originally bred and trained for hunting such as the greyhound foxhound bloodhound wolfhound deerhound beagle harrier etc but now often kept also as domestic dogs The greyhound deerhound and wolfhound hunt by sight the others with the bloodhound hunt in order track by scent

Hour-glass a glass instrument tapering to the middle to a narrow orifice through which a sufficient quantity of fine sand gravitates to mark an hour of time When the sand has run through from one end it can be reversed and made to count the hour in the opposite direction The same kind of glass with smaller supplies of sand will indicate shorter periods as an egg glass which runs its course in three minutes—time to boil an egg by or to gauge the length of a telephone trunk call

House Flies are world wide and prolific Their eggs are hatched within 24 hours of being laid and full maturity is attained in a month They feed mainly on decayed animal and vegetable matter

Hovercraft or air cushion vehicle is a craft which is lifted on a pad of air underneath it This pad or cushion must be at a pressure higher than that of the atmosphere and it is made by sucking in air above the craft and ejecting it in a downward stream all round the lower edge The stream is guided by a flexible skirt and the high pressure air pad is contained partly by the skirt and partly by the air stream itself which forms a continuous air curtain all round the vehicle Hovercraft are being intensively developed and there are variations in the basic scheme just described and also in the means of propulsion which can be by air or water jets or propellers Hovercraft were devised by Cocker in the 1950s and a full scale example appeared before the British public in June 1959 Craft of over 100 tons are made commercially and much bigger ones conceived The air pad support means that hovercraft can move over land water or marsh Cross Channel hovercraft were introduced in 1966

Howler Monkey a genus of South American monkey noted for a laryngeal conformation which enables it to emit a loud reverberant noise something between a yell and a howl as the name suggests

Huanuco-bark a medicinal bark brought from the Peruvian town of that name and derived from the *Cinchona macrantha* tree See Cinchona

Huguenots, a name applied to the French Protestant communities of the 16th and 17th cent Henry of Navarre by the Edict of Nantes in 1598 granted them religious freedom, but more than a quarter of a century before—Aug 24 1672—thousands had been put to death in the massacre of St Bartholomew The revocation of the Edict of Nantes by Louis XIV in 1685 drove thousands into exile in England Holland Germany and America

Humanism. See 325.

Humble-bee or Bumble bee the common name of the insects of the genus *Bombus* of the Hymenoptera order They live in small communities comprising males females and drones their habitations being underground. They do not have one queen bee only like the hive bee but several females occupy the same nest and these alone live through the winter breeding and forming new colonies in the spring Although this large bee buzzes loudly it does not sting

Humidity, the state of the atmosphere with respect to the water vapour it contains Absolute humidity is defined as the density of the vapour present while relative humidity more frequently employed indicates the degree of saturation i.e., the ratio of the actual vapour pressure to the saturation vapour pressure at the particular temperature expressed as a percentage

Humming Birds are so called because of the humming noise made by the vibration of their wings in flying They are of radiant plumage and are among the smallest birds The smallest bird in the world is the Fairy or Princess Helen s

humming bird of Cuba. The body is 2 in. long and the eggs are $\frac{1}{16}$ in. long. There are from four to five hundred species, and they are confined wholly to North and South America, being most numerous in the tropical latitudes. They have long slender bills and tubular tongue which reach down into flowers to suck up the nectar on which they feed.

Hummum, the original name for what is now called the Turkish Bath in this country. One of the first of these baths to be established in London was the Hummums in Covent Garden.

Hundred, the ancient divisional name given to a portion of a county for administration or military purposes. It is supposed to imply the territory occupied by a hundred families, or the space of a hundred hides of land, or the capacity of providing 100 soldiers. Each hundred had its hundred court with powers similar to those of a manor court, but this was abolished in 1867 by County Court Act.

Hundred Days, the interval of time between Napoleon Bonaparte's entry into Paris after his escape from Elba and his departure after his abdication, extending from March 20, 1815 to June 28. During this period occurred the battle of Waterloo, June 18.

Hundred Years' War, a term applied to the almost incessant contest between England and France lasting from 1338 to 1453, including such famous battles as Crécy, Poitiers, and Agincourt, and engaging successively Edward III, Henry V and Henry VI, among English kings.

Huns, a fierce Asiatic race which swept over eastern Europe in the 4th cent. Under Attila, about the middle of the 5th cent. they obtained control of a large portion of central and eastern Europe, forcing even Rome to pay tribute. Their defeat at Châlons sur Marne in 451 by a mixed army of Romans, Goths, and Teutonic tribes, and the death of Attila in 453 terminated their empire.

Hurdy-Gurdy, an Italian rustic so-called musical stringed instrument of the lute order, the sounds of which are produced by the action of a rosined wheel turned by the left hand, the notes being made by the fingering of the right hand.

Hurricane. See **Cyclone** and **Wind**.

Hydra, an aquatic animal of simple structure whose body is in the form of a cylindrical tube with a disc-shaped base by which it attaches itself to any shifting substance. Its mouth is surrounded by tentacles by which it catches its food. The Hydra has the power of reproducing lost parts.

Hydrates are compounds containing water of crystallisation.

Hydraulic Ram, a form of automatic pump used to raise water to a height by the action of its own falling velocity.

Hydraulics, the science of applied hydrodynamics or water machine engineering ranging from pumps to marine engines.

Hydrocarbons are compounds of carbon and hydrogen. They include the *paraffins* which are saturated compounds (e.g. methane, ethylene, acetylene, and other series which are unsaturated compounds with ring structures, e.g. benzene, naphthalene, and anthracene). Petroleum is composed almost entirely of hydrocarbons. See F23.

Hydrochloric Acid, a solution of hydrogen chloride gas in water and resulting in considerable quantities as a by-product of the soda ash or salt-cake manufacture. Its solution forms the common hydrochloric or muriatic acid of commerce. It is present to the extent of nearly half a per cent. in the digestive juice secreted by the stomach.

Hydrocyanic Acid, cyanide of hydrogen or prussic acid, very poisonous and of the odour of bitter almonds. It is formed by the action of acids on sodium or potassium cyanide. Used to kill weasps (and in the gas chamber in the U.S.A.). It is a very important chemical on account of the reactions of its derivatives in many synthetic fields. Discovered by Scheele in 1782.

Hydroelectric Schemes.—The sun's energy has been indirectly exploited in the past by harnessing the energy of the winds and rain. The climate is due, essentially, to differential heating of the earth. The resulting convection currents in the air (the motion of which is complicated by the rotation of the earth) give rise to winds.

Moisture is collected from the sea and deposited high up on mountains as rain. Some of the gravitational energy may be collected as hydro power. Simple windmills or waterwheels are so undependable that they have not been used to any extent since the beginning of the Industrial Revolution. However, the modern form of the waterwheel—the hydroelectric generation plant—is extensively used in mountainous countries and about a third of the world's electricity is produced by this means. The essential requirements for a modern hydroelectric scheme are a river with a sufficient flow of water to provide the required power, a large head of water so that a cheap compact turbine can be used and a dam so that water can be stored until it is required. In some cases a hydroelectric scheme is made economic by being associated with an irrigation or drainage scheme. Such multipurpose schemes are especially important in certain Commonwealth countries, notably India and Pakistan, where most hydro projects are of this type. Other well-known examples include the Snowy Mountains Scheme in Australia and the Aswan High Dam in Egypt. Although over 90 per cent. of the electricity in certain individual countries, notably Norway, Sweden, Portugal, Switzerland, and Uganda, is produced from hydroelectric schemes, only a relatively small fraction of the total potential has been exploited. This fraction varies from about a third in Western Europe to a quarter in the United States to a very small fraction in Alaska, Canada, Africa, and the hinterland of Asia.

Hydrofluoric Acid is obtained by distillation of fluor spar with sulphuric acid, and is a compound of fluorine and hydrogen. Its action is highly corrosive, a valuable agent in etching on glass, and a rapid decomposer of animal matter.

Hydrogen, Symbol **H**, the simplest element, atomic number (*q.v.*) of 1, colourless and the lightest of all substances. Cavendish in 1766 was the first to recognise that it was an element. It is 14.4 times as light as air, and is found in a free state in volcanic regions. It can be obtained by the action of metals on acids and forms an explosive mixture with air, burning with oxygen to form water. Commercially it is used to produce the very hot flame of the oxy-hydrogen blowpipe for cutting metals, to fill balloons and airships, to harden certain oils and render them suitable for margarine and soap production. The gas can be liquefied, and the presence of the isotope deuterium was detected by Urey in 1931 in the residue of the evaporated liquid. The third isotope, tritium, is very rare. See also Deuterium, Tritium and F23, F28.

Hydrography, the science of water measurement as applied to seas, rivers, lakes, currents, rocks, reefs, etc., and embracing the whole art of navigation.

Hydrometer, an instrument for measuring the specific gravity of liquids, especially for ascertaining the strength of spirituous liquors and solutions. It is usually in the form of a glass bulb to the lower end of which a smaller bulb containing mercury is attached, which forces the instrument to sink into the liquid which it is to test. The larger bulb has a scale fixed to it and the indication on this scale of the sinking point shows the specific gravity. There are many varieties. Twaddell's—a pear-shaped bulb containing mercury—Beaumé's of similar construction, but applicable to liquids both heavier and lighter than water. Sykes's, largely employed for determining the strength of alcohol, and Nicholson's, used for taking the specific gravities of solids.

Hydrotherapy, the method of treating disease with water, either by bathing or drinking. Natural springs of special chemical and therapeutic properties, such as sulphur springs, and other mineral sources have been used since prehistoric times for this purpose. It is probably one of the most ancient methods of cure. Recently the beneficial effects of pure water treatment have been advocated. Hydrotherapeutic establishments have been set up in many health resorts. **Hydroponics**, the culture of plants without soil. The plants are grown with their roots dipping into a solution of nutritive mineral salts, or they may be rooted in sand which is watered with such a solution.

Hydrostatics the science of the pressure and equilibrium of liquids that are non elastic

Hydrozoa are a class of water animals of the *Coelenterata* phylum to which *Hydra* (q v) belongs. In one order of the Hydrozoa free swimming colonies showing marked division of labour between the individual units occur. This order includes the Portuguese man of war

Eyena a nocturnal carnivore with powerful jaws. The striped hyenas inhabit N Africa, India and S W India. The brown hyenas with long shaggy hair are natives of S Africa. The spotted or laughing hyena noted for the peculiar cry from which its name is derived is also confined to Africa.

Hygrometer an instrument for measuring the amount of water vapour in the atmosphere. A simple form of hygrometer known as the wet and dry bulb consists of two vertical thermometers affixed to a frame. One bulb is exposed to the air and the other is covered with muslin which dips into a water bath to keep it moist. If the air is saturated, it takes up no moisture from the wet bulb and the two thermometers read the same. If the air is not saturated, evaporation takes place from the wet bulb, latent heat is absorbed from the air and the temperature of the wet bulb is lower than that of the dry bulb. Relative humidity and dew point of the air can then be derived from suitable tables. Hygrometers depending upon the expansion of human hair and gold beater's skin and the deposition of dew on a polished surface when cooled sufficiently are also in general use. See Humidity

Hymenoptera, the order of insects to which bees, wasps, hornets, ants and sawflies belong. They have a well defined waist, two pairs of membranous wings coupled together, mouth parts modified for biting or sucking, the females possess an ovipositor used for depositing eggs and is sometimes modified for stinging. There are about 70 000 species in this order and many live in highly organised communities. See also Ichneumon Fly

Hypocbola, a curve described by certain comets that go round the sun and never return.

Hypsometer an instrument formerly used by mountaineers to find the height above sea-level by indirectly measuring the atmospheric pressure by determining the boiling point of water at the particular height. Based on the fact that as pressure decreases with height so the boiling point is lowered. Superseded by the aneroid barometer.

I

Ibex, wild goats of several species found in the mountain regions of Europe, Asia and Africa. The male has exceedingly large curved ridged horns. The species that lives in the Alps is called the Stenbock or bouquetin.

Ibis belongs to a family of birds related to the stork. The sacred ibis of ancient Egypt is now extinct in Egypt but is found in the lakes and swamps of the Sudan near the Upper Nile. It has white and black plumage and a long curved beak. Other species are found elsewhere. The Glossy Ibis (black plumage glossed with purple and green) occasionally visiting England.

Ibo, a large tribe of S.E. Nigeria, numbering between 5 and 6 million. Since the end of British rule they have been active in their struggle for national independence and under their leader Ojukwu embarked upon the secessionist state of Biafra and the unsuccessful civil war against Federal forces. The Hausa and the Yoruba are the other main Nigerian groups.

Ice is frozen water. It is a colourless, crystalline and brittle solid. Being only 92% as dense as water it floats on the latter. The expansion which occurs as water changes into ice causes the fracture of water pipes, though the fracture only becomes obvious when the ice melts and leaks out through the crack. The temperature at which ice forms is 32°C or 32°F . Ice can be melted by pressure and the ease and smoothness with which one is able to skate on ice depend on this phenomenon.

Ice Ages, periods during which the continents were partly or largely covered by ice-sheets and glaciers. The present-day ice-sheets of Green-

land and Antarctica are relics of the most recent Ice Age which began in the Pleistocene and ended about 10 000 years ago. Much of the southern hemisphere experienced an ice age at the end of the Carboniferous Period. Ice ages are recorded from isolated localities during the Pre Cambrian but there is no evidence that these were simultaneous. See F9(1) 48(2) A2. Icebergs are detached masses of glacier which subside into the sea and float as wind or current may take them. About one ninth of an iceberg is above sea level. The North Atlantic is the chief home of icebergs which reach the ocean from the ice clad plateaux of Greenland. Some of these floating masses of ice are of enormous proportions and constitute in the spring and early summer seasons a great menace to the safety of ships as was disastrously shown in the Titanic catastrophe of 1912. For some years past these menaces to N Atlantic shipping have been kept under close observation by vessels specially detailed for this work.

Ice-breaker a special heavy bow plated ship for forcing a way through ice and used especially at ports of the Baltic Sea and the Great Lakes region of Canada which freeze during the winter months. The Soviet atomic ice breaker *Lennin* the first of its kind in the world launched in Dec 1957 is designed to cut a channel through ice of any thickness. Her icebreaking performance will allow the sea route to the north of Siberia to be kept open throughout the year. Icelandic Literature, the Old Norse literature centred about Iceland which includes numerous works of poetry, mythology and history of interest and importance. Much of this literature is in the saga form. See also Edda.

Iceland Moss a kind of lichen (*Cetraria islandica*) which grows in great quantities in the mountain regions of Iceland and other Northern countries. It possesses certain nutritive qualities and is of some value in medicine.

Iceland Spar a colourless form of calcite (calcium carbonate) frequently found in association with metallic ores. It has the power to produce strong double refraction of light so that two images are seen of an object viewed through a piece of Iceland spar. It was formerly used in optical apparatus for producing polarised light. Icelent, an ancient British race who in early times lived in Norfolk and other parts of Eastern England. Their most famous ruler was Queen Boadicea, who led her people against the Romans in A.D. 61.

Ice Plant also called dew plant and diamond plant. A South African mesembryanthemum commonly grown in British gardens. Introduced in 1890.

Ice Saints St Mamertus, St Pancras and St Servatius so called because of the legendary cold on these Saints Days namely May 11-13.

Ichneumon, the Egyptian mongoose, popularly known as Pharaoh's Rat. It is of great use in checking the multiplication of reptiles. It is frequently domesticated.

Ichneumon Fly a numerous group of parasitic hymenopterous insects abounding in many lands and all having the peculiarity of depositing their eggs in the bodies of other insects. It destroys swarms of caterpillars, which become the unwilling hosts of its progeny.

Ichthyology the natural history of fishes.

Ichthyosaurus was a gigantic marine reptile of the Mesozoic age. The fossils are mostly found in the lias formation. Some were over 30 ft.

Icons Icons are religious paintings designed for devotional use either by the individual or in church rituals. In size they range from the very small to large ones in two or three panels on church screens dividing the nave from the chancel (these are known as diptych and triptych respectively). The icon style of painting derives from the tomb paintings of Hellenistic and Roman Egypt, where it had become the custom to leave a portrait of the dead over the mummy's face. Icons of the earlier periods are rare, those of the 6th cent probably having been destroyed and those of the 9th-12th cent. mostly removed to Russia. They were essentially simple with the Virgin and Child, or the Virgin, Christ, and John the Baptist as subject. From the 13th cent. icons were more complex, dealing with New Testa-

ment scenes or scenes from the lives of the saints and by this time schools of painting each with their own style were arising in other countries including Russia which accepted the Eastern Church. The 16th cent icons begin to show Italian influence just as Italian painting was influenced by Byzantine. Most icons were painted on wood but mosaic was sometimes used and some icons were of metal.

Idea in the ancient Roman Calendar the 15th of March May July October and the 13th of all other months always the eighth day after the Nones.

Idiom an expression characteristic of a country district dialect or language which usually gives strength and force to a phrase or sentence. The idiom of a language are its distinctive marks and the best writers are the most idiomatic.

Idris a famous giant belonging to the myths of Wales commemorated by a chair of rock on the top of the Cader Idris mountain in Merionethshire.

Igneous Rocks are such as have been molten under conditions of great heat at some stage in their history. *e.g.* granite basalt. See F8(2).

Ignis Fatuus or 'Will-o'-the-wisp' a phosphorescent light which may often be seen on summer and autumn evenings hovering over marshy ground or graveyards. Its nature is hardly understood though it is generally believed to be the result of the spontaneous combustion of the gases from decaying organic matter. In olden times when marshy grounds were more common than now this dancing light was very frequently visible and was regarded with superstition.

Iguana large South American lizards with a long tail a scaly back and head a thick fleshy tongue and a prominent dew lap in the throat. Specimens of the different species average 4-5 ft in length and they live mostly in trees though they are equally at home on land or in the water. The flesh of some species is good eating as are also the eggs.

Iguanodon a genus of extinct dinosaurs whose fossils are found in the Jurassic and Cretaceous rocks. Iguanodons were 15-20 ft long and walked on their hind legs the front legs being small and adapted for grasping the branches of trees on the leaves of which they fed.

Ilex mentioned by classical authors the holly or holly oak which flourishes round the Mediterranean. To botanists Ilex is the genus to which the holly and mistle plant belong. See T9(2).

Iliad the great epic poem of ancient Greece attributed to Homer (c. 700 B.C.). It consists of ancient folk tale and saga, welded into an artistic unity having as plot the carrying off of Helen by Paris to Troy and the subsequent siege of Troy. See H19.

Illuminated MSS. of great value and beauty of decoration exist in most public museums and in many private collections some of them being of great antiquity especially those of ancient Egypt executed on papyrus. Greek and Latin specimens are also numerous and the British Museum contains fine examples of all these kinds and also an extensive collection of medieval English MSS.

Ilmenite a mineral widespread in igneous rocks chemically it is an oxide of iron and titanium. Rich deposits have recently been found in the Allard Lake area of Quebec the Travancore sands are also a source of ilmenite.

Immortality. See J25.

Immortelles are wreaths crosses, or other designs made from what are called everlasting flowers which are obtained from certain plants of the Composite order and retain their colours and compactness for a long time. Immortelles are largely used as mementoes for decorating graves especially in France.

Impeachment a special arraignment usually before Parliament or other high tribunal of a person charged with some offence against the State. The custom in England was for the impeachment to be made in the House of Commons, and the trial to be before the House of Lords. The first instance occurred in 1376 when Lord Latimer was impeached. With present parliamentary procedure impeachment is no longer necessary since the Cabinet is responsible for the individual actions of its ministers who

acting as a team must carry the Commons with them or resign when it falls to the Leader of the Opposition to form a new Cabinet. Other famous impeachments were those of the Lord High Chancellor Francis Bacon (1621) Earl of Strafford and Archbishop Laud (1640) Warren Hastings (1788) the last being that of Lord Melville (1805). Under the constitution of the United States public officials may be impeached by the House of Representatives and tried by the Senate. The most famous case was that of President Andrew Johnson.

Imperialism. See J28.

Impressionism the name given contemptuously to the first modern movement in painting being derived from the title of Claude Monet's picture *Impression soleil levant* which showed the play of light on water with the observer looking straight into the rising sun. Although intended to be the ultimate form of naturalism the inspiration of the school had been the scientific study of light with an attempt to render the play of light on the surface of objects. Feeling that putting a line around a form was bound to cause it to look unnatural they used bright colours corresponding to the spectrum and unmixed on the palette and noted that an object of any given colour casts a shadow tinged with the complementary one (*e.g.* red green yellow blue). Hence bright sunlight was represented in clear yellows and orange with violet shadows. The first Impressionist exhibition held in Paris in 1874 aroused derision with its paintings by Monet Renoir Sisley Pissarro Cézanne and Degas among others. Impressionism subsequently led to the entirely artistic and anti-naturalist movement of Post-Impressionism. Cézanne who felt that he wanted to produce something solid and durable like the art of the museums was only dubiously impressionist as were also Degas and Renoir. Of course in the wider sense of the word (*i.e.* the recording of an ephemeral impression of a scene) Whistler Turner and even Rembrandt used the technique.

Imprisonment the forced seizure of persons for military service resorted to by many countries before the establishment of conscription. Press gangs forcibly recruited men for British warships especially during the Napoleonic wars but such measures were abandoned after about 1850.

Imprimatur originally an official licence to print and an important formula in the early days of printing. The term is now used in the wider significance of authority or endorsement.

Incas an Indian people who inhabited ancient Peru founded a great empire and reached a high level of civilisation overthrown by the Spaniards in 1533.

Incense an aromatic resinous substance which under combustion, exhales a pungent odour and is used mixed with certain fragrant perfumes, in the celebration of Mass in Roman Catholic churches. Olibanum or frankincense is ordinarily the leading ingredient.

Incisors the sharp edged cutting teeth at the front of mammalian jaws. Rodents have long sharp incisor teeth. Elephant tusks are modified incisors.

Income Tax a tax on annual income charged under the following schedules.

Schedule A—On the beneficial occupation of land (including buildings). Finally abolished as from 1964-65. Rents now assessed under Schedule D.

Schedule B—Abolished as from 1963-64 on amenity lands (parks gardens). Restricted to woodlands managed on a commercial basis.

Schedule C—On dividends interest annuities from public revenue. Income Tax deducted at source.

Schedule D—On profits from trade profession, or vocation remittances from abroad interest on government stocks not taxed at source Post Office Savings etc. sundry profits short term gains rents.

Schedule E—On salaries wages pensions emoluments directors fees etc. Taxed under PAYE.

The income tax year is from April 6 to the following April 5. The standard rate on earnings for 1971-2 is 38.75 per cent (30.14 per cent with earned income relief). *Taxable* income is

found by deducting from *Total* income certain allowances

- (1) *Earned Income* allowance of two ninths to £4 005 and 15 per cent over £4 005
- (2) *Personal* allowance of £825 to single persons and earning wives to married man living with his wife or if wife though not living with is wholly maintained by means of a voluntary allowance £465 If the wife is maintained under a Court Order or under a binding legal agreement the allowance is reduced to £825 Personal allowances for a parent reduced by £42 for each child for whom family allowance is due With effect from 1972-3 a married couple may elect to have their earned income charged to tax as if they were single (Joint income needs to be over £100 a week to bring benefit)
- (3) *Child* allowance of £155 for each child under 11 £180 over 11 and £205 over 16 if still being educated Investment income of minor children (under 18) aggregated with that of their parents (This provision of the 1968 Finance Act to be repealed with effect from 1972-3)
- (4) *Dependent Relative* allowance £75 for single woman widow divorced or separated woman solely supporting dependant relative £110 (Dependant's income limit £289 (£312 for 1972-3))
- (5) *Daughter's Services* necessary owing to old age or infirmity allowance of £40
- (6) *Additional Personal* allowance of £100 to widows and single women (divorced unmarried or separated from husband) who have single handed responsibility for a young child resident with them
- (7) *Housekeeper* allowance of £75 (certain restrictions)
- (8) *Age relief* of two ninths of total income where taxpayer (or his wife) is over 65 and income does not exceed £1 200 Marital allowances
- (9) *Life Insurance* Subject to certain restrictions relief is given for premiums paid for insurance on taxpayer's life or on his wife's life Amount of premium must not exceed 7 per cent of capital sum secured on death nor one sixth of net total income Certain further restrictions on policies taken out after 19 March 1968
- (10) *Retirement Annuity Payments* Subject to certain restrictions a deduction is allowed for payments made for the provision of a life annuity in old age Deduction may not exceed 15 per cent of net pensionable earnings or £1 500 whichever is the less

Age Exemption no tax payable by single persons aged 65 or over if income does not exceed £504 (£580 for 1972-3) £786 (£825 for 1972-3) for married couples where either is 65 or over Appropriate marginal allowances

Pensions qualify for the earned income relief of two ninths

Small Income Relief All incomes up to £450 are treated as Earned Income

Surtax is charged only if the surtaxable income exceeds £2 500 On earned incomes surtax begins at about £5 500 See also Surtax

Note In April 1973 the present income tax and surtax system will be replaced by a single graduated personal tax. This will have a basic rate covering a broad band of income and corresponding to the standard rate less earned income relief (approx 30 per cent) with a supplementary rate for higher incomes

Independence Day commemorates the adoption of the Declaration of Independence on July 4 1776 July 4 is celebrated as a holiday in the US

Index The name given to a list of books, prepared by papal authority which are declared to be dangerous to faith and morals, and therefore forbidden to Roman Catholics called the *Index Librorum prohibitorum*. One of the reforms of the Curia office which judged wrangles for the Church's Index of forbidden books, though the Index itself still remains. The Pope ordered that nothing should be placed on the Index until the author had been given a chance of explaining his views. The first Index was issued by Pope Pius IV in 1559

India Office Library (since 1947 called the Library of the Commonwealth Relations Office (Division B)) This is an orientalist library which specialises in Indian studies It was founded in 1891 by the East India Company and contains 20 000 manuscripts in European languages and in Sanskrit Persian modern Indian and other oriental languages and a quarter of a million printed books of which three quarters are in oriental languages. There are also collections of drawings photographs, and other objects of oriental interest. It was announced in 1965 that a judicial tribunal was to decide on legal ownership of the library

Indian Mutiny This turning point in the history of modern India occurred in 1857-58. The ostensible cause was the serving out to the native troops of cartridges greased with animal fat for contact with this was forbidden both by the Hindu and Mohammedan faiths. A rebel feeling however had long been developing and when the Sepoys at Meerut in May 1857 refused to obey the English officers overpowered and put them to death the mutiny spread like wildfire. The rebels too, Delhi and Lucknow and for many months terrible massacres and atrocities were committed men women and children were slain in thousands. Order was re-established in the autumn of 1858 when the governing power was transferred from the East India Company to the Crown

Indian Summer is applied to a warm spell of weather occurring in the late autumn

Indicators substances which by a marked change in colour are used to indicate the course of a chemical reaction Litmus paper for instance is red with acids and blue with alkalis. In biological work some radioactive substances are used as tracer elements

Indigo the substance obtained from the plant *Indigofera tinctoria* a native of S Asia India being the chief producing country. The colouring matter is the result of the decomposition and fermentation of a glucoside contained in the plant. This is afterwards dried and becomes the caked indigo of commerce. Natural indigo has been eclipsed by artificial indigo a coal tar dye which came into commercial production at the end of the last century which is cheaper and more uniform in quality

Indium a scarce lead coloured metal, symbol In, found in zinc blende in Saxony and certain other ores. This element was discovered in 1863 by Reich and Richter. It is an important material in the manufacture of transistors

Indo European Languages See M45

Indulgence. In the Roman Catholic Church the remission granted by ecclesiastical authority to a repentant sinner of the temporal punishment still due after the guilt of sin has been forgiven by God. The indiscriminate sale of Indulgences by Tetzel and other Papal agents in the 16th century was one of the grievances which led to the Reformation (see J44)

Indulgence Declaration of was the proclamation by which James II suspended the penal laws against Roman Catholics and Dissenters. It was issued in 1688 but the clergy as a body refused to obey and the trial of the Seven Bishops and their acquittal by a jury followed. An invitation was thereupon sent to William of Orange to become King

Industrialisation is simply a name for industrial development. It is customarily used in particular to designate the course of events in a hitherto underdeveloped country which is seeking to increase its wealth and productivity by the introduction of more advanced techniques and by the establishment of industries previously not carried on within it. The word usually covers not only the development of modern industrial production but also the provision of electric power stations, irrigation works and transport and other developments designed to improve production in any field by methods involving large capital investments. The outstanding example in our time of rapid industrialisation has been the Soviet Union, which unable to get the capital from abroad, has had to carry it through by ruthless restriction of the people's consuming power so as to achieve an unprecedentedly high ratio of investment to total production. Industrialisation has in

practice meant a high concentration on the expansion of the basic heavy industries and of power supply coupled with much slower development of the industries supplying consumers goods and of agricultural production but there is no reason why this should always be the case. It may well be that in most under developed countries development can but be devoted largely to the industries making consumers goods and to measures designed to increase agricultural production and productivity.

Industrial Revolution. The name first given by Engels in 1844 to describe the radical changes that took place in Britain during 1760-1840 to transform a mainly agricultural country into one predominantly industrial. It began with the mechanisation of the textile industry (Hargreaves spinning jenny 1764 Arkwright's water frame 1769 Crompton's mule 1770 and Watt's steam-engine 1785) with subsequent major developments in mining transport and industrial organisation. It was based on Britain's rich mineral resources particularly coal and iron ore. With the use of the steam engine as power industry became concentrated round the coalfields and the great new industrial towns developed—Birmingham Manchester Newcastle and Glasgow. Britain became supreme in constructional ironwork (Telford George and Robert Stephenson). Canals bridges railways, and ships were built and great advances were made in the practical application of scientific principles. Aided by colonial exploitation Britain became the most prosperous country in the world. The new industrial capitalists began to replace the country squires as ruling class. But the great accumulation of wealth at one pole of society was matched at the other by poverty and misery for child labour long working hours low wages and slums were features of the industrial revolution in its infancy. As with all great technological developments the industrial revolution produced related changes in all fields of social life—in politics art religion literature and morals and with the rise of democracy social reforms.

Inertia, a term used in mechanics for the property of matter by which it offers resistance to a change in its state of rest or in its state or direction of motion.

Inertial Navigation an automatic method of dead reckoning which at present finds its chief application in guided missiles submarines and aircraft. Navigation by this means is carried out with reference to inertial space (i.e. space which is stationary with respect to the fixed stars) and not to the surface of the earth as in normal navigation (latitude and longitude). This is done by means of high accuracy gyroscopes combined with highly sensitive accelerometers in an apparatus known as the Ship's Inertial Navigation System. The American nuclear powered submarine *Nautilus* pioneered the new north west passage under the polar ice pack by this method of dead reckoning in Aug. 1958.

Inflorescence a flowering shoot. Many arrangements of the flowers are possible and there are many kinds of inflorescence e.g. the spike catkin umbel capitulum (in composites).

Inflation. See G4(2) 37 38.

Intra-red Rays or Radiation. This is the range of rays which come between the visible red rays and the ultra-short Hertzian radiation. The wave lengths involved range from about 0.00076 millimetre (7.600 Angstrom units) to 0.4 millimetre. Infra red rays penetrate haze hence landscapes obscured by haze or cloud can be photographed using plates sensitive to infra-red. Many substances strongly absorb these rays and thereby become hot this happens in toasting bread. Many industries use infra-red lamps for drying paints and lacquers. Very important to chemists as a tool in the investigation of the structure of compounds since various groups of elements absorb infra-red radiation at a characteristic frequency.

Infula, a sacred fillet of woollen material worn on the forehead by priests, magistrates and rulers in Roman times also by persons seeking for protection to sanctuary. Later each of the two lappets of a bishop's mitre.

Ingoldsbay Legends a series of whimsical metrical

tales full of droll humour written by the Rev R. H. Barham and first published in *Bentley's Miscellany* in 1837. The best known is the *Jackdaw of Rheims*.

Ink a liquid pigment ordinarily made from an infusion of nut galls coppers and gum arabic. Shumac is substituted for nut galls for inferior inks. An acid is sometimes added to prevent oxidation and for the blue black inks a small quantity of solution of indigo serves for colouring. Copying ink contains glycerine or sugar which keeps the ink moist. Lampblack used to be the leading ingredient in printer's ink but now new methods of manufacturing have been developed. Marking ink is composed of a solution of nitrate of silver gum ammonia and carbonate of soda. For red blue and other coloured inks colouring solutions are used for example Prussian blue. The earliest examples of ink writing (on wooden tablets) ever found in Britain were recovered from the well of a Roman villa (3rd cent A.D.) during excavations in 1954 at Chew Stoke Somerset.

Ink Sac a glandular organ found in squids and other cephalopods which contains an inkly solution. When roused the animal discharges the contents of the ink sac into the water to make a cloud through which its enemies cannot see. The pigment sepia comes from the ink sac of the cuttlefish.

Inlaying is the introduction of one class of substance into another in some artistic or other design such as silver let into zinc copper or lead and called *badr*, the insertion of gold and silver into iron or steel which is *damascening*, the mingling of brass with tortoiseshell *bull work*, the inlaying of woods *marquetry* of stone *pietra dura* and of the arrangement of small pieces of stone for floors walls etc *mosaic*.

Innocents' Day a festival day in Roman Greek and Anglican Churches in commemoration of the killing of the children of Bethlehem by Herod Dec 28.

Inns of Court the four bodies in London which enjoy the privilege of calling candidates to the bar after they have studied for a certain number of terms and passed certain examinations. The Inns are the Inner Temple the Middle Temple Lincoln's Inn and Gray's Inn.

Inquisition a Roman Catholic ecclesiastical court which became a formidable weapon of the Church in the 13th cent. under Pope Innocent III in dealing with charges of heresy. It was effectively set up in the various Catholic countries of the Continent obtaining its fullest and most sweeping organisation in Spain in the days of Ferdinand and Isabella when Torquemada was made Grand Inquisitor and used its powers with terrible severity. See Auto da fe. In the 18th cent its influence began to wane and the jurisdiction of the Congregation of the Holy Office at Rome was limited to the suppression of heretical literature (see Index).

Insectivorous Plants plants which trap insects with special mechanisms. Plant enzymes or bacteria digest the prey providing the plants with nitrogen usually scarce in the soil in which they grow. The most common British species are the Sun dew and the Bladderwort.

Insects. This huge class of invertebrate animals (see Arthropods (F33)) includes about 100 000 species. Insects are ubiquitous except in the sea only a very few species being adapted to marine existence. Characteristic features are the body is divided into three parts head thorax and abdomen the head carries a pair of antennae the thorax three pairs of legs and usually two pairs of wings. The most primitive insects constituting the sub class *Apterogota* are wingless. The other sub-class *Pterygota* is divided into the *Ecopterogota* (*Hemipterobola*) which have a simple metamorphosis, e.g. cockroach and the *Endopterygota* (*Holometabola*) with a complex metamorphosis, e.g. butterfly bee. Although many are parasitic on man animals and plants, innumerable animals and some plants use them as food and many flowering plants are dependent on a variety of insects for pollination leading to the development of seeds and fruits. See F33(1) 38(2) T28(1).

Insignia, marks or badges of office or honour such as stars ribbons crosses medallions or other

designating objects worn by members of special Orders or holders of prominent offices
Instinct — See F38(1)

Institut de France was formed in 1795 and after various modifications was in 1832 organised on its present basis. Its five academies are—the Académie Française Académie des Inscriptions et Belles Lettres Académie des Sciences Académie des Beaux Arts Académie des Sciences morales et politiques. It is restricted to 40 members.

Instrument. Musical. Musical instruments may be classified in a number of ways but in general they fall into one or three main classes: string Wind and Percussion according to how the sound is produced. **Stringed Instruments** are those which produce the sound by the vibration of a string (a) by plucking as in Harp Lyre Psaltery Zither Lute Guitar Balalaika Ukulele Harpsichord (b) by friction (bowed) as in Cello Violoncello Violin (c) by striking (hammered) as in Dulcimer Pianoforte Clavichord (d) by wind (blown) as in the Aeolian Harp. **Wind Instruments** are those in which the air in the instrument is set in vibration (a) by blowing into a tube (flue voiced) as in Recorder Pandean Pipe Flute O-gan (b) by means of reeds (reed voiced) as in Oboe Clarinet Saxophone Bagpipe Cor Anglais Bassoon Organ reed stops (c) those in which the sound is produced by the vibration of the player's lips against the mouthpiece (lip voiced) as in Bugle Horn Trumpet Tub. **Percussion Instruments** which include the Drums Cymbals Tambourines Castanets.

Insulator a substance that will not conduct electric current. Many solids liquids and gases are important insulators—rubber cotton silk plastic porcelain glass air oil. If the applied voltage is too high all insulators will break down i.e. conduct electricity; perhaps with resulting breakage puncture or charring. Thermal insulators will not conduct heat they are usually the same kinds of substance as electrical insulators.

Insulin is a hormone which controls the supply of sugar from the blood to muscles. The breakdown of sugar provides energy. In diabetes there is a lack of insulin causing a build up of blood sugar which can be released by the injection of insulin. It is secreted by the islet tissue of the pancreas from which it was isolated in 1922 by Banting and Best. Dr F. Sanger of Cambridge won the 1958 Nobel Prize in Chemistry for isolating and identifying its amino acid components. Prof. Dorothy Hodgkin and her team at the Dept. of Molecular Biophysics at Oxford have recently succeeded in determining the structure of insulin a task which would not have been possible without the electronic computer. The discovery may lead to a better use of insulin.

Intaglio engraving or carving on a sunken ground a method frequently adopted in the ornamentation of stones and rings.

Intelligence Intelligence has been variously defined as the innate potential of a person to learn and understand to make appropriate judgments to see the relationships between things to profit from experience or to meet adequately new problems and conditions in life. There are many lines of evidence to show that intellectual capacity is closely related to heredity and influenced by environmental factors. The idea of intelligence testing was first devised by the French psychologist Binet at the beginning of this century. He was asked by the French government to invent a test which would weed out backward children in state schools and thus save public money and avoid holding back the work of the class by teaching children who were incapable of learning at a given standard. Briefly a series of problems are given to a large number of children and it is thus found out which series can be solved by the average child of a given age group. If a child of 7 can only pass the tests suitable to the average child of 6 then his mental age is 6. The intelligence quotient

R 80th Ed.)

or I.Q. is discovered by dividing his mental age by his chronological age and multiplying by 100. A gifted child can usually be spotted at an early age. Although I.Q. tests are the standard method of estimating intelligence they are not universally accepted as a criterion. A teacher's general judgment may be the best assessment. High intelligence may be inherited but fail to develop to the full because facilities for education are not available. Recent research suggests that the growth of the brain may be permanently affected by undernutrition at the time of its fastest growth (the last weeks before birth and to a lesser extent the first weeks after birth). At this vulnerable period even quite minor deprivation can affect the rate and ultimate extent of growth of the brain. This has significance not only for the severely undernourished babies in the poor parts of the world but for babies of low birth weight in our own communities. See also Q28.

Interest is the payment made for the use of borrowed money over time. The rate of interest is the rate per cent per annum charged for such loans. There are many such rates varying with the plenty or scarcity on borrowable money with the length of time for which the loans are made and with the degree of risk if any that the loans will not be duly repaid. Short term loans are usually cheaper than long term. The lowest rates are usually for call money repayable immediately on demand. These are used principally in short term financial transactions such as bill discounting. Bank loans though usually made for fairly short terms command higher rates. Long term loans are made chiefly to public authorities or as bonds or debentures to business concerns. The rates obtained vary with the demand and the supply of such accommodation.

Interferon the name given to a substance discovered in 1967 by Drs Isaacs and Lindenmann at the National Institute for Medical Research. It is produced by the interaction of viruses with living cells and has the important property of inhibiting virus reproduction. Its development may lead to a new approach to the therapy of viral diseases.

International Date Line a line along the 180 meridian marking the difference in time between E and W. For the westward bound traveller crossing the line the date would be put forward one day for the eastward bound, back one day. To avoid difference of date in adjacent land areas the line deviates from the 180 meridian where this crosses land.

Introlit the psalm sung by the choir as the priest approaches the altar to celebrate the Eucharist. **Invention of the Cross** a Roman Catholic festival held on May 3 to celebrate the finding of the alleged True Cross at Calvary by the Empress St. Helena in 328. Also included in the Church of England calendar. See Holy Rood.

Iodine a non metal element symbol I member of the halogen family (qv) a substance formerly exclusively obtained from the ribbon wrack seaweeds. These were burnt and the ashes (kelp) extracted with water. After concentrating the iodides these were distilled with manganese dioxide and sulphuric acid to yield iodine vapour which was condensed in stone ware bottles. Nearly all iodine now in use is derived from the iodine salt present in Chile saltpetre (sodium nitrate). Iodine is used in photography as an antiseptic solution in alcohol or potassium iodide (tincture of iodine) and in medicine. Discovered by Courtois in 1812.

Ionic Order of architecture is one of the five classic orders its leading characteristics being the volute of its capital which has on each side distinctive curved or scrolled ends.

Ionosphere a succession of ionised layers of the earth's atmosphere lying above the stratosphere. In this region free electrically charged particles—electrons and positive ions—occur in sufficient concentration to affect substantially the propagation of radio waves through the region. It extends upwards from a height of 60 miles to several hundred miles being most concentrated at an altitude of 200 miles. The behaviour of the upper atmosphere is strongly influenced by the sun. A great deal of new information about

the ionosphere above an altitude of 150 miles (the topside ionosphere) has been obtained by the use of instruments carried in satellites. *See also Atmosphere*

Ions electrically charged atoms or groups of atoms. Atoms of the metals lose electrons to become positively charged ions e.g. the sodium ion (Na^+) has one electron less than the atom. The non metal ions are negatively charged e.g. the chloride ion (Cl^-) has one electron more than the atom. Similarly a group like the sulphate ion (SO_4^{2-}) has more electrons than the constituent atoms. Thus the hydrogen atom without its electron is a hydrogen ion or *proton* and the helium atom without its two electrons is a helium ion or *alpha particle*. When an electric force is applied to certain solutions the ions into which molecules of the dissolved substance are broken up are attracted to the oppositely charged electrodes their movements constituting an electric current through the solution. In the same way gases including air conduct electricity by virtue of free ions (see F12(2)). Combustion, radio activity and infra violet and cosmic radiations produce ionisation. *See* F20(2)

Ipecacuanha, a flowering plant of the Brazilian forests. Various alkaloids are isolated from ipecacuanha one is emetine which is used in medicine to cause vomiting and so remove poisons from the stomach. Another is used as an expectorant in cough mixtures.

Iridium a white and very hard metal symbol Ir discovered by Tennant in 1804. It occurs naturally as alloy with platinum or osmium tips for fountain pen nibs have been made from the former native alloy. The former standard metre was composed of platinum-iridium alloy (see Metre) as are parts of scientific apparatus and surgical tools that must be non-corrodible.

Iris the typical genus of the botanical order *Iridaceae* with tuberous rhizomes and sword shaped leaves many of the family having beautiful flowers. About 100 species of Iris are recorded from the northern temperate zone the most common species wild in Britain being the yellow flag. Orris root used in perfumery comes from another Iris species.

Iron is a metallic element symbol Fe (Latin *ferrum*) occurring widely in nature in such ores as haematite, lodestone (magnetic iron oxide), sphalerite ore and iron pyrites. It is extracted by a process known as smelting with coke and limestone in a furnace. Its many uses are familiar the most important being in the manufacture of cast and wrought iron products and of steels which are alloys mainly of iron with added carbon and various metals. Iron rust is formed by the action of oxygen and water and is a coating of iron oxide. *See Smelting*

Ironclads, ships of war cased in iron or steel plates of sufficient thickness to resist projectiles. They were first introduced (1858) in the French Navy and in 1860 the first British ironclad the *Warrior* was launched.

Iron Curtain. In a speech at Fulton U.S.A. on March 5 1946 Sir Winston Churchill used this phrase to describe the dividing line behind which he said lie all the capitals of the ancient States of Central and Eastern Europe—Warsaw, Berlin, Prague, Vienna, Budapest, Belgrade, Bucarest and Sofia. These famous cities and the populations around them, said Sir Winston, lie in the Soviet sphere and are subject to a very high and increasing measure of control from Moscow.

Ironsides were Cromwell's special troopers so called because of their solidity and firmness in battle.

Irridentists, a political party organised in Italy about 1878 with the object of incorporating within Italy neighbouring regions. Also a person, group or party advocating policies for the restoration to their country of territory for merely belonging to it but later lost.

Irrigation, an artificial method of providing water for the growth of plants on lands where the natural supply of water is deficient. The science has made immense progress during the last fifty years, and has been the means of bringing into profitable cultivation vast tracts of territory in India and Western America which

had previously been arid wastes. The systems are various and are utilised according to the special conditions of the land to be irrigated but the success which has attended these experiments has been very gratifying. In fact irrigated lands are often more productive than lands which receive a fair amount of moisture from the elements. The irrigation supply can be distributed and regulated exactly according to requirements. Irrigation also serves the purpose of supplying warmth in winter e.g. in the English water meadows and in the more highly developed Italian *marcite* and winter meadows where the water is mostly applied in winter when there is plenty of rain. There are several other functions of irrigation e.g. washing out of excess salts.

Jamglass a gelatinous substance manufactured from the swim bladders of certain fish used to preserve eggs to keep beer free from sediment and to make a glue.

Jalism *See* F28

Isobars are the lines drawn on charts linking together points of equal barometric pressure.

Isoclims lines connecting places at which there is an equal probability of seeing an aurora taking the average over a number of years based on the auroral catalogue of Fritz.

Isomers are chemical compounds having the same composition but different structural arrangements and consequently different physical and chemical properties. For example ethyl alcohol and methyl ether are isomers since the molecules of both are built up of two atoms of carbon six of hydrogen and one of oxygen viz $\text{C}_2\text{H}_5\text{O}$ ethyl alcohol $\text{C}_2\text{H}_5\text{OH}$ and methyl ether CH_3OCH_3 .

Isotherms are lines drawn on charts through points of equal temperature.

Isotopes. When one talks of an element say uranium or lead the name of the element is a generic name for a collection of uranium species and lead species. The different species are called isotopes. For any particular element the number and arrangement of electrons around the nucleus are the same in all the isotopes so all the isotopes have the same chemical properties. Soddy has described isotopes as elements the atoms of which have similar outside but different insides. For example in the nucleus of the uranium isotopes U 235 U 238 and U 239 there are respectively 143 146 and 147 neutrons but all have 92 protons. The isotopes have different atomic weights in this instance respectively 235 238 and 239. But all have the same chemical properties. *See* F10(3).

Ivory, the dentine substance of which the tusks of the elephant, hippopotamus, walrus etc. are composed. The tusks of the African elephant sometimes weigh as much as 100 lb. and reach a length of 8 or 9 ft.

Ivory Gull, a small beautifully shaped sea-bird with striking all white plumage and black legs which breeds on the rocky shores of the Arctic being found farther north than any other bird. It occasionally wanders south in the winter.

Ivy the well known climbing shrub chiefly evergreen furnishing a sudorific the berries having also emetic properties.

J

Jabiru the Brazilian name for the giant stork of South America.

Jacamar, from *Jacamer* the Brazilian name for a smallish bird with long sharply pointed bill and brilliant plumage which inhabits the tropical regions of South America east of the Andes. These birds are seen sitting motionless on trees darting off at intervals like flycatchers to catch insects on the wing.

Jacana, a tropical bird (the water hen of Brazil and the warmer parts of America) of wide range, beautiful of plumage with slim body and narrow wings and long pointed beak. It feeds on seeds and insects inhabits marshy lands and is related to the plovers.

Jack, a small schooner rigged vessel used in the Newfoundland fisheries a pike an oscillating lever a device used in roasting meat.

Jackal *Canis aureus* a small wild dog related to the wolf and resembling a fox. The Common

Jackal is found in SE Europe India and Ceylon other species inhabit Africa and Egypt The jackal is a well known scavenger It hunts singly or in pairs unlike the wolf which usually hunts in packs

Jackdaw one of the smaller members of the Crow family This European bird is typically black with grey collar It is easily tamed makes an amusing pet and delights in making off with and taking to its nest bright objects such as silverware

Jacobins a French revolutionary club or party formed in 1793 and accustomed to meet at a Jacobin convent hence the name It became a controlling force in the Revolution especially in the movement which led to the Terror Robespierre was its chief spokesman

Jacobites adherents of the Stuart cause after the abdication of James II First James himself then his son (the Old Pretender) and later his grandson (the Young Pretender) tried to fan the flame of rebellion in Scotland and Ireland but after the defeat at Culloden in 1746 the cause was lost Also the name of the monophysite heretics of Syria (see Section J) so named after their leader Jacobus Baradaeus in the 6th cent AD

Jade a green mineral found in China America and New Zealand and used for making vases bracelets and other ornamental articles There are many varieties and there is evidence that the stone was in common use in prehistoric times for weapons and utensils

Jaguar a South American carnivorous animal resembling the leopard but much larger and more powerful the largest of the Felidae

Janette a devotee of Jane Austen and her writings

Janissaries an élite band of Ottoman foot soldiers who acted as the Sultan's bodyguard They were conscripts raised by the tribute of children from conquered Christian countries mainly Serbia and Albania First recruited under Murad I (14th cent) They were not allowed to marry They gained great power under the Ottoman Empire In 1826 the Sultan Mahmud II had them massacred

January the first month of the year named after Janus the two faced god of the Romans It was the *Wolf month* and *After Yule* of the Saxons

Jasmine a graceful climber belonging to the olive family with odiferous blossom originally a Persian plant but now acclimatised in many varieties in almost all parts of the world Two species of jasmine (the common jasmine and the Spanish jasmine) yield oils used in perfumery

Jasper a precious stone of the chalcedony variety opaque and coloured red brown yellow and sometimes green It was greatly esteemed by the ancients the Bible having numerous allusions to it

Jay, a gaily-coloured bird of the Crow family of many species—the Blue jay of N America the Canada jay sometimes called whiskey jack the Siberian jay and the British jay fawn coloured with black and whitish crest and bright blue feathers in the wings It lives in woods and like the magpie takes the eggs and young of small nesting birds

Jazz, a rhythmical syncopated music characterised by a strong element of improvisation in the performance probably originating among the Negro population of the Southern States of the U.S.A. It became popular during the first world war and in a commercialised form has held the popular field ever since Modern dance music and popular songs are based on the jazz idiom which has also had a profound effect upon contemporary music of a more serious kind

Jean a stout kind of twilled cotton cloth much worn in olden times and resembling fustian Blue jeans adopted by American city youngsters from farmworkers are now the fashion elsewhere and worn not only as overalls by workmen but by both sexes in leisure time

Jelly-fish. The jelly fishes which have gelatinous translucent bodies fringed at the margin with delicate tentacles constitute the coelenterate order *Scyphozoa* The mouth with a squarish opening is seen on the underside and there are four horseshoe-shaped sex organs

Jerboa, small jumping mammals of the Rodent

order These mouse like animals have long tufted tails and very long hind legs the front legs not being used for locomotion

Jeremiad any utterance or writing in which sorrow or complaint is the chief characteristic so named as recalling the style of the Lamentations of Jeremiah in the Old Testament

Jerusalem Chamber a room in Westminster Abbey deriving its name from the circumstance of its having originally been decorated with a view of Jerusalem Henry IV died in this chamber and the Committee for the Revision of the Bible met there in 1870 and later

Jesuits members of the Roman Catholic te chng order founded by Ignatius Loyola in 1534

A long and vigorous course of study is prescribed before they are admitted into the privileges of full membership They are required to take the vows of voluntary poverty perfect chastity perfect obedience and complete submission to the Pope The Society played an important part in politics

Jet a deep black fossil substance admitting of a high polish and much used for jewellery ornaments and trumming It is a form of lignite the most important British deposit being found near Whitby where jet manufacture has been an established industry for a long period

Jet Engine an aeroplane engine which derives its thrust from the high velocity of the gases it ejects The essential units in a jet engine are a rotary compressor and a gas turbine the latter driving the compressor The first reliable high performance jet propulsion engine for aircraft was invented by Air Commodore Sir Frank Whittle

Jet Stream, a meteorological term coined in 1946 to describe the relatively narrow belt of strong winds (100-200 m p h) at levels in the atmosphere from 3 to 7 miles These winds are important in forecasting weather and can be a valuable aid to aircraft From the ground where there may be little wind the jet stream can sometimes be seen as high cirrus cloud moving across the sky at high speed

Jew's Harp The name is believed to be a corruption of jaws harp This instrument consists of a metal frame with a central tongue of spring steel The frame is pressed against the teeth and the tongue of the harp is twanged with the finger the mouth acting as a resonating chamber By altering the shape of the mouth the resonant frequency and therefore the note can be varied

Jockey Club the governing body that although possessing no legal status frames rules and laws by which horse racing and turf matters generally are regulated. The club house is at Newmarket

John Bull the typical figure of an Englishman bluff big and burly Arbuthnot's *History of John Bull* is supposed to have originated the character

John Dory a fish found in most temperate seas and common in British waters It is of a golden yellow colour (*jaune doré*) has a high dorsal fin with long filaments projecting from the spines, very protractile jaws and is much valued as a table fish According to legend the dark spot on each side of its body is the thumbprint of St Peter who took a coin from the fish's mouth (Matt XVII 24-7)

John o Groat's House W of Duncansby Head Caithness popularly named as the northern most point of Scotland According to legend the house which has now disappeared was built in octagonal form by a Dutchman Jan de Groot who came to live there in the 16th cent The site is marked and an inn was erected near it in 1876

Jongleurs were minstrels and jesters who wandered from town to town singing songs playing musical instruments dancing and giving entertainments in medieval France and Norman England Jongleurs were low born in contrast to the Troubadours who were often of the nobility

Joule a unit of energy in the SI system of units defined as the work done when the point of application of a force of one newton is displaced through a distance of one metre in the direction of the force Named after J P Joule (1818-89). The relationship between mechanical energy and

heat energy is called the mechanical equivalent of heat and was found by Joule to be 778 ft lb in lb °F units or 4.18×10^7 ergs in gram C units. See F17.

Jousts were military tiltings in the nature of tournaments where the contestants strove against each other on horseback with blunted lances. It was the sport of nobles in feudal times.

Judaism. See J27.

Julian Calendar named after Julius Caesar who in 46 B.C. finding the Roman year 90 days in advance of the real time was the first to adopt the calculation of time by the solar year. The average length being fixed at 365½ days. There was still an overplus of a few minutes every year and this was rectified by the Gregorian Calendar introduced in Italy in 1582 and adopted in England in 1752 from which date what is called the New Style begins.

July the seventh month of the year named after Julius Caesar. It was the *Maced month* (Mead month) of the Saxons.

June the sixth month of the year containing 30 days and deriving its name from Juno. It was the *Ser* (Dry) month of the Saxons.

Jungle-Fowl birds related to the peacocks and peacock pheasants. At least four species are known from the jungles of India, Ceylon and Java. The domestic chicken has been derived from the Red Jungle Fowl (*Gallus gallus*).

Junkers name of the ruling class of Prussia, military in spirit who were the party of reaction and defenders of the landed interests.

Supported Bismarck prior to the Franco-Prussian war and helped bring Hitler to power.

Jupiter the largest planet. It is believed to have a rocky core surrounded by ice layers thousands of miles thick. There is an outer atmosphere containing ammonia and methane, both presumably in the liquid or solid state owing to the very low temperatures of the outer layer: (-120 °C). In 1610 Galileo made history by discovering the four major satellites of Jupiter which he named Medicean planets after his patron Cosmo Medici; these are visible with good field glass. There are eight others.

For distance of Jupiter etc. see F7. Also the supreme mythical deity of the Romans identified with the Greek Zeus (F38).

Jurassic Formation, a series of rocks (the evidences of which are most marked in the Jura Mountains) coming between the Cretaceous and Triassic groups and including the Oolite and the Lias. It is a formation rich in fauna abounding in echinoids, lamellibranchs, ammonites and bivalves.

Large reptiles, marine and land, are common as are the plants called cycads. In Britain the Jurassic outcrop extends from the Dorset coast to the Yorkshire moors. See F44.

Jury a body of private citizens chosen and sworn to hear and pass verdict upon evidence brought forward at a trial inquest or inquiry. The origin of the English jury is obscure but it is thought to have been introduced by the Normans. The jurors are the sole judges of the true facts upon the evidence laid before them. Under the Criminal Justice Act of 1907 their verdicts in criminal courts in England and Wales no longer have to be unanimous but by a majority of 10 to 2. In Scotland 45 jurors are summoned in criminal cases, of whom 15 are chosen by ballot, and majority verdicts are accepted not guilty not proven, and guilty.

Jute, the name given to the fibre of a plant grown largely in Pakistan in the Ganges delta and used for the manufacture of coarse cloths, cordage, and sacks. Calcutta is the biggest jute manufacturing centre of the world, as Dundee was in the 19th cent.

Jutes, a Low German race who in the 5th cent. invaded the south-eastern part of England establishing themselves in Kent and making Canterbury their capital.

Juvenile Courts—This is a special kind of Magistrates' Court to deal with accused persons under the age of seventeen. The Magistrates chosen are specially qualified for the work, and where possible a woman is appointed as one of the Magistrates who constitute the Court (see D6). The Court is held in private away from the ordinary court room. The object of the Juvenile Court is to introduce into the trial a plan to reform the offender by providing for the care

and protection which he may need by removal from undesirable surroundings and by subsequent education or training. In these objects the Court has the co-operation of social workers including Probation Officers (7c). Radical changes in methods of preventing and treating juvenile delinquency are contained in the Children and Young Persons Act 1969, the result of the findings of two White Papers 1965 and 1968. They emphasise the necessity of helping and supporting the child as far as possible in his own family and community with resort to formal procedures only where he is exposed to moral danger or control is necessary in the interest of society or of the child. The 1969 Act will be phased into operation and the Government have stated that initially children may continue to be prosecuted. The minimum age for prosecution will be raised to 12 when the Government is satisfied that local authorities and other services have the necessary capacity to cope with this change. Children who are below prosecutable age will be dealt with by social casework or by care proceedings. Although the Act places restrictions on the prosecution of 14 to 17 year olds so that prosecution would be restricted to categories of offences to be prescribed and only if action by other means were inadequate the Government have announced that they do not intend to bring these provisions into operation.

K

Kakapo the Maori name for the New Zealand owl parrot, a peculiar and interesting species possessing wings but not able to use them for flight (though it can glide) of sap green plumage nocturnal in its habits and nesting in burrows. Still to be found in the larger forest areas of the South I.

Kangaroo pouched (marsupial) mammals of Australia and adjacent islands. There are over 20 species, the smaller ones being known as wallabies. Kangaroos leap in a succession of spry bounds 10-20 ft. long the forefeet not touching the ground. They can reach a height of over 6 ft. and a weight of 200 lb. First seen by white men when Capt. Cook's expedition visited Australia in 1770. Related genera include the tree kangaroos of New Guinea and the Tasmanian Jerboa kangaroo.

Kaolin or **Kaolinite** a fine clay much used in the manufacture of high class pottery. It results from the decomposition of felspar and is found in China, Japan, Devon, Cornwall, at Limoges in France and in parts of the United States.

Karst, geological formations typical of limestone regions in which the drainage is by underground channels. Rain water carries part of the limestone away in solution leaving the surface dry and barren and pitted with innumerable hollows. The name comes from the Karst (Slav Kras) region of N.W. Yugoslavia where the rocks are massive pure limestone the barren plateau is characterised by fissures, caves and subterranean rivers.

Katydid large long horned insects of the grasshopper family common throughout the United States east of the Rockies. Their name comes from the sound these insects make.

Kauri Pine a large coniferous tree yielding a fine copal resin which ranges from Malay to New Zealand. The New Zealand Kauri *Agathis australis* is found only in the N. Island. Some of the best Kauri gum comes from fossilised pines and is dug out of the soil far from any living trees.

Keep the central tower or chief stronghold of an ancient castle, sometimes called the donjon.

Kelvin Lord Kelvin, an important 19th-cent. physicist gave his name to the kelvin symbol K, a measure of temperature on the absolute scale ($q v$). The Kelvin scale is a development of the scale invented by Celsius ($q v$) for every day use long known as the centigrade scale, the degree interval on both scales is the same.

Kentish Rag, a fossiliferous clayey limestone of Cretaceous age found in Kent. Used in building.

Keratin, a hard protein material of which horns, nails, claws, hoofs and reptiles scales are made.

Kestrel the most common British falcon well known for its habit of hovering for minutes at a time with vibrating wings and then swooping down to attack mice and insects. The male has spotted chestnut brown back greyish head and tail which has a broad black band near tip.

Ketones. A class of organic compounds related to aldehydes of general formula R_2CO (where R is an organic radical). The simpler ketones especially acetone are widely used as solvents for lacquers synthetic rubber and polymers such as cellulose acetate and perspex. More complex ketones occur in nature and some are used in the perfumery industry muscone (from the musk deer (*q.v.*)) is an example.

Kew Gardens officially known as the Royal Botanic Gardens are among the most celebrated gardens in the world. They were started in 1759 by Princess Augusta of Saxe-Gotha widow of Frederick Prince of Wales and mother of George III. They remained private property until 1841 when control passed to the Commissioners of Woods and Forests. They now cover 300 acres and are administered by the Min. of Agriculture Fisheries and Food. Since 1841 the gardens have been open to the public and form one of the most attractive resorts near London.

Keys House of the Manx representative assembly. See Tynwald.

Keystone the stone which occupies the centre and highest point of an arch and is usually the last to be inserted.

Khaki a clay coloured cloth adopted for uniforms in the British Army in the time of the war with the Boers and used in the first and second world wars. First used by Indian regiments.

Kilderkin, once a common liquid measure in England representing 18 gallons.

Kilogramme unit of mass defined as the mass of the international prototype kilogramme of platinum-iridium kept at the International Bureau of Weights and Measures at Sèvres. A new determination of the imperial standard pound in terms of the international kilogramme was made recently by the National Physical Laboratory. (1 international pound = 0.45359237 kilogramme).

Kilowatt Unit of power equal to one thousand watts. See Watt.

Kinetic Energy the energy (*q.v.*) possessed by a particle or body in virtue of its motion. If the motion is destroyed *e.g.* by the impact of the body with an obstacle the kinetic energy vanishes being turned into some other form of energy such as heat and sound. If the body has mass *m* and speed *v* its kinetic energy (leaving out corrections due to relativity) is $\frac{1}{2}mv^2$.

Kinetic Sculpture a development of equipoised sculpture (*i.e.* sculpture independent of gravity) in the sense of resting on a base either horizontally vertically or obliquely) intended to appear as a weightless posing of volumes, relationships and interpenetrations. Since in the literal sense this is impossible the Constructivists (Fevner Gabo and Moholy Nagy) used glass and invisible wire as supports giving the impression that their creations were in fact independent of gravity. However the American, Alexander Calder has made constructions of balls and wire which he calls mobiles and in this form they are now known to everyone as they delicately dangle and rotate suspended from the ceiling.

King Crab remarkable arthropods now classified separately from both Arachnida and Crustacea which they resemble inhabiting the sea coasts of America, Japan, India and Malay. They carry a shield shaped shell and having a long pointed spine projecting from the posterior. The body comprises three separate sections articulated together. These crabs—in America known commonly as the horseshoe crab because of their shape—are from 18 in. to 2 ft. in length. Fossil king crabs are found as far back as the Silurian. There are about six living species.

Kingfisher a well known family of brilliant-plumaged birds found in all continents containing some 250 species and sub species. The British kingfisher *Alcedo althys* haunts the rivers and streams, and is one of the most

beautiful of native birds, having iridescent blue-green white and rich chestnut in its plumage and bright red feet. All kingfishers have long dagger shaped bills. In the Malayan region New Guinea the Moluccas and Australia the varieties are very numerous. The quaint *Laughing Jackass* of Australia is among the largest of the kingfisher family. The European kingfisher is the bird of the Greek legend of the Halcyon.

King-of-Arms the name of the chief officials of the Herald's College. There are several in England—the principal being those of the Garter, Norroy and Ulster Clarenceux. See Herald's College.

Kiosk a word of Russian or Turkish origin meaning a small open pavilion of light construction much used in Eastern countries as a place of shade and rest. Similar structures are common in the streets of Paris as news and advertisement stands and in London as telephone offices.

Kirimon (*Kiri no oo Mon*) and **Kikumon** (*Kai no oo Mon*) the two Japanese imperial crests the first a design of leaves stems and flowers of the Paulownia plant, and the other representing the sixteen petalled chrysanthemum.

Kite name of several birds of prey widely distributed related to the hawks and eagles graceful in flight and distinguished by their long wings and deeply forked tails. The red kite, high chestnut brown once the most familiar bird of prey in Britain seen scavenging the streets of London is now the rarest and found only in Wales. The Egyptian kite and the Arabian kite of India notorious for their daring thefts are closely related to the black kite, a smaller European species with less forked tail and blackish brown plumage.

Kittiwake, a beautiful white and pearl grey gull with black legs dark eyes and greenish yellow bill. Its range is wide and includes the British Isles where it is a local resident. The flight of this only truly oceanic gull which excepting in the breeding season is generally found off shore is graceful swift and buoyant. A triangular black patch noticeable on the end of the wings when open, is characteristic of the species as is the call kittiwake from which the bird derives its name. It nests in colonies on the ledges of caves and steep cliffs.

Kiwi flightless stoutly built birds of New Zealand now very rare and carefully protected by the Government. They are little larger than a domestic hen and lay astonishingly large eggs for their size. Incubation and care of chicks fall to the male bird. They have rudimentary wings concealed by the plumage and the feathers are hair like. They are nocturnal in habit.

Knighthood is a degree of honour or title common in Europe since the Middle Ages and was at first exclusively a military order. In Great Britain the four main orders of knighthood are those of the Garter the Bath the Thistle and St Patrick in addition to which there are several other orders such as the Order of St Michael and St George the Star of India etc. There are also Knights Bachelors such as are not associated with any special order. The title is not hereditary and therefore ranks below that of a baronet though both are entitled to the prefix Sir.

Knot a nautical measure of speed (1 sea mile per hour) and formerly measured by a log line divided by knots at equal distances $\frac{1}{10}$ of a geographical mile. The number of knots travelled by the ship in half a minute corresponded to the number of sea miles it travelled per hour. A sea mile is equal to about $\frac{1}{16}$ of a statute mile. Also a grey and white wading bird, usually a winter visitor to Britain found in flocks on the coast.

Knout, a whip of many thongs, often fatal in its effects formerly used in Russia for flogging criminals.

Koala, the Australian arboreal marsupial mammal that looks like a toy teddy bear with ashy-grey fur bushy ears, and rudimentary tail. It feeds on the leaves and shoots of certain eucalyptus trees, and is not more than 2 ft. in length.

Kohl, a powder prepared from antimony or burnt almond shells, and in common use by the women of the East for darkening the eyelids.

Koto, a musical instrument in general use in Japan consisting of a series of 13 silken strings stretched

across a curved wooden surface and played with the fingers. Each string is 5 ft long and has a separate bridge so fixed as to give the vibration necessary for the note it has to produce. It is a sort of horizontal harp and in the hands of an expert player is capable of giving forth excellent music.

Kremlin, the citadel or walled city within a Russian city which during the Middle Ages served as an administrative and religious centre and offered protection. That of Moscow now the headquarters of the Russian government contains the cathedral where the Tsars were crowned an imperial palace and the bell tower of Ivan the Great. Its walls which are topped with towers were built in the 15th cent.

Krypton, one of the rare gases symbol Kr occurring in the air to the extent of 1 part in 20 million. It was discovered in 1898 by Ramsay and Travers. It is used in gas filled electric lamps.

Kusti the sacred cord or girdle of the Parsees consisting of 72 threads—the number of the chapters of the *Izashue*—and two branches each branch containing six knots together standing for the 12 months of the year.

Kyrie Eleison (Lord have mercy) the name of a common form of prayer in the Anglican Roman Catholic and Greek Churches also applied to the English Church responses after the recital of the commandments.

Kyrie Society named after Pope's Man of Ross John Kyrie founded by Miss Miranda and Miss Octavia Hill in 1875 and having for its object the decoration of workmen's clubs hospitals etc and the promotion among the poor of a taste for literature music and outdoor recreation.

L

Labarum the standard of Constantine the Great adopted after his conversion to Christianity marked with his seal and represented upon the coinage.

Labourers' English Statute of 1850-51 with the object of compelling labourers to accept a certain rate of wages and not leave their employers service the *Plague* having rendered labourers so scarce that they were in great demand and had been insisting on higher pay. These enactments were bitterly opposed and led to the Peasants Revolt headed by Wat Tyler.

Labradorite a felspar rich in calcium and of a pearly lustre on cleavage found in masses in igneous rocks the best samples of which come from Labrador.

Labyrinth, or *Maze*, a combination of roads and passages so constructed as to render it difficult for anyone ignorant of the clue to trace the way to the central part. The Egyptian labyrinth near Lake Moeris had 3 000 rooms half of them subterranean and the remainder above ground. The labyrinth in Crete according to Greek myth was built by Daedalus to house the Minotaur. There was one at Lemnos renowned for its stalactite columns and another at Clusium constructed by Porcenna King of Etruria about 520 B.C. The labyrinth in which Fair Rosamond was concealed was at Woodstock. Hampton Court maze dates from the 16th cent.

Labyrinthodonts, gigantic fossil amphibians which get their name from the curious labyrinthine structure of their teeth probably an evolutionary link between fishes and reptiles. They occur in the Carboniferous Permian and Triassic formations and remains have been found in Britain and other parts of Europe. Their heads were several feet long and their footprints, by which they were discovered, closely resemble the prints of the human hand.

Lac, a resinous matter deposited on the branches of a number of tropical trees by the females of the lac insect the excretion including eggs and a viscosus covering. At the gathering time the twigs are broken off and dried in the sun when the insects die and the lac that remains is termed *stick lac*. From this, by the removal of extraneous accretions and dissolving *seed-lac* is produced. *Shell-lac* is seed-lac after it has been melted and otherwise prepared and this is the best known of the lacs, being used in printing and the manufacture of varnishes

and sealing wax and for other commercial purposes.

Lace a delicate fabric of linen silk or cotton threads made by hand or machinery and worked in various ornamental designs. The kinds of lace are many deriving their distinctive names either from the method employed in production or from the place where any special variety was originally made. The best known makes are pillow or bobbin lace woven and plated by hand needle point lace worked by the needle over a traced design and machine lace which practically dates from Heathcote's invention of the early part of the 19th cent. Some of the most famed laces are the following: *Alençon* a needle point lace *Brussels* a very fine kind with needle point sprigs and flowers *Chantilly* a silk variety with flowers and open work *Cluny* a netlace with darned stitch *Honiton* a delicate kind with dainty sprigs and figures *Mechlin* generally made in one piece and very varied in design and *Valenciennes* or bobbin lace of great durability the pattern and ground of which are made at the same time being one of the best and most costly of laces now manufactured mainly in Belgium. Nottingham is famous for its lace.

Lace Wings insects with frail transparent and much veined wings whose grubs eat large numbers of insect pests such as aphids. The eggs are borne at the ends of threads attached to plants.

Lachesis a genus of venomous snakes of the rattle snake family confined to tropical countries and including the deadly bushmaster of Surinam and several *Crotalidae* pit vipers of Guiana and Brazil.

Lacquer a varnish made from shellac and certain colouring matters and utilised for imparting lustre to various surfaces of metal or wood. In China and Japan the production of lacquer ware of a decorative character has long been an important industry bringing into use gold coral vermilion sprinkled and other lacquers with pleasing effect.

Ladybird the common name of a large family of beetles—the *Coccinellidae*. The insect is usually of a red or yellow colour with small black or coloured spots. Ladybirds are of good service to the gardener because their larvae feed on aphids. There are about 2 000 species.

Lady-Day the day of the festival of the Annunciation of the Virgin Mary Mar 25. One of the four English quarter days.

Lagoon a stretch of shallow water opening out upon the sea. Venice is built on lagoons.

Lake Dwelling the name given to certain prehistoric habitations which were thought to have stood on platforms over lakes like villages in certain Pacific islands. Recent excavations at the Lake of Burgäsch in Switzerland show that the prehistoric Swiss pile dwellings probably stood on the shores of lakes not on platforms over the water.

Lakes are bodies of water collected in depressions of the earth's surface. The most notable lakes are the Great Lake series of North America including Superior Michigan Huron Erie and Ontario all discharging into the St Lawrence River. Africa has an enormous area of lakes including the Albert Nyanza and the Victoria Nyanza forming the sources of the White Nile. Lakes Tanganyika Nyassa Tchad etc. Smaller lakes are numerous in other countries—Switzerland Germany Italy England Ireland Scotland all having their lake regions where the scenery is invariably beautiful and romantic. *Lake School*, the name given at first in ridicule to a distinguished trio of poets—Wordsworth Coleridge and Southey—who made their homes in the English Lake District.

Lamellibranchs (Pelecypods) the class of aquatic bi-valve molluscs to which the oysters cockles mussels, clams and scallops belong. In these animals the body which is compressed laterally is enclosed in two hinged shells held together by muscular action. The gills are thin plates hence the name lamellibranch. See F33(1) 33(2).

Lamination, stratification on a very fine scale as in shales.

Lammas Day is one of the oldest of the Church festivals probably derived from the loaf mass

(blatfinesse) of the Anglo Saxons. It occurs on August 1. In the olden time it was the day when leave were given in place of first fruit offerings.

Lammerfeyger the bearded vulture of alpine regions resembling an eagle in appearance. It has a white head with black tufts at base of the bill and its general plumage is dark brown nearly black. It is found in the remote mountain ranges from Southern Spain to China and is becoming scarce.

Lampblack a carboniferous pigment obtained from flame smoke and now produced in specially constructed furnaces in which bodies rich in carbon such as tar or petroleum etc. are burned. The smoke or soot resulting is collected from the sides of the furnace and forms lampblack. It finds use in making printer's and black paint etc. Being a very pure form of carbon it is also utilised in the manufacture of dynamo brushes and arc lamp carbons.

Lamprey Eel like fish having no scales bones paired fins or jaw. They attach themselves by their mouths to fish whose blood they suck. Together with the hagfish the lampreys are placed in a special class—the Cyclostomes. There are three British lampreys.

Lancelotti S. Amphioxus.

Lancet "the name of a noted English medical journal" as published in 1824 by Dr. W. G. Jackson.

Land Crab a family of crabs (*Gecarcinidae*) which live mainly on land though migrating to the sea to deposit their eggs.

Land League an association formed in 1879 with Parnell as president for compelling a reduction in the rents of land and a reconstruction of the land laws in Ireland and in case of non compliance refusing to pay rent. For a time this League exercised great political influence and was an important aid to the Home Rule agitation.

Landrail popularly known as the Corncrake was a regular summer visitor to Britain two generations ago but no longer. Its harsh and piercing note was a familiar sound in English cornfields. Still found in Ireland.

Landship a sudden downward sliding under gravity of large masses of rock soil etc. often set off by earthquake shock or saturation of a particular stratum with water. Many serious landslides have occurred from time to time. In 1618 an earthquake happened at Plurs on Lake Como involving the destruction of many buildings and the loss of numerous lives. In 1806 a portion of Rossberg mountain in Switzerland slipped from its position and falling into the valley below buried many villages and hamlets and over 800 people. A chalk cliff from 100 to 150 ft. high and three quarters of a mile long fell at Lyme Regis in Dorsetshire in 1839 doing great damage. Over 200 people were killed by a landslip in Naini Tal in India in 1880 and at Quebec in 1889 a rocky eminence called Cape Diamond gave way many buildings being destroyed and lives lost. Notable landslides in recent times have occurred at Amalfi (Italy) in 1824 at Murchison (New Zealand) in 1929 and near St. Gervais (France) in 1970.

Langue d'oc and **Langue d'oïl** the two principal medieval French dialects *oc* and *oïl* being their respective words for the affirmative particle (modern French *oui*). **Langue d'oc** spoken south of the Loire was the language of the troubadours. Provençal one of its dialects had a literary revival in the 19th cent. under the influence of the poet Frédéric Mistral. **Langue d'oïl** was spoken in northern France and it was the dialect of the Paris region which developed into modern French.

Lantern Fly bugs belonging to the family *Pulgoridae* in which the head is drawn out to form a lantern like structure. In no instance is used to think it was.

Lantern or England Bath Abbey possesses so many windows that it is called sometimes the Lantern of England. Among numerous interesting monuments Bath Abbey contains that of Malthus author of *Essay on Population*.

Lanthanum a metal belonging to the rare earth group of metals discovered by Mosander in 1839.

Lapis Lazuli an azure blue mineral being a silicate of aluminium and sodium. The pig-

ment ultramarine is made by grinding it though artificial ultramarine has largely superseded it. The mineral (also called *lazurite*) has been used as a gemstone since ancient times.

Lapwing or Green Plover familiar British bird on moors and marshlands with iridescent greenish black plumage white underparts and black crest. Often called peewit from its cry.

Larboard L. the old nautical term indicating the left hand side of a ship and changed by Admiralty order to port in 1844. Starboard is the right hand side.

Larch a familiar coniferous tree in the mountain regions of northern Europe and though not native to Britain the Common Larch is now fully cultivated in various parts of the kingdom. It is one of the best or all turpentine yielding trees and the bark is valued for tannin. The larch is an unusual conifer in being deciduous.

Lark a bird of the *Laridae* or gull family.

Lark a family of song birds (*Laudidae*) or many species some of which—notably the skylark—are famed for their habit of soaring into the air singing all the while. They build their nests on the ground in the open country and except for the black lark of Russia have a rufous brown plumage. The skylark and wood lark are the best known British species while the bush lark and shore lark are among the occasional visitors. Africa has the greatest number of larks. America has only one species the horned lark.

Larkspur the common name of the genus *Delphinium* a favourite flower introduced into British gardens from Switzerland in 1573. The common larkspur is *D. consolida*.

Larva the undeveloped form of any animal which before maturity undergoes metamorphosis usually different from the adult in structure and habits.

Laser A remarkable kind of light source that was discovered in 1960. With the laser it is possible to probe the behaviour of matter under the influence of enormous energy densities range and survey vast distances to microscopic accuracy and send millions of telephone and television messages between any two points that can see each other with telescopes. Laser light in contrast to natural light is coherent and can be expressed as a regular progression of waves carrying energy along a particular path. Thus the essential difference is that laser light is an orderly sort of wave motion in contrast to ordinary light which is inherently unstable and therefore an inefficient carrier of information in time. The name *maser* which is the microwave parent of the laser derives from the expression microwave amplification by the stimulated emission of radiation. Upon application to light wavelengths the microwave part of the name lost its meaning and the term maser became generally descriptive of any device in which stimulated emission dominates.

Latent Heat is the quantity of heat required to convert 1 gram of a substance from one form into another. For example when a solid changes into a liquid or a liquid into a gas; the addition of heat to bring about the change produces no rise in temperature the energy being absorbed in the form of latent heat. An equal amount is released when the process is reversed. The latent heat of fusion of ice is about 79.6 calories per gram that of the vaporisation of water about 539 calories per gram.

Lateran Councils were the religious conventions held in the Lateran basilica at Rome for deciding important questions of Church doctrine. The most brilliant was that of 1215 which pronounced in favour of a Crusade. See Ecumenical Councils.

Laterite a residual deposit formed in the tropics by weathering and decomposition of igneous rocks. It consists mainly of hydrated ferric and aluminium oxides and is difficult to cultivate.

Latin America The Spanish speaking Portuguese speaking and French speaking countries of N. America S. America, Central America and the W. Indies. See K93.

Latitude of a point on the earth's surface is its angular distance from the equator measured

on the surface of the earth in degrees minutes and seconds. Thus the equator is 0° Lat and the poles 90° Lat (N or S). First determined by Hipparchus of Naxos about 100 B.C.

Laughing Gas See Nitrous oxide

Launce or Sand Eel A family of eel like sea fishes found in large numbers on the coasts of North America and Europe. There are two species common to British waters. These fishes are of a bright silvery hue and live much in the sand underneath the water. They are prized as human food and as bait.

Laurentian Shield refers to the Precambrian rocks in the region of the Upper Lakes of Canada nearly 2 million sq. m. in extent. Of enormous importance to Canada on account of the mineral wealth, forests yielding valuable timber and wood pulp and water power.

Lava the molten rock which is erupted from a volcanic vent or fissure. Also the same material which has cooled and solidified.

Lawn very fine spun bleached linen in olden times called cloth of Rheims.

Lead a soft malleable metal symbol Pb (Latin *plumbum*) occurs in numerous ores which are easily smelted. Its most important source is the mineral galena which consists chiefly of lead sulphide rarely is it found free. Lead is largely used in plumbing on account of its pliability and in nuclear reactors as a shield against radiation because of its very high density. As an alloy element it combines in the formation of type metal, stereo metal, shot metal, pewter and many other compounds. Oxides of lead are used in some types of glass and in the manufacture of paints (red lead). All lead compounds are poisonous. Leading producers of lead are the United States (Missouri), Australia (Broken Hill) and the Soviet Union.

Leaf Insect a group of insects related to the locusts, grasshoppers and stick insects which in colour and form closely resemble leaves.

Leaf Miners insect larvae which tunnel between the upper and lower skins of leaves. Most leaf miners are caterpillars of tiny moths. Some sawfly larvae have the same habit.

Leagues or combinations of kings' countries communities have been frequent since the kings of Canaan united against the Israelites. Among the most famous leagues may be mentioned the Holy or Catholic League which prevented the accession of Henry IV of France until he became a Roman Catholic and the League of Augsburg against Louis XIV of France in 1688.

League of Nations was founded on Jan. 10 1920 with the object of promoting international peace and security. The original members were the signatories to the Peace Treaties at Versailles and membership grew to fifty three as new nations and ex enemy States were admitted. Two notable absentees were the United States and Soviet Russia the latter not being represented until 1933. Germany was a member from 1920 to 1933. The League had an Assembly which met at Geneva every year and a Council which met five or six times a year. The Permanent Court of International Justice sits at The Hague. The final Assembly of the League was held at Geneva between April 8 and 18 1946. Its place has been taken by the United Nations. The International Labour Organisation, set up by the League of Nations met on April 20 1944 at Philadelphia and resumed its old quarters at Geneva under the new organisation in 1946.

Leap Year or Bissextile was fixed by Julius Caesar 45 B.C. the addition of one day in every four years bringing the measure of the calendar year even with the astronomical year with three minutes per year over. The Gregorian Calendar corrected this by dropping leap year at the centuries not divisible by 400. For instance 1700 1800 and 1900 were not leap years.

Learning—See F38(1) Q14-30

Leather was made in ancient Egypt Greece and Rome and has through succeeding centuries played an important part in the service of man. It consists of the dressed hides or skins of animals after the process of tanning has been gone through. Untanned skins are known as pelts. Leather is classed either according to the skins

from which it is made or the system of preparation employed. The best known kinds are morocco, kun, Russian, chamous, Cordovan, grained, patent, russet, tan, calf, Hungarian.

Leech an aquatic blood sucking worm mostly found in fresh water ponds. Each end of the body is provided with a sucker but that at the head end has jaws and teeth. The medicinal leech has three jaws. The leech attaches itself with avidity to animal bodies and sucks until glutted. Its saliva contains an anti-coagulant.

Leeward a nautical term meaning the sheltered side of a vessel—that is the opposite side to that from which the wind is blowing.

Legion a body of Roman troops varying in numbers at different periods. A legion was divided into 10 cohorts and every cohort into three maniples. Three legions composed the Roman army of occupation in Britain.

Legion of Honour the French order for distinguished services military or civil was instituted by Napoleon I in 1802 and confirmed and modified under later rulers. There are five grades—Grands Croix, Grands Officiers, Commandeurs, Officiers and Chevaliers.

Legume the fruit typical of the pea bean family or Leguminosae.

Lemming small light brown rodents with dark spots abounding in Scandinavian countries and in Siberia about 5 in. long with a short stump of a tail. The migrations of the lemmings are famous probably caused by overbreeding when food is plentiful. So insistent is the urge to keep moving that these animals will march on into the sea in their thousands and be drowned.

Lemur the most primitive member of the Primate order of mammals (to which man apes and monkeys also belong). They are noted for having strong plantar toes enabling them to use their feet as hands and also well developed thumbs on the hands. They have long squirrel like tails for shaped heads and large staring eyes and are distributed over the tropical parts of the Old World being most abundant in Madagascar.

Lend Lease During the earlier phases of the Second World War the bulk of British investments in the U.S.A. had to be either sold or pledged to Americans in payment for dollar supplies. After the United States entered the war this drain was stopped by the Lend Lease arrangement under which Great Britain met the costs of American consumption in Great Britain while the United States paid for British supplies from America. This arrangement was abruptly terminated on the ending of hostilities and Great Britain and other belligerent countries found themselves without means of paying in dollars for indispensable American supplies including the foodstuffs materials and capital goods needed for economic reconstruction. In these circumstances Great Britain negotiated with the United States and also with Canada a large loan which was used for buying dollar supplies and played an important part in helping the West European economies to maintain themselves and feed their peoples while they were carrying through the earlier stages of post war reconstruction. These loans involved large charges for interest and amortisation in future years but proved far too small to meet the dollar deficit for more than a short period. In face of this situation the United States launched the Marshall Plan (q.v.).

Lenses pieces of transparent material designed to focus an image of an illuminated object. Usually of glass but plastic lenses are common and quartz etc. are used for special purposes. The surfaces of the simplest lenses are parts of spheres. Lenses which are thickest or thinnest, at the centre are called convex and concave respectively. Lenses of complex shape are often used in microscopes etc. Electron lenses are arrangements of electric or magnetic fields which focus beams of electrons e.g. on television screens.

Lent the forty days' period of fasting that precedes Easter.

Lepidoptera, the order of insects with scaly wings and bodies to which the 90 000 butterflies and moths belong.

Leptons A group of particles which include electrons neutrinos and muons. All are much

lighter than protons or any of the baryons *See* **F14**

Lepus the constellation of the Hare situated under the Orion group and one of the constellations with which the ancients were familiar

Lettres de Cachet sealed letters which the kings of France issued to their agents to secure the imprisonment of distrusted or disliked persons without trial. Abolished in 1789

Levée a State reception held by the Sovereign or his representative and attended by men only

Lewis a contrivance for stone lifting the principle of which was known to the ancient Romans. It consists of two dovetail tenons of iron or other metal expanded by an intervening key in a dovetail shaped mortice in the stone and shackled by a ringed bolt to the hoisting chain

Leyden Jar the earliest form of electrical condenser. Its invention is usually credited to Muschenbroeck of Leyden (1745). It consisted of a jar coated inside and out with tin foil for about two thirds of its height and having its inner coating connected with the top by a brass knob and chain. The jar was charged by connecting it to an electrostatic machine

Lias a geological term referring to the lower section of the Jurassic group and mainly comprising shales and limestones

Liberalism *See* **J28**

Libraries before the invention of printing were few and collected together at enormous cost. At Nineveh remains of libraries consisting of tablets of baked clay have been discovered. There were two libraries at Alexandria containing a vast collection of rolls or volumes founded by Ptolemy I Soter (367-282 B.C.) and established by Ptolemy II Philadelphus (309-246 B.C.). Among the great libraries of later times may be mentioned the Vatican Library at Rome moved to its present premises in 1588, the Royal Library in Paris which later became the Bibliothèque Nationale, The Astor Library New York and in England the Bodleian Library Oxford and the British Museum Library at Bloomsbury. Since 1850 public libraries have been established in all the chief cities and towns of the kingdom. The first lending library was opened in Edinburgh in 1726. In most villages there is a county library centre to which collections of books are sent by the County Library. In Great Britain there are 24 000 centres of this kind in village clubs halls shops schools and even homes. In some counties there is a library van or the bibliobus as it has been called by a French writer. This travelling library tours on a pre-arranged time table so that everyone knows exactly when it will arrive. The British Museum Library in London the National Library of Scotland in Edinburgh that of Wales in Aberystwyth the Bodleian Library of Oxford and the Cambridge University Library comprise the copyright libraries entitled to receive a copy of each new book published in Britain. Other national libraries are the National Reference Library of Science and Invention (part of the Dept of Printed Books of the British Museum) the National Lending Library for Science and Technology under the Department of Education and Science at Boston Spa Yorkshire and the National Central Library which is responsible for inter-lending at national and international level. On the future organisation of the national libraries the Dainton committee reporting in 1969 foresaw that in two or three decades the larger libraries laboratories and industrial firms will be directly linked through their individual computer terminals to the computerised catalogue of the national libraries. For loans direct dialogue between interrogator and computer information source may well have become commonplace and computer storage capacity will begin to be able to cope with the retention of full texts of the world's literature to process it in response to particular queries and if necessary to display it remotely by facsimile transmission wherever it is needed. The Dainton committee's proposals were followed by a government White Paper *The British Library* which contained

proposals for the creation of a single national libraries organisation to be known as the British Library. It would consist of the British Museum Library and National Reference Library of Science and Invention (research and reference facilities to be accommodated in new buildings near the British Museum) the National Central Library and the National Lending Library for Science and Technology (lending facilities at Boston Spa).

Lichens In every lichen two plants are associated one being an alga and the other a fungus. The fungus derives its food from the alga probably the alga gains too from the association being protected against desiccation by the fungus (an example of symbiosis). Lichens are the first plants to colonise bare rocks.

Life Boat was invented by three men. Lionel Lukin who converted a cable into a boat for saving life in 1785. William Wouldhave who discovered how to make a boat right herself if she capsized and Henry Greathhead who built a life boat partly from Wouldhave's model in 1784. This boat was stationed at South Shields which was the first permanent life boat station to be established. It was not until 1851 that the first self-righting life boat was built and a motor was first installed in a life boat in 1904. Modern motor life boats have engines of from twin 18 h.p. to twin 80 h.p. with a speed of nearly 10 knots. All coastal life boats in this country are maintained by the Royal National Lifeboat Institution founded by Sir William Hillary in 1824.

Light a particular kind of electromagnetic disturbance capable of travelling through space and some kinds of matter and of affecting our eyes to cause vision. Its finite speed was first demonstrated by O. Römer using observations of the eclipses of Jupiter's satellites in 1675. In 1860 Maxwell showed that light waves are electromagnetic. Since Einstein's theory of relativity (1905) it has been generally realised that the speed of light is a fundamental natural constant. Visible light with wavelengths between about 4×10^{-7} cm is only a small part of the electromagnetic spectrum. Subtle modern methods give the speed as 2.997930×10^{10} cm per sec (about 186 000 miles per sec).

Light Year A measure of astronomical distance equal to the distance light travels in the course of a year. A light year is thus 5.88 million million miles. *See also* **F3(2)**.

Lighthouses to warn ships of dangerous places and indicate coasts points, harbours etc have existed since the building of the Pharos, a tower of white marble 600 ft high built by Ptolemy II Philadelphus at Alexandria about 280 B.C. In early lighthouses the lights were simple fires. The most famous and one of the earliest British lighthouses is the Poldstone (q.v.) Dungeness lighthouse opened in 1960 is very modern in design, capable of automatic operation and the first of its kind to incorporate the xenon electric arc lamp as a source of illumination. The electric fog signal consists of sixty loud speaker units built into the tower just below the lantern giving a honeycomb effect. The lighthouses of England and Wales the Channel Islands, and Gibraltar are under the control of Trinity House. Commissioners of Northern Lighthouses control those of Scotland and the Commissioners of Irish Lights control the coasts of Ireland. Particulars of lights in all parts of the world are published for the guidance of navigation in the *Admiralty Lists of Lights* compiled annually by the British Admiralty.

Lightning the flash of a discharge of electricity between two clouds or between a cloud and the earth, when the strength of the electric fields becomes so great as to break down the resistance of the intervening air. With forked lightning the actual path often branched, is visible while with sheet lightning the flash is hidden by the clouds which themselves are illuminated. Ball lightning or fireballs is the name given to the luminous balls which have been seen floating in the air during a thunderstorm. The Boys camera has provided much information regarding the sequence of events in a lightning discharge. It is found that a flash

consists of a number of separate strokes usually four or five and that the discharge of electricity to earth begins with a faintly luminous leader moving downwards and branching at intervals. As the ground is approached a much brighter luminosity travels back along the conducting channels lighting up the several branches. The multiple strokes which follow in fractions of a second have the same return nature and are rarely branched. Lightning flashes to earth damage structures cause a loss of life and endanger overhead power systems often interrupting electricity supply. Such storms generally affect radio transmissions and present hazards to aircraft. Thunder clouds may develop energy far exceeding the capacity of our largest power generating stations.

Lightning Conductor a metal rod the upper part of which is of copper with a conical point the lower portion being iron which extends into the earth. Its effect is to gather to itself the surrounding electricity and discharge it into the earth thus preventing its falling upon the protected building. In ships lightning conductor are fixed to the masts and carried down through the ship's keel sheathing. Benjamin Franklin was the first to realise the possibilities of lightning protection and in 1752 carried out his famous experiment of drawing electricity from thunder clouds with the aid of a sharp pointed conductor fixed to a kite.

Lillibulero an old marching song composed by Purcell. With words by Wharton it is said to have sung James II out of three kingdoms. Used by the B.B.C. during the second world war as a station identification signal preceding news bulletins and still in use to announce the Overseas Service programmes in English.

Lily Family (Liliaceae) one of the largest families of flowering plants with 200 genera and 2 500 species. It includes the true lily, (*Lilium*) tulips and hyacinths. Vegetables belonging to the family are the onion and asparagus.

Limes trees of the genus *Tilia* including some 30 species spread over north temperate regions. The word is a corruption of linden. Limes native to Britain are the small leaved *T. cordata* and the broad leaved *T. platyphyllos*. The hybrid *T. vulgaris* was introduced into Britain from the Continent during the 17th cent. and is frequently seen in streets and parks. Lime wood was used by Grinling Gibbons for his fruit flower and bird decorations.

Limestone is carbonate of calcium. It is found in every geological formation and is often highly fossiliferous. Marble is limestone that will polish after cutting.

Linen, a textile fabric manufactured from flax fibre known to the ancient Egyptians and first manufactured in England under Henry III. by Flemish weavers. The chief seat of the manufacture is Ulster with Belfast as the centre. Dunfermline (famous for its damasks) and Manchester are also large linen producing towns.

Ling a sea fish common on the coasts of Britain and abounding in more northern waters. It averages from 3 to 4 ft. in length and is a voracious feeder living chiefly on small fish. Ling is also the name applied to *Gallina vulgaris* the plant which most people called 'heather'.

Linguistics See M38(1).

Linsed the seed of the flax plant containing apart from its fibrous substance certain oily and nitrogenous matter of considerable commercial value. Thus yields linsed oil and some of the residue is used to make cattle food. Lion, the most impressive of the Cat family (*Felis leo* or genus *Panthera*). It is chiefly found in open bush country in Africa being comparatively rare in Asia. Its large square head, its flowing mane (in the males only) and its tufted tail distinguish it. From tip to tip it can reach a length of 10 ft. a weight of 500 lb. Only weak old lions are liable to attack man usually they avoid him.

Lion and Unicorn, the supporting figures of the royal arms of Great Britain, date from the union of Scotland with England at the accession of James I. (James VI. of Scotland) the lion representing England and the unicorn Scotland.

Liquours are essences combined with alcoholic liquid, and are of many kinds, named according to their flavourings or place of production, and

include Maraschino, Chartreuse, Curaçao, Benedictine, Noyau, Kummel, etc.

Liquid the name given to matter in such state that it takes its shape from the containing vessel. The volume it occupies is independent of the container however. See F17 18.

Litanies were first used in church processions in the 6th cent. The first English litany was commanded to be recited in the Reformed churches by Henry VIII in 1544.

Lithium a soft metallic element symbol Li similar to sodium. It is very reactive and is stored under paraffin oil. It is the lightest metal element.

Lithography the art of drawing on stone and printing therefrom was discovered by Alois Senefelder about 1796 and was introduced into England a few years later. Many improvements in the art have been made in recent years especially in chromolithography and photolithography.

litre a metric measure was abolished in 1964 as a scientific unit of volume but remains as an everyday unit e.g. of wine in countries that use the metric system for everyday purposes.

Liturgy the name given to the Church ritual though strictly applying only to the portion used in the celebration of the Eucharist or Lord's Supper. The Anglican Liturgy is laid down in the Book of Common Prayer (1549). Parliament gave its consent in 1965 for changes in the form of worship.

Liverworts (Hepatics) a class of simple green plants related to the mosses. There is no differentiation into stem and leaves. Liverworts are most common in damp situations such as the banks of ditches.

Lizard the name given to a diversified order of reptiles of which there are about 1 800 species. Included among the lizards are the geckos, chameleons, glass snakes, skinks and blind worms.

Llama mammals related to the camels from which they differ in small size, absence of humps and more woolly coat. The domestic llama of S. America is used as a beast of burden also providing wool, meat and milk. See also Alpaca, Guanaco.

Lodestone or Loadstone an oxide of iron found chiefly in Sweden and Norway. Its scientific name is magnetite. It has the power of attracting pieces of iron and served as the first magnets used in compasses. One of the class of non-metallic magnetic materials nowadays known as ferrites.

Lobby Correspondents are political correspondents of newspapers who do not report the actual proceedings of Parliament—this is done by Parliamentary Correspondents—but interpret political news and events.

Lobsters are marine crustacean animals existing in large numbers in the northern seas of Europe and America and in fair proportion on some parts of the British coast, especially in the neighbourhood of the Channel Islands.

Locarno Treaty of 1925 whereby Germany, France and Belgium undertook to maintain their present frontiers and to abstain from the use of force against each other. Hitler broke the pact by re-occupying the Rhineland and the demilitarisation of which had been recognised by Germany.

Locust insects of the grasshopper family but much more powerful. They are inhabitants of hot countries and often make their appearance in untold millions like clouds devastating all the vegetation that comes within their course. The locust-tree (*Ceratonia siligua*) is supposed to have furnished food to St John the Baptist in the wilderness and its beans have accordingly been styled St John's Bread.

Loess a deposit of silt or marl laid down by wind action. The biggest loess deposits are in Asia the source of the dust of which they are composed probably being the deserts of Central Asia.

Log a line used for reckoning the speed of which a ship is travelling. It was first used in the 16th cent. The line is divided into spaces of 50 ft. marked off by knots and measured by a half minute sand glass, bearing the same proportion to an hour as 50 ft. bears to a mile.

Logarithms a system of calculation invented by John Napier in 1614 and developed by Henry Briggs a few years later. Thus if a

number is expressed as the power of another number a if $a = b^n$ then n is said to be the logarithm of a to base b written $\log_b a$. Common \log s are to base 10 and Napierian to base e 7193818 expressed as e Their use represents a great saving of time

Logical Positivism See 328

Lollards See 328

Lombards a German people originating on the Elbe who settled in Italy in the 6th cent occupying northern and central regions and establishing a kingdom with Pavia as capital They were conquered by Charlemagne in 774 but left their name to the region of Lombardy Lombard Street London takes its name from the Lombard merchants and bankers who came to settle there in the 12th cent

London Clay geological stratum which occupies much of the London Basin and part of the Hampshire Basin It represents the lower stratum of the Eocene Outside the metropolis brickfields utilise the clay for brickmaking. Water held above this impervious stratum is tapped by a number of artesian wells in London The tunnels of the Capital's underground railway run through the London Clay

London University comprises nearly one third of the academic activity of the United Kingdom and is recognised as one of the great universities of the world Originated in the foundation of a non-sectarian college in Gower Street in 1828 Among the chief colleges are University College Imperial College of Science and Technology London School of Economics School of Oriental and African Studies Queen Mary Birkbeck Royal Holloway Bedford Westfield and Queen Elizabeth College London University was the first to throw open all degrees to women (1878)

Long Distance Routes The National Parks and Access to the Countryside Act 1949 provided for the establishment in England and Wales of Long Distance Footpaths and Bridleways The following have been approved but only the Pennine Way has been completed Pennine Way (a magnificent hill walk of 250 miles from Edale in Derbyshire along the Pennines over the Cheviots to the Scottish border) Pennine Brokechire Coast Path Offa's Dyle Path (168 miles along the marches of Wales) South Downs Way (Beachy Head to Salisbury) South West Peninsula Coast Path (North Cornwall, South Cornwall South Devon Somerset and North Devon Dorset) Yorkshire Coast and North York Moors See also National Parks

Longitude of a point on the earth's surface is the angle which the meridian through the poles and that point makes with some standard meridian The meridian through Greenwich is usually accepted as the standard meridian and the longitude is measured east or west of that line As the earth revolves through 360 in 24 hrs 15 longitude represent 1 hour's difference in apparent time

Long Parliament (1640-60) marked the end of Charles I's 11 year attempt to govern without parliament It earned through what has come to be called the English Revolution and was the parliament of the civil war (1642-49)

Lord Chamberlain See Chamberlain, Lord
Lord Lieutenant is the Queen's representative in the county and his office is now largely ceremonial. On his recommendation the magistrates or Justices of the Peace are appointed by the Lord Chancellor The office was created in 1549 to take over the military duties of the sheriff

Lords, House of, the Upper House of the British Parliament composed of Lords Spiritual and Lords Temporal The former consist of the two Archbishops and twenty-four English Bishops and the latter of Peers and Peersesses. The full membership (1970) is 1069 The right of the Lords to veto Bills passed by the Commons is restricted by the Parliament Acts of 1911 and 1949 The Lord High Chancellor presides over the House of Lords See Section C, Part II

Louse parasitic insect found on the skin of birds and mammals The bird or biting lice belong to the order Mallophaga the true or sucking lice to the order Anoplura Two species of lice parasitise man, and one of these the body louse is a carrier of typhus

Louvre one of the old royal palaces of Paris was built in its present form partly by Francis I and added to by later monarchs Louis XIV completing the edifice Napoleon I turned it into a museum and enriched it with the plunder of many foreign art galleries The great extension to the Louvre building begun by Napoleon I was completed under Napoleon III in 1877 Much injury was done to the building during the Commune of 1871 Amongst other famous treasures it houses the Venus de Milo and Leonardo da Vinci's masterpiece *La Gioconda*

Lovelard a vivid little bird native to Africa resembling a parakeet but with a short wide tail and short body

LSD (di-lysergic acid diethylamide) This hallucinogenic drug has achieved wide notoriety because of its use by certain people to give them selves abnormal mental experiences Doctors have frequently warned against the dangers of its use It is active in extremely small quantities and a dose as small as a fifty millionth part of a gram can cause marked disturbances of the mental function in man LSD has been used in the study of mental diseases because it produces symptoms very similar to mental disorders such as schizophrenia

Luddite a combination of workmen formed in 1811 in a period of great distress with the object of destroying the new textile machinery then being largely adopted which they regarded as the cause of their troubles Their first outbreak was at Nottingham and was stated to have been started by a young apprentice named Neil Ludd Afterwards serious Luddite riots occurred in various parts of the country especially in the West Riding of Yorkshire where many people were killed mills were destroyed, and numbers of rioters were tried and executed Charlotte Brontë used the period in her novel *Shirley*

Lunar Month See Month

Lung Fishes or Dipnoi See Dipnoi

Lutecium, clement of the rare earth metal group discovered in 1907 by Urban

Lutheranism See 328

Lynx, cats of sturdy build with tufted ears and spotted fur inhabiting many parts of the world, including Northern and Central Europe They commit serious ravages among sheep and goats and are very fierce

Lyon King of Arms, the President of the Scottish Lyon Court and head of the heraldic organisation for Scotland

Lyre Bird, a remarkable family of Australian birds the males of which possess a beautiful lyre shaped tail The bird is not more than 15 in long but its tail displayed during its remarkable courtship dance is 23 in in length There are two species the Superb and Albert's Lyrebird

M

Macaque A family of monkeys which include the Barbary ape (specimens of which live on Gibraltar) the Rhesus macaque (the organ grinder's monkey and the one used for experimental work in the investigation of disease) the Bonnet monkey of southern India and Ceylon the Crab-eating and the Pig-tailed monkeys of south-eastern Asia

Macaw a genus of large parrots with brilliant scarlet and sky blue plumage with interminglings of green Native to South and Central America

Mace, originally a weapon of offence now an ensign of authority borne before officers of state and other dignitaries In the House of Commons the mace is handed to an official of the Crown by the Sergeant at Arms at the close of a parliamentary session

Mach Number Unit of flight speed The ratio of speed of flight to speed of sound under same conditions of pressure and density Speed of sound at sea level is 762 m.p.h., so flight speed of 881 m.p.h. is equivalent to a Mach Number of 1 At supersonic speeds the Mach Number is greater than 1 subsonic speeds less than 1

Mackerel, a familiar sea-fish existing in large numbers in the northern waters of both hemispheres In May and June immense shoals are to be found round the British coasts

Macromolecules are very large molecules about 10 000 times or more as heavy as ordinary small molecules like hydro- en . Most are built up from a large number of simple sub units e are polymers ($q v$). The term macromolecule is often used in biology *eg* starch and cellulose are biological macromolecules both built from glucose sub units. Other important ones are proteins and nucleic acids. The properties of macromolecules depend on the sub units of which they are composed.

Madder one of the most important of dye stuffs largely used in producing Turkey red dye but now superseded by synthetic alizarin. Natural madder is the root of the *Rubia tinctorum*.

Madrier a term in military engineering for a beam used to support the earth in a mine or fortification or to receive the mouth of a petard.

Maelstrom a great whirlpool. The most famous is that off the coast of Norway between the islands of Moskenes and Mosken of the Lofoten group the power of which has been much exaggerated.

Mafia a secret Sicilian society formed for purposes of exploitation intimidation and violence prominent about 1860 and since the second world war. It was not until 1962 that the Italian Parliament decided to set up a commission to study it and the means of eradicating it. One of the unsolved Mafia murders (that of the Socialist municipal councillor Carmelo Battaglia in 1966) was reopened in 1969 by the parliamentary commission of inquiry. The American branch of the Mafia the Cosa Nostra has infiltrated many city governments by bribing officials.

Magellan Clonds of the name given to a pair of small galaxy satellite systems of our own galaxy visible only from the southern hemisphere. On account of their relative nearness to the earth (150 000 light years) they are receiving much attention from astronomers.

Magenta a blue red aniline dye discovered in 1859 by Sir W H Perkin and named after the great battle of that year between the French and Austrians.

Magis See J29.

Magistrates or Justices of the Peace preside over courts of petty sessions and are appointed by the Lord Chancellor on the recommendation of the Lord Lieutenant of the County. Most J P s are laymen and are unpaid. In certain big towns a legally qualified paid full time magistrate is appointed known as a stipendiary magistrate. In London stipendiaries are known as Metropolitan Stipendiary Magistrates. J P s are no longer appointed over the age of 60 and they must retire when they reach 70. There are now arrangements for the training of magistrates. By the Justices of the Peace Act 1968 *ex officio* J P s are abolished except for the Lord Mayor and aldermen of the City of London. See D43 5, 6.

Magma molten rock material rich in volatile constituents prior to its eruption at the surface.

On eruption and loss of volatiles it becomes lava.

Magna Carta was sealed by King John at Runnymede on June 15 1215 in obedience to the insistent demands of the barons and has been confirmed many times by later monarchs. It was not a revolutionary document. It laid down what the barons took to be the recognised and fundamental principles for the government of the realm and bound king and barons alike to maintain them. Its main provisions were that no man should be punished without fair trial that ancient liberties generally should be preserved and that no demands should be made by an overlord to his vassal (other than those recognised) without the sanction of the great council of the realm.

Magnesium, a metallic element symbol Mg first isolated in 1808 by Sir Humphry Davy who prepared it by electrolyzing the chloride. Its chief ores are magnesite and dolomite. Industrially it is obtained by electrolysis. Many important light alloys contain magnesium. The metal burns with a very bright light and for this reason it is used in photographers flash bulbs and also in firework manufacture.

Magnetic Pole Either one of two regions of a magnet where the attraction appears concentrated.

Magnetic Storms large irregular disturbances

superimposed upon the normal magnetic field of the earth. They may occur at any time but are most frequent during equinoctial months and in years of sunspot maxima. World wide in extent magnetic storms are most pronounced in the polar regions being due apparently to intense electric currents located in the upper atmosphere near to the zones of greatest auroral frequency. One theory attributes the high ionisation of these belts to solar radiation. Magnetic storms cause radio fade outs and interfere with telegraphic communication.

Magnetism originally the name given to the quality of attraction for iron possessed by lodestone ($q v$). Now known to be a phenomenon inseparably connected with electricity (F18). Strong magnetic attraction is possessed by a comparatively small class of substances iron nickel and cobalt are the most common elements but there are several less well known *eg* gadolinium. Many alloys have valuable magnetic properties which make possible numberless technical devices. New magnetic substances are always being developed (*see Ferrets*). The earth acts like a huge magnet with its axis inclined at about 11° to the axis of rotation the magnetic poles being on the Boothia Peninsula (North Canada) and South Victoria Land (Antarctica). The magnetic field at the surface consists of the regular field of a magnetised sphere with an irregular field superimposed upon it. Variation in the magnetic forces occurs from place to place and from time to time and maps showing the distribution over the globe of points of the same declination (*i.e.* the angle which the magnetic meridian makes with the geographical one) are of the most importance in navigation. In the south east of the British Isles at present a magnetic needle points 9° and in the north west 14° west of true north. Little is known regarding the origin of the main (regular) field of the earth but it is believed that the irregularities are due to the presence of intense electric currents in the upper atmospheres and local magnetisation of rock strata. In 1967 the discovery was claimed of isolated magnetic poles e north and south magnetic poles existing separately just as positive and negative electrical charges exist separately. If this is confirmed it will probably rank as one of the most important experimental results of the 20th cent because of its significance for the theory of electromagnetism and fundamental particles.

Magnetohydro dynamics. A current carrying wire always experiences a force if it is in a magnetic field. This is the well known electrolytic force and electric motors work because of it. If the current is carried in a fluid *eg* a liquid metal or a plasma these forces cause bodily movements of the fluid which are in general very difficult to calculate. The forces are then called *magnetohydro dynamic forces*. Now magnetic fields are themselves produced by electric currents so a current flowing in a fluid produces a magnetic field which then reacts on the fluid itself by means of the magnetohydrodynamic forces. In the Harwell machine Zeta used in studying the technical problems of thermonuclear reactions this effect acts so as to constrict the electric discharge on to the axis of the tube and thus keeps it away from the walls. This action is assisted by an extra magnetic field produced by a separate current flowing in metallic conductors outside the tube. Thus the hot plasma is contained by magnetohydrodynamic forces and not at all by the material tube wall. In practical devices of the future magnetic forces may have to sustain plasma pressures of 60 atmospheres—a pressure for which a thick steel wall would normally be used! *See also Plasma Physics*.

Magnificat, the hymn of the Virgin Mary given in Luke 1 46 beginning in the Vulgate with the words *Magnificat anima mea Dominum* (My soul doth magnify the Lord) and used in the services of all Christian Churches.

Magnitude in astronomy is a measure of the apparent brightness of a star which is inversely proportional to the square of its distance. A low number indicates a bright star and a high one a faint star. The *absolute magnitude* is a

- measure of *real* brightness i.e. the brightness a star would have at a standard distance away of 32.6 light years. The distance can be calculated if the apparent and absolute magnitudes are known.
- Magnolia** species of the family *Magnoliaceae* comprising many beautiful trees and shrubs with large and fragrant flowers and chiefly native to North America and Asia. Introduced in 1688.
- Maggie** a well known bird of the crow family of glossy black and white plumage famous for its mischievous propensities.
- Magyars** the Hungarian race who came to eastern Europe from S.W. Asia and settled in Hungary in the 10th cent. Their language belongs to the Finno-Ugrian group.
- Mahdi**, an Arab leader of great influence invested with powers akin to those of a Messiah in the Mohammedan mind. The title was taken by Mohammed Ahmed who overran the Egyptian Sudan and in 1885 captured Khartoum.
- Mahogany** a fine hard wood susceptible of a very high polish and distinguished for the beauty of its colour and markings. Obtained chiefly from the trees of the genera *Swietenia* (Spanish or Cuban mahogany) and *Khaya* (African mahogany) of the family Meliaceae. According to tradition Falegh had a mahogany table made for Queen Elizabeth.
- Maidenhair Tree** or Ginkgo. This tree takes its name from the shape of its leaves which resemble those of the maidenhair fern. Widely cultivated in China and Japan. It is the only survivor of an order of gymnosperms which flourished in Mesozoic times. Botanically interesting because the male gametes are motile.
- Maison** chateau at Rueil Milmaison a western suburb of Paris. It derives its name from having been inhabited in the 11th cent. by the Norman brigand Odon and afterwards according to the tradition by evil spirits exorcised by the monks of St. Denis. It was the residence of Napoleon and of the Empress Josephine after her divorce. She died there in 1814 as the result of a chill caught while showing the Russian Emperor round the grounds. In 1900 it was given to the nation.
- Malmsey** a strong sweet wine originally made in Greece but now also in Spain, Madeira and the Azores known also as Malvoisie.
- Maltose** a sugar formed in cereal grains during germination. It is produced by hydrolysis of starch and further hydrolysis converts the maltose into glucose.
- Mamluks** commonly known as Mameluks were originally—in the 13th cent.—a bodyguard of Turkish and Circassian slaves in the service of the Sultan of Egypt and attained such influence that in 1250 they were strong enough to appoint one of their own body to the throne of Egypt. After that a succession of Mamluk Sultans reigned down to 1617. Then the Turks annexed Egypt and the Mamluks were taken into the service of the Beys. They again came to the front after Napoleon's conquest of Egypt and for a time resumed governmental sway but in 1811 they were decored into the citadel of Cairo and massacred by order of Mehemet Ali.
- Mammoth** extinct elephants of gigantic size. In 1799 the first perfectly preserved specimen was found in Siberia in a block of ice. It was in prehistoric times an inhabitant of Britain and other parts of Europe as well as of Asia and America.
- Mammoth Cave of Kentucky** about 10 miles long is one of a series of spacious caverns formed in the limestone rock formation, and is from 40 to 300 ft. wide and at one point 300 ft. high. Stalactites and stalagmites abound.
- Manatee** an aquatic mammal of the sea cow (Sirenia) order of mammals averaging when full grown from 10 to 12 ft. in length, with shovel-shaped tail and four limbs and pails which almost give the appearance of arms and hands. In spite of their ungainly aspect these creatures are believed to have given rise to the legend of mermaids.
- Manchus** the original nomadic race inhabiting northern Manchuria who invaded China early in the 17th cent. A Manchu dynasty occupied the imperial throne of China from 1644 to 1911.
- Mandarin** the name given to a powerful Chinese official civil or military under the old regime whose rank was shown by the wearing of a button on the cap. Mandarin is the major language of N. China (see M44).
- Mandible** the lower jaw in human anatomy. The two parts of a bird's beak are known as the upper and lower mandible. The term is also used for biting jaws in arthropods.
- Manganese** a metallic element symbol Mn discovered by Scheele in 1774. It is silver white not very hard (it forms a hard alloy with carbon) brittle and tarnishes when exposed to air. Its chief ore is pyrolusite (manganese dioxide). Steels containing manganese are very tough and used for making machine tools.
- Maniple** eucharistic vestment worn over left arm.
- Manna**, a tree of the ash genus *Fraxinus ornus* growing in the South of Europe and in the East and exuding a sweet substance which is gathered, boiled and eaten.
- Manometer** instrument used to measure gas pressure. Usually a U tube containing water or mercury one end open to the atmosphere the other to the gas whose pressure is to be measured. More sensitive for small pressures than the Bourdon gauge.
- Mansers** were estates originally granted in Anglo-Saxon times as rewards for knightly service and included the privilege of a special court with jurisdiction criminal and civil within the manorial territory. See Court-Leet.
- Mansion House** the official residence of the Lord Mayor of London stands opposite to the Bank of England and was erected in 1739-50 from the designs of George Dance.
- Mantis** large insects belonging to the same order as the locusts and grasshoppers. The manner in which the forelegs are held as though in supplication has gained for these insects the common name of praying mantis. They are distributed throughout the warmer countries of the world.
- Manx** the Celtic dialect (Manx Gaelic) of the Isle of Man now on the point of extinction.
- Maocism** See J30.
- Maoris** the race found in New Zealand at the time of its discovery by Europeans. The Maoris are believed to have migrated from Polynesia about 1350. They number 220,718 (1969) and being very intelligent people have adapted themselves with considerable success to the conditions of civilized life. Until 1870 they were frequently in arms against the Government but since then have settled down with the Whites as equal citizens.
- Maple** trees native to the northern hemisphere. There are over 100 species. The sycamore is the best known species growing in Britain. The sugar maple abounds in Canada and the eastern parts of the United States. The sugar is tapped by boring holes in the tree in Feb. and Mar. and the juice that escapes is collected and evaporated. The maple-leaf is the Canadian national emblem.
- Maquis** name of the dense scrub in Mediterranean France and Corsica providing good cover for bandits and outlaws. The French resistance movement adopted the name Maquis during the German Occupation 1940-45.
- Marble** is limestone in its hardest and most crystalline form. There are many varieties—39 were used in the building of the Paris Opera House—but white is the purest and rarest. White marble was used by the ancient Greeks for their temples and statues. Among the famous marbles of Italy are the Carrara and Siena marbles which were used by Renaissance sculptors. Devonshire and Derbyshire yield some beautiful marbles and Connemara furnishes a serpentine marble.
- March**, the third month of the year and the first of the old Roman Calendar. It was named after the god Mars and was the *Elyd* (storm) month of the Anglo-Saxons.
- Mardi Gras** the last day of the Carnival in France. Shrove Tuesday.
- Marionettes** are puppets moved by strings. They originated in the *Fantoccini* of the 15th cent. which had such a vogue in Italy and elsewhere on the Continent. The English *Punch* and

Judy is a version of Punchinello Puppet shows were known in the earliest civilisations

Marl, a rock composed partly of clay and partly of carbonate of lime

Marlinspike a pointed iron tool used by sailors to splice wire The instrument used when rope splicing is called a fid

Marmoset small monkeys confined to the New World. Very squirrel like in appearance with long bushy tails and thick woolly fur they are pretty little animals and the smallest of all monkeys There are claws not nails on their digits the big toe excepted

Marpelake Tracts seditious pamphlets written with great maliciousness by a group of ill-reputed puritans about 1686 and intended to discredit the episcopacy caused a great sensation in their time and led to the execution of their supposed author John Penry

Marquess or Marquis the title next in precedence to that of duke The first English marquess was Rovery de Vere Earl of Oxford who had the honour conferred upon him by Richard II in 1383

Margentry a kind of mlaying in which thin layers of coloured woods are wrought into a design, and mainly used in ornamental floors

Mars the fourth nearest planet to the sun (see F7) There used to be much speculation among scientists about certain dark lines which some observers had seen on the surface of the planet photographs gave no support to the theory of an artificially constructed network of canals but it seemed possible they represented areas covered by some simple form of vegetation of the lichenous type However photos taken by *Martiner 6* and *Martiner 7* which flew past the planet in 1960 showed no trace of the so called canals Like the moon it is pitted with craters and appeared to be a geologically dead planet Findings showed that its atmosphere is at least 98 per cent carbon dioxide with no trace of nitrogen without which life as we know it could not exist Atmospheric pressure is low about 5 millibars compared with the earth's 1 000 millibars A Viking spacecraft is scheduled to land on the planet in 1973 Mars has two small moons—Phobos and Deimos

Marseillaise, the French national hymn written and composed by Rouget de L'Isle a French engineer officer who was inspired to write it in 1792 to encourage the Strasburg conscripts It immediately became popular and received its name from the fact that it was sung by the Marseillaise troops while marching into Paris

Marsalsea Prison, a once well known house of detention in Salford It stood near St George's Church, and was originally a prison for royal servants convicted of offences but from 1842 to 1849 was a debtors prison It was abolished in 1849 Dickens described it in *Little Dorrit*

Marsh Gas, *Sec Methane*

Marsh Tortoise an amphibious animal of the order *Chelonia* spread over many countries and inhabiting ponds and small rivers There are 42 species and they are all carnivorous

Marton Moor near York was the scene of the famous battle between Prince Rupert and Cromwell on July 2, 1644 Cromwell's victory was the turning point in the Civil War

Marsupials members of the order of pouched animals Except for the opossums of America all marsupials occur in Australasia Well known marsupials are the kangaroos wallabies, and wombats

Martello Towers, circular forts erected on the coasts of England and Jersey early in the 19th cent as a defence against the threatened Napoleonic invasion So called from the circular fort at Martello (Corsica) which resisted an English fleet in 1794

Marten, carnivorous animals of the weasel family one species of which was once common in Britain, but now seldom met with Many valuable furs come from martens e.g. the sable of N Asia and the marten of N America

Martial Law a term loosely employed to indicate the suspension of the administration of normal civil law and its replacement by military authority when this is rendered desirable by such circumstances as war or rebellion

Martin, a well known bird visitor to Britain. It

belongs to the swallow family and the two species that spend their summers here are the house martin which makes its nest of mud under the eaves of houses and the sand martin which builds in sandy banks

Martingale a long strap or thong of leather one end of which is fastened to the arith of a horse between the fore legs and the other to the bit or to a thin mouthpiece of its own

Martinmas or St Martin's Day falls on Nov 11 and is one of the Scottish quarter days St Martin was a popular Saint with our ancestors and Martinmas was a busy time for the medieval housewife It was the date when

Martinmas Beef was dried in the chimney and enough bacon and mutton cured to last until the spring because owing to the scarcity of winter fodder fresh meat could seldom be obtained This diet of dried meat without vegetables caused scurvy King's evil leprosy and other maladies Originally the geese were longed to Martinmas not to Michaelmas the legend being that when Martin was elected Bishop of Tours he had himself but was betrayed by the cackling of geese He died in the 4th cent The spell of fine weather sometimes occurring at Martinmas is called St Martin's Summer

Martyrs People who suffer death in testimony to their faith Stephen was the first Christian martyr in 30 The first English martyr was St Alban 286 and in Tudor times many eminent churchmen went to the stake at West Smithfield in London and at Oxford where now exists the Martyrs' Memorial There is a Martyrs' Memorial Church in St John St Clerkenwell near the scene of the Smithfield fires

Marxism See 331

Mason and Dixon's Line is the boundary line separating the old slave states of America from the free state of Pennsylvania It was drawn by two English surveyors Charles Mason and Jeremiah Dixon between 1763 and 1767

Masques were light dramatic compositions set to music and performed on special occasions One of the best known examples is Milton's *Comus* which was given at Ludlow Castle in 1634

Mass the service in the Roman Catholic Church in which are enacted and enshrined Christ's words and actions at the Last Supper It is high or low i.e. performed with full choral service or merely by the rehearsal of prayers without singing Mass was first celebrated in Latin in the 4th cent and was introduced into England in the 7th cent The use of a vernacular language was sanctioned by the Second Vatican Council (1965)

Mass Spectrograph, an instrument for separating isotopes It works by sorting electrified particles according to their masses the particles stream through a magnetic and possibly an electric field and the lightest particles undergo the greatest deflection

Massorah, a collection of criticisms on the Hebrew text of the Scriptures and rules for its correct interpretation

Mast a long round piece of timber or tubular steel or iron, standing upright in a vessel and supporting the yards sails and rigging in general The earliest ships had only one mast carrying a simple sail The number increased until there were 4 or 5 or even more Above the lower mast of a sailing ship comes the topmast and above that the topgallantmast and royalmast The position of each mast is indicated by a prefix as foremast foretopmast foretopgallant mast foreroyalmast mainmast maintopmast etc The foremast is in the fore of the ship the mainmast in the centre and the mizen nearest the stern In large vessels nowadays the mast does not extend to the keel as it formerly did but is usually stopped at the second deck

Master of the Revels was an important Court official upon whom devolved the arrangement of Court festivities The office is at least as old as the time of Edward III By 1737 it seems to have died

Master of the Rolls one of the English judges, formerly a judge of Chancery but since 1831 a judge of the Court of Appeal only In addition he has charge of the rolls or records of Chancery and ranks next to the Lord Chancellor and Lord Chief Justice

Mastodon an extinct order of quadruped closely resembling the elephant in structure but larger

Materials Science is a blend of science and technology. It is the use of scientific research methods to study and improve materials for practical use. The deeper understanding so obtained enables scientists to design new substances with hitherto unknown combinations of properties that are useful in engineering aircraft, nuclear power, surgery, etc. Materials science institutes or university departments will usually contain an assortment of chemists, physicists, metallurgists, ceramists, engineers and others because materials science brings to bear on materials a great many specialised techniques. The scientific study of materials is bringing continual improvement in metals, ceramics, plastics, fibres and many valuable combinations of these.

Mathematics is a body of knowledge expressed in a language of symbols. Pure mathematics studies the propositions that can be deduced in this language by applying definite rules of reasoning to sets of axioms. In applied mathematics the mathematical language is used often with great effect to discuss problems of the real world such as mechanics, statistics and science generally. In range, subtlety, complexity and depth, mathematics is unsurpassed among the intellectual disciplines and its study has attracted some of the most brilliant men in history.

Matin, the first of the canonical hours or services of the day in the Roman Catholic Church and Morning Prayer in the Anglican Church. The daily service in the Roman breviary (*q.v.*) consists of eight offices or hours fixed by canon for prayer and devotion. Formerly Matins was recited or sung at midnight. Lauds at sunrise Prime at 6 a.m. Terce at 9 a.m. Sext at midday None at 3 p.m. Vespers at sunset and Compline before retiring for the night. Lauds are now commonly joined to Matins.

Mau Mau a secret anti-European terrorist movement which agitated the Kikuyu tribe of Kenya during the years 1953-57. Mau mau was a symptom of native insecurity and discontent; emergency powers were lifted in Nov. 1959 and large scale reforms were instituted. Kenya attained independence in Dec. 1963 with Mr. Jomo Kenyatta as Prime Minister.

Maundy Thursday the day before Good Friday commemorates the Last Supper. Maundy derives from Christ's command (*mandatum*) to his disciples on that day to love one another. It was the custom in the monasteries for the monks to wash the feet of the poor on this day and for many centuries the sovereigns of England through their almoners have distributed money, food and clothing to as many old men and as many old women as the Sovereign is years of age. The Royal Maundy ceremony is still observed; special silver money granted by the Royal Almoner is coined for the occasion and the distribution takes place in Westminster Abbey.

Mausoleum, a special place of sepulture generally for the reception of the remains of members of a royal or other family of distinction. The name is derived from the tomb of King Mausolus at Halicarnassus erected about 350 B.C. and forming one of the seven wonders of the world.

Mauve, a colouring matter produced from lichens by Dr. Stenhouse in 1848 but in 1856 obtained from aniline by William Perkin (1838-1907) who gave it the name Mauvein. This was the first synthetic organic dyestuff ever to be produced which led to the building up of the great synthetic dyestuffs industry (which Germany dominated before the First World War).

May the fifth month of the year but the third of the ancient Roman calendar. Supposed to be named after Maia, the mother of Mercury to whom sacrifices were offered on the first day of this month. In England in former days May Day was made the occasion of many festivities, including the crowning of the May Queen, dancing round the Maypole, etc.

Mayflower, the name of the ship which in 1620 conveyed the Pilgrim Fathers 101 in number from England to America. See Pilgrim Fathers.

May Fly See Ephemeroptera.

Mazarin Bible, an edition of the Latin Vulgate, acknowledged as the masterpiece of the Guten-

berg press (1456). It was the first book completely printed from movable types. It is called the Mazarin Bible because the first copy to capture the attention of scholars was found in the library of Cardinal Mazarin in Paris. Some times called the Gutenberg or the 42 line Bible.

Mean, In statistics and mathematics generally understood to be the arithmetic mean. The geometric mean between two quantities is the square root of their product. See Average.

Mechanical Equivalent of Heat See Joule.

Medals as decorations for military service were first issued in this country by Charles I. who ordered medals for gallantry to be distributed to certain soldiers in 1643. Medals were also issued to officers and men who were victorious against the Dutch fleet in 1653. After Lord Howe's victory in 1794 a naval medal was instituted. Medals were also struck for the victory of Waterloo and since that time special medals have been issued in connection with all our wars. The Victoria Cross, a special reward for personal gallantry in the Navy, Army and Air Force was instituted in 1856. The George Cross for gallantry instituted in 1940 ranks next to the Victoria Cross. The Military Cross was instituted in 1914.

Median See Average.

Medlar, a tree of which the fruit is about 1 in. in diameter and hard-fleshed when gathered, but after being stored for a few weeks it softens. It has a peculiar flavour. Its large white flowers give it a decorative appearance.

Meerschaum, a white or yellow-white earthy mineral found in beds in Asia Minor, Greece and other places; is a silicate of magnesium allied with water. Its chief use is in making pipe bowls.

Megalith, a prehistoric monument consisting of a large single stone or a group of such stones in a circle as at Stonehenge or in burial chambers as at New Grange, Ireland. Megalithic monuments have been constructed by different peoples in different parts of the world since the third millennium B.C.

Meiosis, a special type of cell division by which the gametes or sex cells are generated resulting in the sperm or ovum receiving only half the number of chromosomes found in a somatic cell. See Mitosis.

Mendelian Law, The first statistical rules of inheritance determining the ratio of variation of characteristics in the offspring of differing individuals and the classification of characters discontinuously inherited were first formulated by the Austrian monk Gregor Mendel. The results of his most important experiments in the crossing of peas were published in 1866 and showed that when two races are crossed the resultant hybrids will exhibit the dominant features of one parent but the offspring of the second generation will show those of both grand parents. See F47.

Mendicant Friars, certain religious orders which spread over Europe in the 13th cent. and comprised the Franciscans, Dominicans, Augustines, and Carmelites. Originally they depended entirely on alms.

Mercator's Projection, a method of indicating meridians and parallels of latitudes on maps introduced by Mercator in the 16th cent. and still universally used in navigator's charts.

Mercury, one of the smaller planets and the nearest to the sun, being 36 million miles distant. It has no satellite. See F7.

Mercury or Quicksilver, symbol Hg (Latin *hydrargyrum*) is one of the oldest-known metals whose chief ore is the sulphide cinnabar found in certain parts of Spain, China, Japan, Mexico and South America. It is liquid at ordinary temperature and is used in the construction of barometers and thermometers. Alloys of mercury are called amalgams. It is also of great value in medicine. The metal is used in the mercury vapour (or sunlight) lamp since the vapour gives a bright yellow-white glow in an electric discharge.

Mercy Killing See D9(2).

Meridian, an imaginary circle extending through the North and South Poles and any given place. When the sun is at its midday height at any place it is on the meridian, hence the terms ante meridian (a.m.) and post meridian (p.m.). See also Greenwich Mean Time.

Merino Sheep were imported into England from Spain in 1788 and had great influence in improving native breeds, especially in regard to the quality of the wool.

Mert Order, founded by King Edward VII in 1902 as a special distinction for eminent men and women without conferring a knighthood upon them. The Order has twenty four British companions in addition to foreign honorary members limited in number as the choice of members is by the Sovereign's pleasure. Lord Kelvin was the founder companion. General Eliott (1945) and Dr Sarvepalli Radhakrishnan (1963) are honorary members. Florence Nightingale (1907) and Professor Dorothy Hodgkin (1965) are the only women to have received this coveted decoration.

Mervings the name given to the family that ruled over France from about 500 to 750. Clovis was first of the line and Childeric the last.

Mesons (from Greek *mesos* = middle) a family of unstable particles of mass between that of an electron and that of a proton. Some are positive some negative some neutral. No stable meson is known the longest lived particle having a lifetime of only two millionths of a second. The first of these particles was discovered in cosmic radiation in 1937 and called the mu meson or *muon*. In 1947 a heavier type was discovered called the pi meson or *pion* which behaved like the meson predicted on theoretical grounds by Yukawa in 1935. The pion is connected with the theory of nuclear forces. See also F13 14.

Mesozoic The geological era which includes the Triassic Jurassic and Cretaceous rocks. See F44.

Metabolism the general term for the physical and chemical processes occurring within a living organism. See F28.

Metalloid an element which has properties intermediate between those of a metal and a non metal. Arsenic is a metalloid.

Metamorphic Rocks are such geological deposits as have undergone alterations of structure and mineral reorganisation. The most active agents in producing these metamorphic changes are heat water and pressure. See F8(2).

Metamorphosis period of development from egg to adult during which the animals have different forms as found e.g. in the life histories of frog and butterfly.

Meteorites The word meteor originally signified any natural phenomenon but in modern usage meteorites are small bodies coming from interplanetary space which become luminous by friction on entering the earth's atmosphere. Popularly called shooting stars. Larger meteorites are known as fireballs. Some of these reach the ground. The object which has been a meteor in flight then becomes a meteorite. In some meteorites iron is the predominating element others are like rock. The iron meteorites are more common amongst those which have been preserved but falls of rock-like meteorites occur more frequently. At Laigle in France in 1803 from 2000 to 3000 meteorite stones fell this fall is famous because it convinced scientists that meteorites really came from outside our atmosphere. (The largest meteorite stone actually known to have fallen to earth is one which descended in Emmott County Iowa in 1870 weighing 437 pounds.) A meteorite weighing no less than 364 tons found in Greenland is now in New York. On June 30 1908 an enormous object fell in Siberia in a sparsely inhabited region. A hot blast destroyed all trees within a radius of about 5-10 miles the explosion waves being recorded by barographs as far distant as London, Washington, and Batavia. For the next few nights there was in Europe in the northern sky brilliant illumination due to sunlight falling on clouds of dust at a great height in the atmosphere. Whether this dust had accompanied the object in its journey through space like the tail of a comet or whether the dust had come from Siberia is unknown. (Many Russian astronomers now believe this Siberian meteorite as it is commonly called was the nucleus of a small comet.) When the place where the object fell was visited in 1927 some 200 craters were found but no considerable

meteorite has been recovered. Meteorites are possibly debris from the disintegration of a body in the solar system.

Meteorology the science of the atmosphere considered as a heat engine. Deals with weather climate optical phenomena atmospheric electricity physical processes such as radiation and precipitation the dynamics and structure of cyclones anticyclones etc. Wide application to problems of aviation agriculture commerce and shipping. Meteorological observing stations are in operation all over the world and on the simultaneous or synoptic reports of their instrument readings and estimates of pressure temperature humidity speed and direction of wind rain character and amount of cloud visibility etc. forecasts of rain snow and frost warnings are based on instruments carried by earth satellites (e.g. *Tyros Nimbus*) outside the atmosphere can make systematic observations on a world wide basis of the atmospheric circulation through observation of cloud cover and of the thermal radiation into space from the atmosphere. Such observations together with the use of computers are of great importance for weather analysis and forecasting. The main communications centre for the U.K. is at the headquarters of the Meteorological Office at Bracknell Berkshire where the collection editing and retransmission of weather messages continue according to strict schedules day and night throughout the year.

Methane The simplest hydrocarbon compound of one carbon atom and four hydrogen atoms. This gas occurs over marshes and swamps where it is liberated in the decay of vegetable matter. It is the main constituent of natural gas and also occurs in coal mines where it is called fire damp because of the explosive character of its mixture with air. Formerly this natural gas was removed from the coal seams and ran to waste now in many countries (including Britain) it is being used for commercial purposes.

Methodism See J31.

Methylated Spirit a mixture of 90 parts by volume ethyl alcohol 91 parts wood naphtha (methyl alcohol) 1 part crude pyridine together with small amounts of petroleum oil and methyl violet dye. Industrial methylated spirit consists of a mixture of 90 parts by volume ethyl alcohol and 5 parts wood naphtha. It is used as a solvent and a fuel.

Metre See English Verse M30.

Metre unit of length in the metric system since 1981 the wavelength of the orange red light of krypton 86 has been adopted as the basis of the international unit of length. Before that (since 1889) the platinum-iridium bar kept at Sèvres was the international prototype metre.

Metric System the system of weights and measures based on the gramme and the metre smaller and larger units being decimals and multiples of the primary units respectively. A decimal currency was adopted in France in 1795 and the metric system of weights and measures in 1798. (In that year the quadrant of the earth was surveyed and the standard metre adopted.) Nevertheless the change was accepted slowly and as late as 1857 the French Government had to pass a law forbidding the use of the old measures. Since then the metric system has been adopted in most of the continental countries and is used universally in scientific work. Although there have been many attempts to get the system adopted in Britain it was not until 1965 that the Government announced that it was encouraging the adoption of the metric system of weights and measures. The change over to decimal coinage was made on 15 Feb 1971 the first of the new coins having been issued in 1968. See Section N for SI units.

Mezzotint an engraving from copper or steel produced by instruments which burnish and scrape away portions of the surface, and yield an impression effectually graded in light and shade.

Mica The mica of commerce is a nearly transparent parent mineral which has great heat resisting power and can be split into thin plates. The most important micas are muscovite (potassium mica) the commoner variety phlogopite (magnesium mica) and anthophyllite (magnesium and iron mica).

nesium mica) and biotite the magnesium and iron mica.

Michael St. and **George St.** an order of knighthood originally founded for the Ionian Isles and Malta in 1818 and reorganised in 1869 so as to admit Crown servants connected with the Colonies. The Earl of Derby, Earl Russell and Earl Grey were the first of the new knights.

Michaelmas Day the festival day of St Michael and All Angels. Sept 29th one of the English quarter days.

Microbe a term proposed by Sédillot in 1878 to denote any microscopic organism, vegetable or animal or found on the borderland between the two great natural kingdoms. The term is commonly used but not by scientists.

Microelectronics a rapidly developing technology of the 1960s which reduces entire electronic circuits to minute size and embeds them in tiny chips of solid material. These are then called integrated circuits. A circuit consisting of say a dozen transistors and fifty resistors can be built into a small piece of semiconductor (*q.v.*) measuring not more than a couple of millimetres in any direction. Hundreds of these circuits can be made simultaneously in *q.v.* size wafers of silicon about one hundredth of an inch thick. There are great advantages in cheapness, reliability, robustness and speed of electronic performance. The small size is in itself an advantage in space vehicles and medical instruments. Applications to missile control systems, computers and communications equipment are no doubt only the first fruits of this new achievement of the current technological revolution.

Micrometer an instrument for measuring minute distances, usually attached to the eye pieces of a microscope or telescope and consisting of two very fine hairs or wires stretched across the field of view one fixed the other movable. It was invented by William Gascoigne in the 17th cent and improved by later inventors. Sir Joseph Whitworth made one in 1858 to measure the millionth part of an inch.

Micro organisms the collective term applied to several types of organism the most important of which are fungi, viruses, bacteria and protozoa. It is a classification of convenience in biological studies. These organisms are generally simple in their environmental requirements (*e.g.* have simple nutritional needs) and in cellular organisation. This makes them very suitable for modern biological research. Much of the information on the nature of the genetic code (F31) was obtained from experiments on these organisms.

Microphone device for converting the acoustic energy of sound waves into waves of electrical energy used in sound amplifying systems. Developed independently by Edison (1877) and Hughes (1878).

Microscope invented about 1590 by Janssen, and improved by Galileo, Fontana and others is an instrument which by a lens system magnifies minute objects. Microscopes are simple compound, and binocular. The more powerful instruments have a magnifying capacity of as much as 10 000 diameters. See also **Electron Microscope**.

Middle Ages (*c.* A.D. 400-1500) usually considered to be the period between the decline and fall of the Western Roman Empire and the fall of Constantinople to the Turks (see A4-7). The period covers (a) an earlier part ending with the 12th cent. (sometimes called the Dark Ages) when science was dead, when theology was the main preoccupation, and when the language of the learned West was Latin; and (b) a later age of Arabian influence when alchemy and astrology (at that time indistinguishable from astronomy) were central interests; technology was advancing and Greek learning was transmitted by Arab scholars. Characteristic features of the mediaeval scene were monasticism (J33), the Crusades (*q.v.*), Gothic art (*q.v.*), feudalism (J20) and the supremacy of Islam in the field of learning. The period came to an end with the ushering in of the Renaissance (J44).

Midrash name given to the homiletical interpretation of some of the Hebrew Scriptures in which allegory and legendary illustration were freely

used. Compiled by Jewi h rabbis from c. A.D.

Millenary Petition was presented to James I. in 1603 on behalf of nearly 1 000 Puritan Ministers against certain of the rites and ceremonies of the Church of England. The Hampton Court Conference was the outcome of this petition.

Millennium a period of a thousand years. The term is specifically used of the period of a thousand years during which according to Rev. xx. 1-5 Christ will reign in person on earth. The Millenarians are a sect that interprets the Millennium as beginning with the commencement of the 6001st year from the Creation which according to Archbishop Usher (1581-1650) was in 4004 B.C.

Millipede Arthropods (F33) allied to the centipede, from which they differ in having two pairs of legs on each body segment (except the first three) instead of one pair. Worm like in shape but with a pair of antennae on the head they can do much harm to garden plants. See T29(1).

Millstone Grit a series of grits and sandstones of delicate origin underlying the coal measures of the Carboniferous system and attaining in England a thickness in parts of 5 000 ft. It is from this rock that millstones have been made from time immemorial.

Mimicry protective similarity of an animal to another animal or to inanimate objects. Examples of the former are the hover flies which mimic wasps and bees of the latter leaf insects, stick insects and caterpillars that look like dead twigs.

Mink Semi aquatic mammals closely related to polecats. There is one American species and one European. The fur which varies from dark brown to soft and thick and is among the most valuable of commercial furs. They now live in the wild in the British Isles.

Minnesingers were medieval poets of Germany who during the 12th and 13th cent. composed and sang verses of heroism and love. They were of knightly rank, the counterpart of the French troubadours. See E3(2).

Minnow a small fresh water fish of the carp family abounding in all the waters of Europe. It has a mottled back and silvery belly and forms a popular bait for trout.

Minstrels were originally specially appointed instrumentalists and singers—pipers, harpers and gleemen—engaged by barons and manorial lords to amuse their tenants. Later minstrels assumed nomadic habits made their way into the houses of the great and were generally welcome. By Elizabeth's time however they were too numerous and were classed as rogues and vagabonds along with actors.

Miracle Plays popular in England in the 15th cent. were usually religious in character representing some of the dramatic incidents of the Bible. Staging of plays was one of the many activities of the Guilds of those days. See M41.

Mirage an optical illusion often observed in desert regions when the objects on the surface of the earth often some distance away appear as if reflected in a surface of water. Mirage is due to the unusual heating of the different parts of the atmosphere which bends the light rays and so produces distorted images.

Mishna, the first part of the Talmud setting forth the Oral Law of the Jews.

Missal the name of the mass book of the Roman Church compiled 492-96 by Pope Gelasius I. and revised by Gregory I. 590-604. The present Roman Missal was sanctioned by the Council of Trent 1545-63. In the Anglican Communion the Book of Common Prayer superseded the Missal in 1549.

Mistle Thrush receives its name from its partiality to the mistle berry. Larger than the song thrush with spotted breast rather than speckled. Mistletoe, a parasitic evergreen with white berries used as a decoration at Christmas time. The familiar mistletoe of Europe is the *Viscum album* which grows on the boughs of lime, willow, apple, poplar, maple, ash, hawthorn but seldom on oak trees. It was sacred to the Druids and in Norse mythology it was a mistletoe dart that killed the god Baldr.

Mistral, a cold dry, northerly wind peculiar to the French coast of the Mediterranean.

Mitosis, cell division whereby each daughter cell

receives the same number of chromosomes as the parent cell. When the gametes (sex cells) are formed a special type of division occurs (meiosis) in which the number of chromosomes is halved. See F30(2)

Mitre the twofold pointed head dress of bishops and certain abbots of the Western Church and occasionally of other ecclesiastics

Moa the name for several species of ostrich like extinct birds related to the New Zealand kiwi. The large species *Dinornis maximus* stood 8 ft 7 in high. Became extinct about 500 years ago.

Mosaic Stone a stone of the 9th cent. n.c. containing the earliest known inscription in Phoenician characters, and discovered in the highlands of Moab in 1868. It is now in the Louvre, Paris. It records the campaign between Moab and Israel, a differing account of which is given in the Old Testament.

Mode See Average

Moderator a material used to slow down neutrons in an atomic pile. Examples of moderators are pure graphite and heavy water. See Nuclear Reactors

Mohole Project a scheme to bore through the earth's crust to take samples of the mantle rocks beneath. Drilling trials led by an American team of geophysicists began in 1961 near the island of Guadalupe off the Mexican coast in the Pacific. The project however was cancelled in 1966 on account of the escalating cost. Russian geophysicists have already started on a similar experiment but are boring through land rocks where the drilling will have to be much deeper and higher temperatures are likely to be met with. The name 'Anth Cosmo' has been given to the project. The boundary between the earth's crustal and mantle rocks is known as the Mohorovicic Discontinuity or more simply as the Moho. See F2(1)

Molasses sugar cane juice in its uncrystallised form after boiling. The crystallised part is the raw sugar. Used to make rum.

Mole a burrowing animal with long sensitive nose about the size of a small rat with short legs and forefeet armed with strong claws for digging in the earth. Their subterranean dwellings are of curiously ingenious construction and they do not often leave them except to make raids on mole frogs snails etc. The earth worm however is the mole's chief item of food. Not to be confused with the vole which has a blunt nose.

Mole, or gram molecular weight. See F21(2)

Molecular Biology a rapidly expanding branch of science mainly concerned with cell structure and function at a molecular level in particular with genes and enzymes and the interaction between the two. Recent work in Britain has led to the unravelling of the structure of DNA, the hereditary substance of the genes and has played a major part in uncovering the molecular mechanism of the transfer of hereditary information and the nature of the genetic code. Crystallisation of the first enzyme (uracase) took place in 1929, the gene as a definite chemical entity was discovered in 1943. See F26-32

Molecule A group of atoms held together by chemical forces. See F12(2) 20 also Macro molecule

Molybdenum symbol Mo a fairly hard white metal with properties resembling those of chromium. Its commonest ore is the sulphide molybdenite. The chief use of the metal is in the manufacture of alloy steels.

Monasticism. See J33

Monazite a cerium mineral containing some thorium. Occurs as grains often as sand (monazite sands) derived from granites. Deposits occur in India (Travancore) Russia Norway Madagascar S Africa Brazil U.S.A.

Monday the second day of the week called by the Anglo-Saxons *Monandæg* (moon day)

Mongoose, species of mammals related to the civets feeding on vermin and reptiles. These animals which have long tails and short legs occur in Africa and Asia (especially India). The biggest mongoose is the Egyptian ichneumon, and this has been introduced into the W. Indies because of its ability to kill large poisonous snakes.

Monitor a family of lizards most resembling dragons. There are about 80 species widely

distributed over the tropical parts of America, Australia and Africa.

Monroe Doctrine a principle of American policy declining any European intervention in political affairs of the American continent outlined by President Monroe in 1823. At the same time interference was disclaimed with existing European colonies in the Western Hemisphere. The American Civil War hampered the application of the doctrine for some time but afterwards the United States firmly insisted on it. The Doctrine is not international law but a national policy of the U.S.A.

Monsoons regular persistent winds which blow at certain seasons in middle latitudes mainly in South and East Asia. Their occurrence is related to the great changes of pressure which take place between summer and winter over the land mass. In India the south west monsoon (June-Oct.) is moisture laden from its long passage over the sea and in the higher regions especially there is heavy rainfall. Sudden reversal of the wind results in the cold north east monsoon (Oct.-March) which is dry on account of the shelter afforded by the mountain ranges to the north. Frequently the term monsoon is applied to denote the associated rainfall without reference to the actual winds.

Monstrance an ornamental transparent receptacle in which the Sacred Host is carried in procession or exposed for adoration.

Month the 12th part of the calendar year. A lunar month is the interval of new moon to new moon or full moon to full moon. Mean length 29 days 12 hours 44 minutes 2.87 seconds. A sidereal month represents the time of the moon's revolution from a given star back to the same again 27 days 7 hours 43 minutes 11.7 seconds. In English law since 1926 a month unless otherwise expressed means a calendar month.

Monument of London a 202 ft column overlooking Billingsgate designed by Wren and erected (1671-77) to mark the starting point of the Great Fire of London (1666). The original inscription upon it ascribed the fire to the treachery and malice of the papal faction which stood down to 1831 when the words were erased as objectionable. The black marble staircase has 345 steps (311 to the balcony).

Moon, the earth's satellite 2 160 miles in diameter and 238 857 miles distant from the earth. It rotates in the same time as it revolves round the earth (27 days 7 hours 43 minutes) so that the same face is always presented to the earth. The lunar surface is pockmarked by innumerable collisions with solid particles of all sizes. Unlike the earth it is unprotected by any atmosphere and for aeons of time it has been exposed to every kind of cosmic influence including the parching effect of solar radiation. All moonlight derives from the sun but on the whole it is a pretty poor reflector. The exploration of the moon by means of rockets began in 1959 when the Russian *Luna 2* crashlanded on the plains of the *Mare Imbrium*. 1969 will be remembered as the year of the U.S. *Apollo* triumphs when man first set foot on the moon. The samples of lunar rock and dust brought back to earth are now being studied by lunar scientists but it is unlikely that the great problem of the history and structure of the moon will be satisfactorily solved until a geologist gets to work with his hammer on the spot. The exploration of the moon at close range by means of spacecraft was made possible only by parallel developments in several branches of technology—rocket propulsion long range radio and television transmission electronic computer control. See also F54-7

Moorhen a widely distributed bird of the rail family a common resident in the British Isles. The adult is blackish with white under tail coverts, a white line on the flanks and a yellow tipped bill. The frontal shield and the base of the bill are vermillion. It bobs its head like its tail and dives well. The nest is usually placed close to the water's edge or on an overhanging branch. In feeding the young the parents are sometimes helped by their offspring of a previous brood of the season. In N. America the bird is known as the Florida Gallinule.

Moors the name given to the Moslems who live in N.W. Africa and to those who once lived in Spain.

In 711 Moorish Arabs invaded Spain and spread beyond the Pyrenees into France where they were driven back by the end of the century. Spain however remained virtually under Moorish domination until the 11th century and during that period was the most civilized and prosperous part of Western Europe. In the arts and sciences the impact of Moorish culture was profound and lasting. Example, of the brilliant splendour of Moorish architecture are still to be seen in Toledo, Cordoba, Seville and Granada. During the long struggle for the Christian reconquest thousands were killed and expelled and in 1492 Granada their last remaining kingdom was forced to surrender. They were virtually exterminated by the Inquisition and the last were expelled in 1609.

Moose the largest members of the deer family. The N. American Moose stand 54-64 ft. high and has huge palmate antlers. There is another New World species occurring in Alaska. The European species is known as the elk.

Morse Alphabet a system of dots and dashes intended to be used in combination with the indicator in telegraph but usually read by sound the receiving operator writing down the words in the system as transmitted. This system of signals was invented by the American inventor and artist Samuel F. B. Morse (1791-1872) of Charlestown, Massachusetts.

Mosaic art of arranging small pieces of coloured glass, marble or other materials in such a fashion as to produce a decorative pattern. Some of the best examples of Byzantine mosaics are to be seen at Ravenna, Rome, Venice and Sicily.

Mosque a Mohammedan church, the greatest being that of Santa Sophia at Istanbul, now converted into a museum of Byzantine art.

Mosquito small two winged flies with long legs and slender body. Their larvae are aquatic. The females of some species are blood suckers, and thus come to transmit the blood parasites which cause malaria and yellow fever for example. See DDT and Gammaxane.

Mosses Most mosses live in moist habitats but there are some species that can withstand desiccation and are adapted to live on rocks and tree trunks.

Moths of the insect order *Lepidoptera* differing from butterflies which have clubbed antennae in having feathery sometimes thin pointed antennae rarely clubbed. Most are nocturnal and the pupae are usually brown and enclosed in a cocoon unlike those of the butterfly which are usually naked. See also *Lepidoptera*.

Motion Laws of. According to Newton (1) A body continues in its state of rest or uniform motion in a straight line except in so far as it is compelled by external forces to change that state. (2) Rate of change of momentum is proportional to the applied force and takes place in the direction in which the force acts. (3) To every action there is an equal and opposite reaction. These laws are the basis of almost all engineering and everyday mechanics. Corrections to them have been made by relativity and the quantum theory. See F15 16.

Mule a cross between a male ass and a horse mare, a hinny is a cross between an ass mare and a horse stallion. Also the name of the spinning machine invented by Crompton in 1779 which combined the principle of Hargreaves spinning jenny with the machine invented by Arkwright.

Mullions the vertical bars dividing the lights in a window forming a highly decorative feature in the Tudor period of English Gothic architecture. The cross beam or horizontal bar of wood or stone in a mullioned window is styled a transom. See Windows.

Munich Agreement In Sept. 1938 Mr Neville Chamberlain and M. Daladier British and French Premiers reached agreement with Hitler at Munich for the dismemberment of Czechoslovakia primarily for the benefit of Germany. Czechoslovakia itself was not consulted nor Russia who with Britain and France had jointly pledged themselves to uphold the independence of Czechoslovakia. Hitler had been threatening that country for

some time but every concession had been met by further demands. After three visits to Germany during which Hitler raised his demands the British and French statesmen gave way. Mr Chamberlain declared on return that he had secured 'Peace in our time'. The Agreement was the subject of much controversy. Hitler seized Czechoslovakia in March 1939.

Muscles See F34(1).

Musk Deer a small deer of the Himalayas standing about 20 in. high. It is grey in colour slightly brindled and carries a small pouch in the abdominal region containing what is commercially known as musk in article which is of great value in the manufacture of various perfumes. The active constituent of musk muscone is now made synthetically. The species was becoming rare on account of its slaughter for its musk.

Mutton Bird, an Australasian name of controversial origin for a shearwater or petrel e.g. the Short-tailed and Sooty Shearwaters and the Great-winged Kermadec and White-headed Petrels. The young are taken by hand from their burrows for human food.

Myrrh a resinous substance obtained from a tree of the natural order *Amygdaceae* growing plentifully in Abyssinia and Arabia. Its use for embalming, medicinal and aromatic purposes may be traced back to the most remote times.

Mystery a secret mystic ceremonies of the ancient Greeks, religious drama accompanied by dancing the most well known being the Eleusinian and Orphic ceremonies.

Mystery Plays were medieval religious dramas performed by priests at great ecclesiastical festivals particularly in France and Bavaria, staging the Nativity Passion and Resurrection. See M41.

N

Nadir one of the two poles of the horizon the other being the zenith. The nadir is the pole vertically below the observer's feet.

Nahum, one of the books of the Minor Prophets of the Old Testament. It is a prophecy of doom on the approaching sack of Nineveh which fell in 612 B.C. to the Medes and Babylonians.

Nantes Edict of was a decree promulgated by Henry IV of France in 1598 giving full freedom of worship to the Protestants of the country. It was the revocation of this edict in 1685 by Louis XIV that drove hundreds of thousands of French Huguenots to this country.

Naphtha, a highly combustible believed to have been one of the ingredients of Greek fire. Naphtha is a light highly inflammable oil obtained by distilling petroleum shale oil or coal tar. The petroleum naphtha consists of a mixture of paraffins that from shale contains olefines as well as paraffins. Coal tar naphtha contains xylol.

Naphthalene is an aromatic hydrocarbon it is obtained from coal tar and its derivatives are much used in the manufacture of colours for dyes and printers. Moth balls are made of naphthalene.

Narcotic a medical dictionary definition is that a narcotic is a drug that produces stupor complete insensibility or sleep. In terms of drug addiction a narcotic has been defined as altering and distorting the user's perception of himself and of the external world being taken primarily for that purpose. See P22-24.

Nardus a genus of coarse grasses growing on bleak upland heaths and hill slopes. *Nardus stricta* known as mat weed is a British species.

Narghile, an oriental tobacco pipe so constructed that smoke passes through water and up a long flexible tube before reaching the lips of the smoker.

Narrative Art, a type of art popular during the late 19th century based on the principle every picture tells a story — e.g. such paintings as the little Royalist boy surrounded by his anxious family and confronted across a table by the Roundheads bearing the title 'When did you last see your father?' The term although often applied derisively suitably describes many works of considerable artistic merit e.g. Hogarth's *Marriage à la Mode* his series of eight engravings entitled *A Rake's Progress* the Bayeux Tapestry and many Babylonian and Egyptian frescoes.

Naseby Battle of was fought on June 14 1645 between the Royalists under the command of Prince Rupert and the King and the Parliamentarians under Fairfax and Cromwell. It resulted in a complete defeat for Charles.

National Anthem, a musical composition with words officially adopted for ceremonial use as an expression of patriotism and loyalty to a national cause. The national anthem of the United Kingdom is God Save the Queen which has been in use since about the middle of the 18th cent. There is some doubt about its origin. It has been variously attributed to Dr John Bull Henry Carey and James Oswald. National Assembly the name taken by the body responsible for the opening stages of the French Revolution and subsequently by other sovereign bodies in France and elsewhere.

National Covenant an oath and declaration subscribed to by the Scottish Presbyterians in 1638 to maintain their religion against Charles I's episcopalianising designs.

National Gallery established in 1824 at Pall Mall London with the Angerstein Collection of 38 pictures purchased for £30,000 as a nucleus. The existing building which was opened in 1838 has been enlarged several times. The National Gallery at Millbank, the Tate Gallery was given to the nation by Sir Henry Tate in 1897.

Nationalisation is the taking over by the State of the ownership and operation of an industry or service—e.g. coal mining railway transport gas and electricity. Where this is done without revolution compensation is usually paid to the previous owners at what is regarded as a fair market price. The compensation is some times paid in cash but more often in fixed interest bearing bonds issued either by the State or by the administration of the nationalised service which is usually a publicly appointed Board or Corporation acting with greater or lesser autonomy under the direction of a Minister responsible to Parliament. In some cases the State becomes a partner with private investors in the ownership of a particular enterprise e.g. oil companies such as the former Anglo-Iranian and some recent French examples. Nationalisation is usually brought about by a separate Act of Parliament relating to each industry or service taken over. These Acts in Great Britain include provision for joint consultation at all levels between the administering boards or commissions and the workers employed and their Trade Unions. When as in the Soviet Union nationalisation occurs as an outcome of social revolution no compensation is paid to the dispossessed owners.

National Parks. Under the National Parks Act 1949 a National Parks Commission was set up to create National Parks in England and Wales. Ten have been established. Peak District Lake District Snowdonia Yorkshire Dales Exmoor Brecon Beacons Dartmoor Pembroke shire Coast North Yorks Moors and Northumberland. They cover an area of some 5,260 square miles or 9 per cent of the total area of England and Wales. It is not intended to change the character of these territories but to control their development so as to harmonise with the two dominant principles (a) that the characteristic beauty of the landscape within the Park area shall be preserved and (b) that the visiting public shall have ample access and facilities for recreation and enjoyment. The National Parks Commission also has power to designate areas in England and Wales outside the national parks as areas of outstanding natural beauty. Twenty seven areas had been designated by 1971. Gower Quantock Hills Llyn Surrer Hills Dorset Northumberland Coast, Cannock Chase, Shropshire Hills, Malvern Hills, Cornwall N Devon S Devon E Devon E Hampshire Isle of Wight Forest of Bowland Chichester Harbour and Solway Coast, Chilterns, Sussex Downs Cotswolds Anglesey South Hampshire Coast Kent Downs, Norfolk Coast Dedham Vale and Suffolk Coast and Heaths. Under the Countryside Act 1968 the National Parks Commission has been reconstituted as the Countryside Commission. See also Long Distance Routes.

National Physical Laboratory situated at Teddington is one of the world's largest and best

equipped laboratories. It was first established in 1900 under the control of the Royal Society. In 1964 it became part of the Ministry of Technology. It conducts research in its three main groups: Measurement Materials and Engineering Sciences and maintains British primary standards and physical units.

National Portrait Gallery established in 1856 and now located in a building in St Martin's Lane adjoining the National Gallery. Contains portraits of eminent people in history literature art etc and a valuable collection of medals and autographs.

National Trust founded in 1895. A non profit making organisation incorporated by Act of Parliament for the purposes of promoting the permanent preservation of lands and buildings of historic interest or natural beauty for the benefit and access of the people. As a consequence of gifts of public spirited individuals the Trust now owns many acres of magnificent scenery and property including mediaeval castles bird sanctuaries ancient monuments birthplaces and homes of famous men and classic examples of domestic architecture preserved for the enjoyment of present and future generations. Since 1946 lands and houses of interest to the nation may be given to the National Trust in lieu of death duties.

Nativity. There are three nativity festivals of the Christian Church. Christmas 25 Dec festival of birth of Christ the birthday of the Virgin Mary (8 Sept.) and of St John the Baptist (24 June).

Natterjack, a curious warty prominent eyed brown toad (*Bufo calamita*) having a bright yellow line down the middle of its back. It utters a muttering sort of croak hence its name.

Natural Law. See 385.

Naturalism in painting has been defined as a direct and spontaneous approach to nature—to landscape primarily. Constable Turner and Boudin were among the great naturalist painters of the 19th cent. See Section I for naturalism in drama.

"**Nautical Almanac**" published under the authority of the Admiralty is always issued four years in advance and contains information specially prepared for the use of navigators and astronomers. It first appeared in 1767.

Nautilus a term now applied only to the pearly shelled nautilus the sole surviving example of the four gilled section of the *Cephalopoda*. Its fossil relatives are called Ammonites. The spiral shell is divided into a number of compartments the animal living in the last and largest chamber. There are three or four species all living in tropical seas. The Paper Nautilus is not related to the Pearly Nautilus belonging to the same order as the octopus.

Nave is the body or main open portion of a cathedral or church and extends from the chancel entrance to the choir or chancel and is usually flanked by aisles. A nave in mechanics indicates the hub or central part of a wheel.

Neanderthal the name of the valley lying between Düsseldorf and Wuppertal where in a limestone cave a now famous skull of a very early species of prehistoric man was discovered in 1856. Fossils of Neanderthal man have been found over a wide area and from archaeological evidence he began to disappear from Europe during the last Ice Age about 40,000 B.C. See 246(2).

Necromancy the black art was in olden times much believed in and supposed to be an occult power by which its practitioners could converse with the spirits of the dead and learn the future.

Negroes are the dark skinned woolly haired races natives of tropical Africa, or descendants of such natives. There are many different racial types including the Ashanti of Ghana the Kikuyu of Kenya the Yoruba of Nigeria the Pygmies (nomadic hunters living in the equatorial forests) the Bushmen of the Kalahari Desert the Hottentots of South Africa (who have largely lost their identity) the so-called Bantu peoples of Central and Southern Africa, and many others. Their culture is rich in folk lore, and they have great artistic gifts in music dancing and sculpture. About 25 million people of Negro descent are in N and S America, the European slave trade having taken them there from their homes in W Africa. See also African Languages M43.

Negus the name given to any mixture of wine and water and said to have been named after Colonel Francis Negus about 1714. The sovereign of Abyssinia is styled the Negus.

Nekton term used to differentiate actively swimming aquatic organisms (e.g. fishes) from the drifters or plankton.

Nelson Column in Trafalgar Square London designed by Mr William Railton was chosen from among a number of designs—temples, obelisks and various sculptural groups—sent in as a result of a competition held in 1889. The erection of the column was begun in 1840. Twenty six years later the lions designed by Landseer were set up at the foot of the completed column. The statue of Nelson himself was made by D. H. Bailey and the bronze reliefs at the base executed by Carew Woodington Ternouth and Watson representing the Battles of the Nile St Vincent Copenhagen and Trafalgar. Height 170 ft. executed in Portland stone instead of granite as originally planned at a cost of £46 000.

Nene or Hawaiian Goose. At the Severn Wild fowl Trust at Slimbridge Mr Peter Scott has saved this bird from extinction.

Neo Classical School of Art, a French school of painting and sculpture belonging to the late 18th and early 19th cent and founded by Jacques David the Academician republican and later admirer of Bonaparte. His classicism probably arose from his republican sympathies which caused him to paint such works as the *Oath of the Horatii* (Louvre) drawing analogies between revolutionary France and Rome. Because of these views he revolted against the romantic and sensual art of Watteau and Greuze and equally against the realism of Chardin. Among his many famous pupils was Ingres who later assumed leadership of the school.

Neodymium an element belonging to the rare earth metal group. Discovered by Welsbach in 1885.

Neo-Impressionism a development of Impressionism (q.v.) by Seurat and Signac during the 1880s who reversed the method of painting known as *pointillism* (the application of pure colours in minute touches to form a composite whole based on a knowledge of the laws of colour and optics). One of the best known examples of this technique is Seurat's *Sunday Afternoon on the Grand Jatte*.

Neon inert gas present in air to the extent of about 1 part in 65 000. The crimson glow produced when an electric discharge passes through the gas is familiar in advertising signs.

Neoprene generic name for a class of synthetic rubbers made from acetylene.

Nepotism, the bestowal of patronage by reason of relationship rather than of merit. It had its origin in the custom of certain Popes to enrich their families out of the offices of the Church.

Neptune Apart from Pluto this is the most distant of the planets estimated to be about 2 793 million miles from the sun and taking about 165 years to revolve around it. Discovered by the German astronomer Galle on Sept. 23 1846 after its existence had been predicted by Leverrier and Adams.

Neptunium element 93 one of the four new elements discovered during the progress of the atomic bomb project in the second world war. Neptunium is formed when a neutron enters a nucleus of Uranium 238 and it decays radioactively to yield plutonium.

Neutrino a neutral particle which carries energy and spin and although possessing little or no mass plays an important part in the interaction of other fundamental particles. The discovery that there are in fact two distinct neutrinos each with its counterpart was discovered in 1962 as a result of an experiment made with the 30 000 million electronvolt proton accelerator at Brookhaven. See F14.

Neutron a neutral particle present in all atomic nuclei except the hydrogen nucleus which is a single proton. In the development of nuclear science and technology the neutron has played a most important role and neutrons produce the radioisotopes now widely used in medicine agriculture and industry. Neutrons and protons are termed nucleons. See F10 14.

New Deal The measures taken by President Roosevelt in U.S.A. in 1933 to overcome the

great economic crisis which broke out at the end of 1929 and to restore the social security threatened by it. The measures were drawn up by a group of experts called a Brains Trust and they provided for recovery by a programme of public works including large scale construction of houses and large scale assistance to farmers. Loans were granted and authorities formed to stimulate activities which reduced the workless from 17 millions to between 7 and 10 millions. Unemployment relief was regulated and enlarged and social insurance (which for decades had been a subject of dispute being held to be contrary to American principles of self help) was introduced. Many of the changes have become a permanent part of American legislation though some laws were repealed by the U.S. Supreme Court as being unconstitutional.

Newgate Prison now pulled down and replaced by the Central Criminal Court opened in 1807 was situated near the point where once stood one of the old London city gates. There is a record of a prison upon this spot in the 18th cent. Later a new one was built by the executioner of Richard Whittington, but this was destroyed by the Great Fire in 1666. Still another new prison on this site was erected between 1773 and 1780. In the Gordon Riots of the latter year it was destroyed by fire and re-erected. It was not used as a prison after 1880.

News Letters were an early form of newspaper popular in the time of Charles II. They consisted of items of news and gossip collected at the various coffee houses and other places of public resort. They often included blank pages on which readers wrote their private letters.

Newspapers The first news books to be published at regular intervals in Britain appeared in 1662 with news of what was going on abroad translated from German and Italian news sheets. Licence to print was obtained from the Star Chamber, which until its abolition in 1641 allowed only the printing of foreign news. With the lifting of the ban on domestic news the Press became free. In the reign of Queen Anne English newspapers employed writers of great intellectual power and versatility. Despite the newspaper tax introduced in 1712 the number of newspapers published in London in 1776 had increased to 53 though the standard of writing was below that of earlier times. The development of the Press was greatly assisted in the 19th cent by the abolition of the taxes on knowledge by the introduction of the cheap postal system and by improvements in printing distribution, collection of news and advertising. The *London Gazette* founded in 1665 (and still appearing twice weekly as the official organ of the Government) is the oldest newspaper living. The *Times* known throughout the world began as the *Daily Universal Register* in 1785 and adopted its present title in 1788. The *Manchester Guardian* (renamed *Guardian* in 1959) once a provincial but now a national newspaper with a world wide reputation began as a weekly in 1821 and became a daily in 1855. The *Scotsman* founded as a weekly in 1817 and established as a daily in 1855 and the *Glasgow Herald* which began as the *Glasgow Advertiser* in 1783 are the leading Scottish newspapers. The *London Press* which is national publishes 10 daily 2 evening and 7 Sunday newspapers.

Newt, amphibians of lizard shape and mottled markings. There are three British species, the largest being the Great Crested Newt (*Triturus cristatus*) which attains a length of 6 in.

Newton, the unit of force in the S.I. system of units. Under its influence a body with a mass of 1 kilogramme will accelerate at a rate of 1 metre per second each second.

Newton's Rings, concentric circular rings, due to the phenomenon of interference which are seen around the point of contact of a slightly convex lens with a flat plate of glass.

New Towns The new towns in Britain established under New Town Acts 1946 1959 and 1965 with dates of designation are Basildon (1949) Bracknell (1949) Corby (1950) Crawley (1947) Cwmbran (1949) East Kilbride (1947) Glenrothes (1948) Harlow (1947) Hatfield (1948) Hemel Hempstead (1947) Newton

Lycliffe (1947) Peterlee (1948) Stevenage (1949) Welwyn Garden City (1948) Cumber-
pruit (1948) Dawley (1963) Irvine (1966)
Irrington (1962) Milton Keynes (1967) New
town (mid Wales) (1967) Peterborough (1967)
Pidditch (1964) Runcorn (1964) Skelmersdale
(1961) Washington (1964) designated under
Town Development Act 1962 Killingworth
(1959) and Cramlington (1963) designated
under New Towns Act of N Ireland 1965
(Rusavon (1966) and Intrim/Ballymena (1967)
In addition a new regional city is to be built in
the Preston-Jeyland-Chorley area of Lanca-
shire and the new town of Dawley with neigh-
bouring Wellington and Oakengates forms
the new town of Telford. It is also proposed to
expand Ipswich Northampton and Warrington
and to build cities along the Tyne Solway and
Humber estuaries

New Year's Day Jan 1 The first New Year's
festival of which we have record is that consti-
tuted by Numa 713 B.C. and dedicated to
Janus

Nibelungenlied the German epic of the early 13th
cent. comprising numerous mythical poems
and songs of which several English translations
exist Wagner's *The Ring of the Nibelungs* was
based largely on Norse legends and on the
Nibelungenlied.

Nicene Creed a summary of the principles of
Christian faith first issued in 325 by the Council
of Nicea (summoned by the emperor Constantine
the Great) for the purpose of thwarting the
Arian heresy and asserting the godhead of Christ
Date of Easter fixed at Council of Nicea

Nickel silver-coloured metal symbol Ni fairly
soft though harder than iron. Chief source of
the metal is the nickel sulphide in iron-copper
pyrites deposits in Ontario. Chief uses are in
electroplating in coins as an element in alloy
steels. A novel method of making pure nickel
(by treating the metal with carbon monoxide
and heating the resulting liquid nickel car-
bonyl) was developed in 1890 by Mond. This
discovery led to many technical advances in
industrial chemistry one of which is the pro-
duction of catalysts for a variety of processes

Niello Work was in considerable vogue in the
Middle Ages and is said to have suggested the
idea of engraving upon copper. It was pro-
duced by rubbing a mixture of silver lead
copper sulphur and borax into engravings on
silver and some highly decorative results were
obtained

Night Heron a stocky short legged heron of black
and white plumage red eyes and yellowish
legs crepuscular except in breeding season, and
an occasional visitor to Britain

Nightingale, a familiar singing bird which visits
the southern counties of England every sum-
mer and is sometimes found as far north as
Yorkshire. It is a shy brown bird not often
seen, but the song of the male usually heard in
the late evening or at early morn is of re-
markable sweetness and variety. After its
wooing period is over its song ceases

Nightjar nocturnal insectivorous bird owl like
in appearance with mottled brown plumage of
dead leaf pattern, and a churring song. It
is a common breeding visitor to the British Isles.
Apr to Sept and lays its eggs on bare ground.

Niobium is a metal element symbol Nb related to
vanadium. Technical development has been
slow because of its rare occurrence although
niobium is now used in ferrous alloys to in-
crease resistance to corrosion and produce steel
which can be used at high temperatures

Nitre or Saltpetre is now mostly manufactured by
the double decomposition of sodium nitrate and
potassium chloride. Its chief use is the
manufacture of gunpowder and fireworks. It
has been manufactured in England since 1625

Nitrogen a non combustible gaseous element
symbol N devoid of taste or smell and con-
stituting nearly four fifths of the atmospheric
air. Nitrogen compounds are essential to
plants and animals, and are used in fertilisers

Nitro-Glycerine an explosive yellow fluid pro-
duced by mixing small quantities of glycerine
with a combination of one part of nitric acid
and two parts of sulphuric acid. By itself it
is a dangerously explosive substance to handle.
In 1867 Nobel produced dynamite a safe

explosive made by absorbing nitro glycerine in
kieselguhr

Nitrous Oxide a compound of nitrogen and oxygen
possessing mild anaesthetic power. Termed
laughing gas on account of its exhilarating
effect. It is still used in dentistry and for
minor operations and has proved useful in a
new technique for finding leaks in water mains.
Nobel Prizes The Nobel Foundation was estab-
lished at the beginning of the century to give
effect to the wishes expressed by Alfred Nobel
in his Will. By the terms of the Will the judges
are the Swedish Academy of Science the
Caroline Medico Surgical Institute the Swedish
Academy and five members of the Norwegian
Storting. The award of a Nobel Prize is
accepted as the highest form of international
recognition in the field in which it is given.
physics chemistry medicine literature peace
and since 1969 economics. See L126-8

Nones were dates of the Roman calendar which
fell on the 5th of each month excepting Mar-
ch May July and Oct. when they fell on the 7th.
Non Nobis Domine! (Not unto us O Lord!) a
musical canon sung as a grace at public feasts
(traditionally attributed to Breda)

Norman Architecture is English Romanesque
(qv) which flourished from the time of the
Norman Conquest and was gradually super-
seded through a transition period (c. 1175-1200)
by the introduction of the pointed arch charac-
teristic of the Early English (first Gothic style).
Typical of Norman churches are the round
arches thick walls massive cylindrical columns
with throughout the basic pattern of the square
and the circle. Some churches (e.g. the
Temple church in London or the chapel at
Ludlow Castle) are wholly circular. Roofs in
the early days were flat and towers usually
placed at the crossing were square but
occasionally round the spires of all these
towers have perished but it seems likely that
they were squat and pyramidal.

North East Passage from the North Atlantic to
Bering Strait has been rapidly developed by the
U.S.S.R. in recent years as a northern sea route
to render accessible vast areas of northern Si-
beria. Attempts to find a north east passage
were made by Englishmen and Dutchmen in the
16th cent. but they were always defeated by the
ice for the sea is completely frozen for some
3 000 miles for 9 months of the year. A Swede
succeeded in sailing from Europe to Japan via
the Arctic in the late 19th cent. See also
Arctic Exploration.

North-West Passage from the Atlantic to the
Pacific through the Arctic Seas has been the
dream of navigators for centuries. Attempts
to find it were made in the 16th and early 17th
cent. by John and Sebastian Cabot Frobenius
Gilbert Davis Hudson and Baffin. Two
centuries later Ross Parry Franklin and others
made the attempt but it was not until 1903-5
that Amundsen discoverer of the South Pole
made the complete voyage in the *Gjøa*. The
Canadian icebreaker *Labrador* was the first
deep draft vessel to traverse the North West
Passage (1954) and the U.S. tanker *Manhattan*
was the first commercial vessel to do so (1969).

Notre Dame the famous Paris cathedral was
founded in 1163 and is one of the finest spec-
imens of Gothic architecture in Europe. The
best descriptions of the buildings are to be found
in Victor Hugo's *Hunchback of Notre Dame*

November the 9th month of the year originally
but from c. 700 B.C. when Numa added Jan
and Feb. it became the 11th month.

Nuclear Energy Atomic nuclei consist of protons
and neutrons joined in various proportions (F10).
The heaviest naturally occurring nucleus con-
tains 238 particles (92 protons 146 neutrons) and
is uranium 238 (U^{238}) the lightest is hydrogen
which consists of 1 proton. Neutrons and
protons attract one another by very strong
forces which are not at all well understood they
are called *nuclear forces*. Consequently it
requires energy to be supplied if a nucleus is to
be pulled apart into its constituent particles.
The energy is required to overcome the attrac-
tions of the nuclear forces. Conversely when
the particles rush together to form a nucleus
energy is released in the form of heat or radia-
tion. The energy released when protons and

neutrons coalesce to form a nucleus is called *Binding Energy*. The binding energy of a nucleus divided by the number of particles involved is called the binding energy per particle which we will call *B*. It is very difficult to overestimate the importance of *B* to the human race. *B* varies from nucleus to nucleus, and the exact form of its variation is only roughly understood at the present time. But the most significant thing is that *B* is greatest for elements of medium atomic weight and lowest at the heavy (uranium) and light (hydrogen) ends of the periodic table. This means that if middleweight nuclei can be formed either from heavy ones or from light ones, *B* increases and energy is released in either case.

Nuclear Fission See F12(1)

Nuclear Fusion. If light nuclei are hurled at high speeds into intimate contact they sometimes coalesce and release binding energy (see Nuclear Energy). This has been studied in laboratories where powerful and energy consuming machines accelerate small numbers of particles for purely experimental purposes. If useful amounts of energy are to be gained these fusion reactions will have to occur on a bigger scale in an apparatus from which the resulting heat can be extracted in a controlled way. The one useful fusion device so far made is the thermonuclear bomb (H bomb). Thermo nuclear is the important word. If a suitable gas can be raised to a very high temperature the nuclei are stripped of their electrons and all particles move with very high speeds. The gas is then called a plasma. High enough temperatures will make speeds great enough for fusion reactions to occur and nuclear energy to be released. This is a thermonuclear reaction. For example, in deuterium gas at temperatures over a million degrees Centigrade the deuterium nuclei (1 heavy hydrogen nuclei consisting of 1 proton joined to 1 neutron) interact to produce helium nuclei. To obtain a net gain in energy from this process the temperature must be raised to about 300 million degrees C and maintained long enough, otherwise the energy released is less than that required to heat the fuel and to make up for heat losses. Many attempts to study the staggering technical problems are being made and fusion research is very active in Britain, the U.S.A. and Russia.

Nuclear Power Stations. Britain generates about 12 per cent of her electricity in nuclear power stations and the proportion is expected to rise to about 25 per cent by the mid 1970s. Britain has so far produced as much electricity by nuclear power as the rest of the world put together. The Atomic Energy Authority has five main stations at Calder Hall, Cumberland; Chapelcross, Dumfriesshire; the AGR station at Windscale, Cumberland; the experimental fast breeder station at Dounreay, Caithness; and the Steam Generating Heavy Water Moderated Reactor (SGHWR) at Winfrith, Dorset. The nine nuclear power stations operated by the electricity authorities are at Berkeley (1962), Bradwell (1962), Hinkley Point (1964), Hunterston (1964), Trawsfynydd (1964), Dungeness A (1965), Sizewell (1965), Oldbury (1967), and Wylfa, in Anglesey (1970). They have all been developed from the classic Calder Hall type burning natural uranium inserted in a graphite moderator and cooled by carbon dioxide gas. They are called Magnox stations because the fuel elements of natural uranium rods are encased in magnesium alloy cans. The second nuclear power programme for 1970-75 is based on the advanced gas cooled reactor system. Dungeness B is due to begin operating in 1972. Three further stations, Hinkley Point B (1972), Hunterston B (1973), and Hartlepool (1974) are under construction. The third programme planned for the end of the 1970s is to be based on the fast breeder reactor.

Nuclear Reactors are pieces of apparatus designed to permit nuclear chain reactions to occur under controlled conditions. (Uncontrolled chain reactions are dangerous *see* atomic bombs.) The success of a reactor depends on the neutrons reaching the U^{235} nuclei to produce more fissions and not being wasted in irrelevant processes or simply escaping through the wall of the appa-

ratus (neutrons are quite difficult to contain). The neutrons leaving the scene of fission are rapidly moving and they stand more chance of causing another fission if they are slowed down. Consequently a material other than the uranium has to be present to facilitate this and it is called a moderator. A useful moderator is pure graphite. Thus a reactor may consist of alternate blocks of uranium and graphite. If the reactor is too small so many neutrons escape that there are not enough to keep the chain reaction going. The reactor must therefore be greater than a certain *critical size*. In order to intensify or damp down the chain reaction it is arranged for pieces of neutron absorbing material such as cadmium to be inserted or withdrawn as required. While the chain reaction is proceeding countless numbers of fissions are occurring each one liberating energy which turns into heat. The temperature therefore increases and to prevent a catastrophic rise cooling has to be provided. The reactor therefore has cooling pipes through which a fluid coolant is pumped. The coolant carries the heat away and in a reactor designed to produce electrical power the heat is taken to steam raising boilers and the high pressure steam is led to turbines which drive the electric generators. What has been briefly described is the type of reactor first used for serious power production at Calder Hall. This is a graphite moderated gas cooled reactor using as fuel natural uranium (i.e. fissile U^{235} greatly diluted with U^{238}). It is also possible to make reactors work without slowing the neutrons with a moderator; these are called *fast reactors*. The design of the prototype fast reactor (FFR) at Dounreay due for completion in 1971 is based on experience gained with the Dounreay experimental fast breeder reactor which was the first in the world to produce electricity on a commercial scale (1962) and has achieved the highest power output of any of its type in the world. These fast reactors can produce new nuclear fuel in the course of their operation and therefore offer great economies. The British designed advanced gas cooled reactor (AGR) successfully developed at Windscale and chosen for the new Dungeness B and Hinkley B nuclear power stations promises to produce electricity more cheaply than conventional sources. The alternative method to nuclear fission is nuclear fusion (*see*). The problem of achieving a controlled thermonuclear reactor is one of the outstanding challenging problems of applied physics and although considerable understanding of the phenomena involved has been gained the solution is still as distant as ever. See also Breeder Reactor.

Nucleic Acids. Living matter is built up of cells each of which has a nucleus surrounded by cytoplasm. Cell nuclei are composed chiefly of substances called nucleoproteins which consist of a protein attached to a nucleic acid (see). The problem of achieving a controlled thermonuclear reactor is one of the outstanding challenging problems of applied physics and although considerable understanding of the phenomena involved has been gained the solution is still as distant as ever. See also Breeder Reactor.

Nucleic Acids. Living matter is built up of cells each of which has a nucleus surrounded by cytoplasm. Cell nuclei are composed chiefly of substances called nucleoproteins which consist of a protein attached to a nucleic acid (this original name is still used, although nucleic acids are found in the cytoplasm as well as the nucleus). Nucleic acids are complex organic structures made up of chains of compounds called nucleotides (F29(1)). Nucleotide molecules have a sugar group attached to a nitrogenous base and a phosphate group. Only two sugar groups are found in the nucleotides: ribose giving rise to ribonucleic acids (R.N.A.s found mainly in the cytoplasm) and deoxyribose which forms deoxyribonucleic acids (D.N.A.s found mainly in cell nuclei). Several different nitrogenous bases have been isolated so that a number of different nucleotides are possible. A repeating regular pattern of nucleotides is linked by the phosphate groups forming nucleic acids. The functions of nucleic acids are of fundamental importance. They are concerned in the process of transmission of inherited qualities in reproduction and in building up body proteins. Lord Todd of Cambridge University was awarded the 1957 Nobel Prize in Chemistry for his work on the structures of nucleic acids. The 1962 Nobel Prize in Medicine (see L128) was awarded for the discovery of the molecular structure of D.N.A. See F28(2) 29.

Nuremberg Trial. On Nov 21 1945 an International Military Tribunal consisting of

one American one British one Russian and one French member began the trial of twenty four Nazi leaders. There were four counts: the conspiracy of Nazism, wars of aggression, war crimes, and crimes against humanity. Twelve were condemned to hanging of whom ten were hanged on Oct 16 1946. Goering committed suicide. Bormann has never been found. Papen Schacht and Tieschke were acquitted. The rest received varying terms of imprisonment.

Nuthatch name of a number of tree creeping birds plump with short all bluish grey plumage and black stripe under eye. Nest in holes and wedge nuts in bark of trees hammering them to get a kernel. There are three European species: one *Sitta europaea* resident in England.

Nylon a generic term for any long chain synthetic polymeric amide which has recurring amide groups as an integral part of the main polymer chain, and which is capable of being formed into a filament in which the structural elements are orientated in the direction of the axis. The first nylon of commercial interest was made in 1935 and the world's first nylon factory—in the United States—began production in 1940.

O

Oak a tree of the genus *Quercus* including some 300 species distributed over the northern hemisphere and into the tropics. Two species are native to Britain where the oak is the commonest tree (1 in 3)—*Q. petraea* more common in the wet and north on shallower lighter soils and *Q. robur* more common in the south on deeper heavier soils. Oak timber is much prized for its strength and durability and from the time of the Spanish Armada to Nelson's day was in great demand for naval construction. It has always been used for building flooring furniture and cabinet work. The oak is attacked by many insects the round nut like oak gall, or oak apples being produced by the sting of certain minute gall wasps.

"Oaks" a famous race for three year old fillies run at Epsom two days after the Derby.

Obelisk a tapering monolithic column square at the base and pyramidal at the top regarded by the ancient Egyptians as a sacred stone and usually found at the entrance to the sun temples. Many were transported from Egypt and set up at various times: there is one in the Place de la Concorde in Paris and one on the Thames Embankment in London—Cleopatra's Needle—originally erected at Heliopolis centre of the sun cult by Thutmose III c 1500 B.C.

Observatories existed in ancient Babylon and Egypt. They were erected on mounds and temples. The most famous observatory of Egypt was that of Alexandria erected by Ptolemy Soter 300 B.C. It was not until the 16th cent. however that an observatory adequately equipped for astronomical investigations was built. This was at Cassel Tycho Brahe's observatory at Uraniburg was erected in 1576. The Royal Observatory at Greenwich was completed in 1675. Mount Wilson Observatory in California has had a 100 in. reflector telescope working since 1917 but Mount Palomar Observatory also in California has a 200 in. reflector—the largest in the world completed in 1949—which can reveal remote galaxies out to a limiting distance of 2,000 million light years. It is known as the *Hale* telescope in memory of Dr. George Ellery Hale the founder of the Mount Wilson Observatory. The 98 in. telescope the *Isaac Newton* for the Royal Greenwich Observatory at Herstmonceux Castle was completed in 1987. A number of observatories are devoted to meteorological and geophysical work: the most important in the British Isles being those at Eskdalemuir (Dumfriesshire) Kew (Lewisham) and Valencia (Balearic Islands). See also *Astronomy and Telescopes*.

Ocean's Razor See J37.

Occultation, in astronomy, refers to the concealment of a celestial body by the passing before it of some other heavenly body. The most frequent occultation is the eclipse of a star or planet by the moon.

Ocean, comprises the great body of water which

covers five-eighths of the surface of the earth and has an average depth of 2 miles. The principal oceans are the Pacific Atlantic Indian and Arctic. See F8(2).

Ocean Currents are well defined streams running over certain portions of the ocean and caused mainly by wind friction slope of the sea surface and differences in density of the water. All movements being influenced by the deflective forces due to the earth's rotation. The climatic importance of the great ocean currents is that they constitute one of the means whereby heat is transferred from lower to higher latitudes.

Ocelot the most common wild cat of S. America. It is about 4 ft. in length including tail and of a grey or tawny colour and spotted. Closely related to the Leopard cats.

Octane Number the index of the knocking of petrol. It is based on the arbitrary scale in which iso octane (which does not cause knocking) has a value of 100 and normal heptane (which is prone to knocking) has a value of 0. A good fuel for modern cars must have an octane number greater than 80.

Octarchy the kings of the English heptarchy. Henry 1st (456) being the first and Edgar (800) the last.

October the 10th month but the 8th in the old Roman calendar. It was held sacred to Mars.

Octopus a genus of marine molluscs with eight tentacles that bear suckers.

Odyssey Homer's epic setting forth the incidents of the wanderings of Odysseus on his way back to Ithaca after the Siege of Troy. See E13.

Oeil de boeuf meaning bull's eye is the name of a small octagonal vestibule lighted by a small round window in the palace of Versailles. The term is used in architecture for a small round or oval window in freizes roofs or domes of buildings.

Oersted a unit of magnetic field intensity in the c.g.s. system.

Ohm's Law propounded by G. S. Ohm in 1826 is expressed in the equation: electromotive force (in volts) = current (in amperes) \times resistance (in ohms). The ohm is the unit of electrical resistance in the metre kilogram second system.

Oil The great expansion in energy demand over recent years has been met to a large extent by petroleum oil. This contains a wide range of hydrocarbon molecules of varying complexity. The various components are separated from each other by making use of their different boiling points. Crude oil is heated in the base of a fractionating tower the various components condense at different temperatures in trays at different levels of the tower. The fraction of a given composition can be increased by cracking or breaking down the heavier hydrocarbons into lighter ones. The total world reserves of petroleum oil are still uncertain since large parts of the world are still not fully prospected. However such information as exists suggests that total reserves from all sources may be between 5×10^{11} and 10^{12} tons of oil.

Okapi, nocturnal ruminant mammal smaller than the giraffe chestnut brown in colour with zebra striped legs native to the African Congo.

Olbers' Comet was discovered in 1815 by Olbers the German astronomer. Olbers also discovered the asteroids Pallas and Vesta (1802-07).

Old Red Sandstone, the continental rocks formed during the Devonian. See F44.

Olefines a series of hydrocarbons in which the hydrogen atoms are double the number of carbon. The first member of the series is ethylene.

Oleic Acid, an important fatty acid present in lard and olive- and cotton seed oils. Used in soap making. Olefin is the ester formed by the reaction of oleic acid and glycerine.

Oleron Laws or Judgments, were a code of maritime laws, introduced into England in the reign of Richard I. in the 12th cent. Oleron is an island off the west coast of France opposite the mouth of the Charente.

Olive This small tree, whose fruit yields olive oil is a native of the eastern Mediterranean countries but has been introduced into cultivation elsewhere. Its oil is used for cooking in packing sardines and in soap making. The green unripe fruit is pickled for table olives.

Olympiads were periods of four years which elapsed between each celebration of the Olympic

games held at Olympia in honour of Zeus. These festivals included competitions in literature, art, drama, rhetoric, music and gymnastics and they were continued with intervals from 776 B.C. to A.D. 394. Athletic revivals have taken place at Athens 1896, Paris 1900, St. Louis 1904, London 1908, Stockholm 1912, Antwerp 1920, Paris 1924, Amsterdam 1928, Los Angeles 1932, Berlin 1936, London 1948, Helsinki 1952, Melbourne 1956, Rome 1960, Tokyo 1964, Mexico City 1968 and it is planned to hold the 1972 Olympic Games at Munich. See U33 36.

Onomasiastics is a branch of linguistics which studies the fascinating subject of names—names of places and names of people—to find out their origin. They tell us, for example, that Cambridge is an Anglo-Norman corruption of *Grantabrycg* = bridge over the Granta, that Harrow on the Hill was an early Anglo-Saxon settlement—the *hæthen temple on the hill*—that we owe the ridings of Yorkshire to the Vikings (Old Norse *þrúðungar* = third part) that in Scotland *for* and *to* indicate not a town but a hamlet or village. Onomasiastics are also concerned with the international standardisation of place names.

Onyx or **Sardonyx** a variety of chalcedony built up of different coloured layers which are parallel and straight (not curved as in agate). **Oolite** a geological term for the Jurassic oolitic limestone—existing through a long stretch of country extending from Yorkshire to Dorset-shire. It abounds in fossils of molluscs and reptiles. The term oolite derives from the fact that these rocks are made of egg-shaped particles of calcium carbonate.

Opal a mineral consisting of hydrous silica, occurring in numerous varieties and colours. Precious opal displays a beautiful internal opalescence the result of the interference of light waves on the surfaces of layers, differing in their water content. Opal miners are called *gougiers*. Chief source the Andamooka and Coober Pedy fields of South Australia.

Opera See Section E

Opium was known to the ancients and used by them as a medicine. It is obtained from the poppy (*Papaver somniferum*) the unripe head or seed capsule of that flower yielding a juice which when dried becomes the opium of commerce. The poppy is cultivated in India, Persia, Turkey, Macedonia and China for the sake of this juice which yields various alkaloids, such as morphine, narcotine, codeine etc. These days the drug is rarely used medicinally. See also P22(2).

Opposum marsupial mammals found in the more southerly of the United States, South America and Australasia. They are arboreal except for the water opossum which eats fish.

Optics the branch of physics which investigates the nature and properties of light and the phenomena of colour. Burning lenses were known to the ancient Greeks and Ptolemy wrote a treatise on optics A.D. 150. Lenses as visual aids were known in ancient China but eyeglasses were not in use until the 13th cent. Spectacles were in more general use after the invention of printing in the 15th cent. The camera obscura was invented in the 16th cent. and the telescope and microscope at the beginning of the 17th cent.

Oracles were in ancient times supposed to be words spoken by the gods and it was the custom on important occasions to consult them about the future. The Greeks had the Oracles of Zeus at Dodona and Apollo at Delphi while the Romans consulted the Oracles of Mars, Fortune and others.

Orange a fruit growing in most subtropical climates and in universal demand. It is grown on an evergreen tree that attains a height of about 20 ft. at maturity.

Orang utan one of the largest of the anthropoid apes found only in the swampy forests of Borneo and Sumatra. When full grown it stands over 4 ft. in height and weighs about 150 lb.

Orchestra, a group of instruments and instrumentalists whose playing is under the direction of a conductor. The composition of a typical symphony orchestra is as follows: **Strings** 1st Violin (16) 2nd Violin (16) Viola (12)

Violoncello (12) Double Bass (8) **WOOD WIND** Flute (3-4) Piccolo (1) Oboe (3) Cor Anglais (1) Bass Oboe (1) Clarinet (4) Bass Clarinet (1) Bassoon (3) Contra bassoon (1) **BRASS** Horn (6) Trumpet (5) Trombone (3-4) Tuba (2) **PERCUSSION** Timpani (3-8) Side Drum (1) Bass Drum (1) Cymbals (1) Harp (2).

Orders in Council are issued by the sovereign on the advice of a few selected members of the Privy Council. They must not seriously alter the law of the land. Another class of Orders in Council are issued by authority of an Act of Parliament for the carrying out of its provisions. Ordination, the ceremony of installing ministers or clergymen in clerical offices, has existed from the earliest times. In the Anglican and Roman Catholic Churches the rites of Ordination are performed by bishops, among Nonconformists the power of ordination rests with the governing bodies of the different Churches.

Organ is a musical wind instrument of ancient origin whose tones are produced by the vibrations of air in pipes of varying length. Basically an organ consists of a number of pipes grouped in rows or ranks according to their special tone character. The air is fed by bellows or in modern organs by a rotary fan, electrically driven. Each rank is controlled by a slider and the knob that controls the slider is called a stop. The organist pulls out the stops to give the tones he wants; the other pipes being kept out of action by the slider. When a particular note on the keyboard is depressed the player may hear by pulling out the appropriate stop not only the normal pitch but the note in several octaves. A top of which the notes are of normal pitch is called an 8 foot stop, a 16 foot stop would give an octave lower, a 4 foot stop an octave higher and a 2 foot stop two octaves higher. The hand keyboard is called a manual and the foot keyboard the pedal board. The basic tone of an organ is its diapason tone and is normally of 8 foot length and pitch. Most large organs have four manual keyboards and one pedal board. The most important manual is the great organ which comprises the majority of basic stops. The next in importance is the swell organ so called because the pipes are enclosed in a box fitted with movable shutters operated by a swell pedal. The effect provides a controlled crescendo or diminuendo. The tone of a typical English swell has a reedy character. The third manual controls the choir organ—a collection of stops suitable for vocal accompaniment. The fourth manual controls the solo organ—a group of stops which singly or in combination may provide a solo melody while the remainder of the organ accompanies. The pedal keyboard controls most of the bass stops. In some very large organs there is a fifth manual controlling the echo organ. This is a small group of stops usually set high in the roof of the building to give the effect of distant music. Most church organs have two or three manuals. Modern cinema organs may have some normal stops but rely chiefly on a number of effects unknown to the straight organ.

Organic Chemistry The chemistry of compounds containing carbon and usually associated with living organisms. See F24-5.

Oriel Window is a window projected from the front of a building rectangular, triangular or polygonal. The ordinary bay window and bow window are varieties of Oriel. When an Oriel window does not reach to the ground it usually rests upon moulded sills supported by corbels.

Oriflamme the name of the original banner of the abbey of St. Denis and adopted by Louis VI as his standard. It remained the national emblem of France for three centuries. The flag was of red silk, the outer edge being cut in the form of flames.

Original Sin, according to Christian doctrine the corruption that is born with us as a result of Adam's fall.

Orois brilliantly coloured birds, members of the passerine family *Oriolidae* found in the tropical regions of Asia, Africa and Australia. The golden oriole, perhaps the most beautiful of them all with brilliant yellow plumage, black wings and tail, winters in Africa, visits England and is known to have nested here.

Orion a famous constellation of the heavens comprising nearly a hundred stars all visible to the naked eye. It contains three stars of the second magnitude in a line and these are called Orion's Belt.

Omer a shellfish (*Halotis tuberculata*) which occurs in the Channel Islands and on parts of the French coast. It is considered a great delicacy.

Ornithology, the scientific study of birds.

Ornithorhynchus See Duckbill.

Orogeny, large scale earth movements including faulting and folding and sometimes igneous activity which produces a linear belt of mountains e.g. the Alpine orogeny in Europe which produced the Alps.

Orphism See J83 H117-123.

Orphrey the name of an ornamental border of gold and silver embroidered on ecclesiastical vestments.

Orrery an instrument used in the 18th and early 19th cent which showed the motions of the planets round the sun and the satellites round their primaries. The first orrery made was named after Charles Boyle, Earl of Orrery.

Orthodox Eastern Church See J37.

Osborne House, near Cowes in the Isle of Wight. Queen Victoria's favourite winter residence and where she died. It was given to the nation by Edward VII. and is now a convalescent home.

Osier a species of willow growing in damp soils and yielding branches utilised in basket making.

Osmium, a very hard, bluish white metal, symbol Os of the platinum group and one of the heaviest of known metals. It is obtained from certain sands of South America, California, Australia, and Russia. The alloy of osmium and iridium (osmridium) provides long wearing tips for gold fountain pen nibs.

Osmosis The process by which absorption of liquids through semi permeable membranes takes place. A solution exerts osmotic pressure (O.P.) or suction in proportion to concentration but also depending on kind of dissolved substance. The roots of the higher plants are covered with fine root hairs within the cell walls of which the sap is normally of a higher concentration than the dissolved matter in the surrounding soil. The root hairs, therefore, draw into themselves these weaker salt solutions. (The explanation of water and salt exchanges is complicated by the selective ability of some cells (e.g. roots) to accept or reject particular dissolved substances along with the water. The absorption of salts by a plant is selective each plant selecting through the semi permeable membranes of its root hairs those substances which are most suited to itself.)

Osprey (*Pandion haliaetus*) a large and magnificent bird of prey, dark brown above and nearly white below. The head is whitish with a dark band from eye to nape. To the British Isles it is a rare passage migrant. In 1950 thanks to the energy and vigilance of the Royal Society for the Protection of Birds a pair nested in a Scots pine in Inverness shire and reared three young. Since then more young ospreys have been safely fledged in this sanctuary. The food consists almost entirely of fish which the bird seizes with its talons. The so called osprey plumes do not come from this bird but from the egret.

Ostrich the largest living bird related to the rheinemu and extinct moa now found only on the sandy plains of Africa and parts of S.W. Asia. The male has beautiful white plumes on wings and tail. The wings are useless in flight but the birds have a fleetness of foot exceeding that of the swiftest horse. An ostrich's egg weighs 3 lb.

Otary any seal which has external ears (as opposed to the *true seals* which lack them). The eared seals make up the family *Otariidae* which includes the Sea-Lion and the Fur seal of the N. Pacific.

Other an aquatic carnivorous mammal widely distributed over Europe, and at one time very common in England and Wales. The other averages about 2 ft in length exclusive of tail has web-feet, and is a very expert swimmer. Others are harmless and their hunting is a cruel and senseless blood sport.

Onocot, a carnivorous member of the cat family spotted like a leopard and having a long bushy

tail. It is only found at high altitudes on the Himalayas and is often called the snow leopard.

Outcrop Where a bed of rock appears at the surface of the ground there is an outcrop of the particular rock. Outcrop coal is surface coal, the thinning of such coal is called open cast mining.

Oviparous a zoological term referring to animals which lay eggs to be hatched outside the body of the parent.

Ovipositor the organ by means of which female insects lay their eggs.

Owls nocturnal birds of prey distributed over the greater part of the world. Their forward looking eyes embedded in rings of feathers give them a characteristic owl like appearance and their plumage usually a mottled blend of browns and greys is so soft that their flight is almost noiseless. Owls live on small mammals, reptiles, birds, insects and fish and are very valuable birds to the farmer. British owls include the barn owl (screech owl), short eared owl, long eared owl, tawny owl, little owl. Snowy owls have recently nested in the Shetland Is.

Ox, the popular name of the mammals included in the genus *Bos*. They are hollow horned ruminants and hoofed quadrupeds and include the various classes of domestic cattle as well as the different wild species. The adult male is called a bull, the female a cow and the young a calf. The best-known breeds of domesticated cattle are the Durham or Shorthorn, the Angus, the Jersey, Ayrshire, Suffolk, and Hereford.

Oxalic Acid an organic acid obtained from numerous plants such as sorrel and rhubarb and produced artificially for commercial purposes from sawdust treated with caustic potash or caustic soda. It combines with metals to form oxalates.

used in the manufacture of ink.

Oxford clay a geological formation consisting of a bed of blue clay hundreds of feet thick and forming the lower portion of the Upper Jurassic. It makes good bricks.

Oxford University The early history of the university is obscure. There was a school at Oxford as early as 1115 and it is known that Robert Pullen, a theologian from Paris, lectured there in 1133. Allusions to Oxford as the most celebrated centre of learning in England occurred in a work of Gerald of Wales in 1184-5. The earliest colleges to be founded were University College (1249), Balliol (about 1263), Merton (1284). In 1571 the university was reorganised and granted a Charter of Incorporation by an Act of Elizabeth. Other colleges and halls with their dates of foundation are: All Souls (1438), Brasenose (1509), Christ Church (1546), Corpus Christi (1517), Exeter (1814), Hertford (1874), Jesus (1571), Keble (1838), Lincoln (1862), Lincoln (1427), Magdalen (1458), New College (1879), Nuffield (1937), Oriel (1526), Pembroke (1624), Queens (1840), St Antony's (1950), St Catherine's (1962), St Cross (1966), St Edmund Hall (1270), St John's (1555), St Peter's (1829), Trinity (1564), Wadham (1812), Wolfson (1965), Worcester (1714), Campion Hall (1962), St Benet's Hall (1964), Mansfield (1886), Regent's Park (1958), Greyfriars Hall (1953). The women's colleges are—Lady Margaret Hall (1878), Somerville (1879), St Hugh's (1886), St Hilda's (1893), St Anne's (1952). Women were not admitted to degrees (though allowed to sit for examination) till 1920.

Oxygen is the most abundant of all terrestrial elements, symbol O. In combination, this gaseous element forms about 46% of the earth's crust, one-fifth of the atmosphere, eight-ninths by weight of all water. Discovered independently by Scheele (c. 1773) and Priestley (1774). It is colourless, tasteless and odourless and forms the chief life supporting element of animal and vegetable life.

Oyster a bivalve mollusc of the genus *Ostrea* having very numerous species and abounding in nearly all seas. The shell is rough and irregular. Oysters are exceedingly prolific spawning in May and June in England and Scotland deep-sea oysters are not allowed to be sold between June 15 and Aug. 4 and other kinds between May 14 and Aug. 4. In Ireland no oysters may be taken between May 1 and Sept. 1 except in certain waters. The White-

stable oyster beds have existed since pre Roman times. Clocks are dead oysters.
Oystercatcher a wading bird with black and white plumage and long orange bill inhabiting estuaries and sea shores. Feeds on mussels shell fish etc but not oysters.
Ozone a modified form of oxygen containing three atoms of oxygen per molecule instead of two. It is prepared by passing oxygen through a silent electric discharge. When present in air to the extent of 1 part in 4 million parts of air it kills bacteria and has been used for this purpose in ventilating systems *e.g.* that of underground railways. It is present in extremely small quantities in the lower atmosphere but is comparatively plentiful at heights of about 20 miles. The belief widely held that ozone is particularly rich in ozone is untrue. As ozone absorbs ultra violet light of certain wavelengths spectroscopic methods involving the analysis of sunlight are chiefly used in ozone determinations. See also Atmosphere.

P

Paca a genus of large rodents found in Central and South America and resembling the guinea pig. It is of nocturnal habit, has a streaked and spotted fur and lives on fruits and plants.
Pacific Ocean. The first European to recognize the Pacific as distinct from the Atlantic was the Spanish explorer Vasco Nuñez de Balboa who discovered its eastern shore from a peak in Panama in 1513. The first European to sail upon it was Magellan who entered it by the strait that bears his name in 1520. Sir Francis Drake was the first Englishman to sail upon it in 1577. The world's greatest ocean depth (6297 fathoms or just over 7 miles) was established by a British survey ship in 1902 in the Mindanao trench in the Philippine Sea.
Pagan a person who does not worship God, a heathen. The word is derived from the Latin *paganus* (a countryman or uncultivated person). In the Middle Ages the term was used largely to describe Mohammedans (Moors Saracens etc).
Pagoda the name given in China, India, and other Asiatic countries to a high pyramidal tower usually but not necessarily connected with a temple.
Palaeontology the science which is devoted to the investigation of fossils (animal palaeozoology) and plants (palaeobotany). By studying the markings and fossils of living things in the stratified rocks palaeontologists have been able to establish with astonishing accuracy a record of the evolution of life through geological time. The geologist at the same time with the evidence of the fossils has been able to work out the order and the age of the rocks. See also F44.
Palatinate, a term formerly applied to two German electorates or provinces, the Upper and Lower Palatinates. They are now provinces of Bavaria.
Pale, the name given to the part of Ireland colonised by the English and comprising portions of the counties of Louth, Dublin, Meath, and Kildare. The Anglo-Saxon rulers were styled Lords of the Pale.
Palimpsests are ancient MSS or parchments which have been partly effaced and used for fresh writings. Many valuable MSS were thus lost but sometimes the second writing has been washed out enabling the original writings to be deciphered. Among such restorations are the dialogue of Cicero; a portion of a book of Livy etc.
Palladium a scarce metallic element symbol Pd similar to platinum with which it is usually found. It is an expensive metal with desirable properties as a catalyst in reaction involving hydrogen since it has a remarkable capacity for absorbing this gas for example coal gas and air will inflame in the presence of palladium at room temperature. It forms silver white alloy with gold and this is used in some kinds of jewellery. It is used in expensive watches to make non magnetic springs.
Pallium, a vestmental ornamentation of white wool presented by the Pope to archbishops on their appointment and the sign of Papal confirmation.
Palm, a large straight trunked plant or tree

common to tropical countries and usually fruit yielding such as dates coconuts etc. Many commodities useful to man are obtained from plants of the Palm family (*Palmaeae*).
Palm Sunday the Sunday before Easter upon which occasion it is customary to carry palms to the churches in some countries in commemoration of Christ's entry into Jerusalem 'till the Feast of the Passover when the people went forth to greet Him with palm branches.
Panama Canal In 1903 the United States signed a treaty with Panama (which had previously seceded from Colombia) which gave the United States rights in perpetuity over a ten mile wide strip of land extending across the isthmus for the purpose of building and running the canal. The canal connects the Atlantic and Pacific Oceans is just over fifty miles long (with its approaches) and the depth varies from 41 to 85 ft. It is constructed above sea level with locks and has been available for commercial shipping since Aug 3 1914. Studies are in progress for the building of a new sea level canal to replace the present one.
Panda, or Cat-Bear is related to the Paccoon Dogs and the Bear. There are two kinds the Red or True Panda resembling a large domestic cat which lives in the eastern Himalayas and S.W. China and the Giant Panda which is more like a bear in appearance and inhabits the mountains of western China. Both frequent the dense bamboo forests of these regions.
Pangolin the scientific name of the scaly anteater a toothless mammal found in W. Africa and S.E. Asia. It has a long extensible tongue which it uses in catching ants and termites its chief food. When attacked the pangolin rolls itself into a ball and its scales assume the form of sharp spikes. Pangolins have an Order of their own—the Pholidota the scale bearers.
Pantagruel the leading character in one of the satires of Rabelais.
Pantheon the famous temple in Rome originally consecrated to the gods built by Agrippa in 27 B.C. and rebuilt in the 2nd cent. by Hadrian. Its splendid dome and portico make it one of the most interesting architectural monuments of ancient days. Since the 7th cent. it has been used as a Christian church.
Panther another name for the leopard *Panthera pardus* related to the lion carnivorous active clamber found in India and other parts of Asia also in Africa.
Papal Infallibility See J38.
Paper has been known in one form or another from very early times. The papyrus reeds of the Nile swamps served the ancient Egyptians for sheets upon which to inscribe their records. The Chinese and Japanese centuries later were using something more akin to modern paper in substance an Asiatic paper mulberry yielding a smooth fibrous material being utilized. With the spread of learning in Western Europe the necessity of a reader medium made itself felt and paper began to be manufactured from pulped rags and other substances. The first known English paper mill was Sele mill near Stevenage built about 1490 which produced the paper for an edition of Chaucer in 1498. Other mills were set up under Elizabeth, using linen and cotton as raw material. Other papermaking staples were later introduced such as surati esparto grass and wood pulp. The chief raw material in the world paper industry is wood pulp the main exporters being the timber growing countries of Canada Sweden and Finland. Canada is the world's chief producer of newsprint and supplies a large proportion of U.S. requirements.
Paper mâché means pulped paper and is a composition of paper pulp and other substances, to which when moulded into form coatings of Japan, with gilt and coloured malays are added. Elegant and decorative objects are made of paper mâché. A ceramic paper mâché is very durable.
Papyrus, the earliest known paper made in Egypt at a very remote period from a large species of reed *Cyperus papyrus*. This plant is to be found all over tropical Africa, especially in the Nile region of the White Nile.
Parachute the umbrella-shaped safety device used in emergency by the crew and passengers of

aircraft The first parachute descent from a great height was made in 1797 by André Garnerin who dropped 3 000 ft from a balloon See also Parachute Jumping U21

Paraclete (the Holy Ghost or Comforter) the name used in the English translations of St John's Gospel and adopted by Abelard to designate the convent in Champagne founded by him and of which Héloïse became the abbess

Paradise a Persian word used by the translators of the Old Testament to designate the Garden of Eden and since meaning any place of happiness

Paraffin a mixture of hydrocarbons of higher boiling point than petrol Paraffin was first obtained by distillation of coal the process being discovered about 1890 About 1848 Mr James Young procured it from mineral oil, and Irish peat also yielded it The main source of paraffin supply to-day is crude petroleum It is largely used in the manufacture of candles for waterproofing and numerous other purposes

Parakeets various small parrots of vivid plumage native to Australia Polynesia Asia and Africa One of the loveliest of the parakeets is the budgerigar of Australia See Z21 23

Parallax the change in direction of a body caused by a change in position of the observer If the parallax is measured (in degrees of angle) and the distance between the two observation points is known the distance of the observed body can be calculated The distance of heavenly bodies has been found this way The first stellar distances were so obtained in 1838 by Henderson Struve and Bessel Stellar distances are so great that even when the two observations are made at opposite points of the earth's orbit round the sun the parallax is always less than 1.0 of arc See Aberration

Parchment made chiefly from the skins of animals usually of goats and sheep was employed in olden times before printing was invented and superseded papyrus as writing material Vegetable parchment invented by W E Game in 1853 though not equal in strength and durability to skin parchment is about five times stronger than ordinary paper Vellum is parchment made from the skins of young calves or lambs

Paris University of which the Sorbonne forms a part was founded in the 12th cent and is one of the greatest educational institutions of Europe

Parliament is the name given to the supreme legislature of the United Kingdom It consists of the Queen, the Lords spiritual and temporal, and the Commons It meets in two houses the House of Lords (the Upper or Second Chamber) and the House of Commons It derives from the Anglo-Saxon *Witan* (see Witan) The Statute of Westminster (1275) first uses parliament of the Great Council in England, which comes from the French word meaning discourse See Central Government, Section C also D8

Parliamentary Correspondents sit in the Press Gallery of the House of Commons and describe its proceedings for newspapers either by impressions or a summary of the debate

Parquetry the name of a style of flooring consisting of small rectangular wooden blocks laid down according to geometrical pattern

Parrot the popular name of a widely distributed family of tropical birds, including the African grey parrot, the green parrot of South America—both familiar cage pets in this country—and the various parakeets, cockatoos macaws lorises etc Many of these birds possess a remarkable gift of imitating sound especially that of the human voice

Parsec unit of distance used by astronomers for expressing distances between stars equivalent to about three and a quarter light years

Parthenogenesis The development of animals from unfertilised eggs The drones of the honey bee are parthenogenetic and the phenomenon is also common among aphids

Parthenon, the famous Temple of Athens on the Acropolis at Athens was built under the rule of Pericles between 447 B.C and 433 B.C It was made wholly of marble without mortar The famous sculptured friezes known as the Elgin Marbles are now in the British Museum

Partridge a well known British game bird Close time Feb 2 to Aug 31 Two species are common in Britain

Passeriformes the order of perching birds which includes about half the known species

Passport is an official document issued to a person by his own government certifying to his citizenship and permitting him to travel abroad Passports to British subjects are granted by the Foreign Office authorise bearer to leave the country and guarantee him the state's protection Passports now cost £2—and are issued for a period of 10 years Passports for children under 16 are issued for 5 years in the first instance renewable then for a further 5 years with out fee on production of new photographs etc A simplified form of travel document (British visitor's passport) is issued for British subjects wishing to pay short visits to certain foreign countries for a fee of 7s 6d valid for 12 months

Patricians the aristocracy of ancient Rome

Paul's Cathedral, St is the third cathedral church to be built on the site It was preceded by a Norman building which was practically destroyed by the Great Fire in 1666 This followed a Saxon church which was burnt in 1086 The present building was designed by Sir Christopher Wren The foundation stone was laid in 1676 and the structure was completed in 1710 It cost a little under £748 000 Its central feature is the dome crowned by its cupola and lantern with the golden ball and cross It escaped serious damage during the air raids of the second world war but many of the surrounding buildings were laid waste

pC Value, introduced by Dr C L Whittles in 1935 as a measure of salinity of aqueous solutions (soil extract irrigation water etc) defined as the negative logarithm of specific electrical conductivity in reciprocal ohms Alone or joined with pH (below) is useful as an index of osmotic pressure (see Osmosis) and related hindrance to plant growth resulting from excess of fertiliser or soil salts If manuring is balanced growth is best about pC 8.8

Peacock a bird of large size and beautiful plumage its characteristic feature being a tail of brilliant eyed feathers which it can erect and spread out the males possessing resplendent feathering to a much greater extent than the females It is related to the pheasant one species is found wild in the forests of India and another in habits Burma and the Malayan regions, in Africa there is the Congo Peacock

Pea a term in heraldry indicating one of the furs borne in coat armour the ground of which is black, with ermine spots of gold

Peanut Ground Nut or Monkey Nut A member of the pea family native to S America but now cultivated in many parts of the world After pollination the flower stalk bends down and buries the pod containing the peas (nuts) in the ground The oil from these nuts can be used for margarine manufacture

Pearl is produced by certain shelled molluscs chiefly the oyster The inner surface of the shells of the pearl oyster yield mother of pearl and distinct pearls are believed to be morbid secretions caused by some external irritation Many fine pearls are found in the actual body of the oyster The Persian Gulf Ceylon the north west coast of Western Australia many Pacific islands and the Gulf of Mexico are among the most productive pearl fishing grounds In ancient times Britain was renowned for its pearl fisheries the pearls being obtained from a species of fresh water mussel Western Australia has produced a 40 grain pearl the finest the world has seen The largest pearl ever found was the Beresford Hope Pearl, which weighed 1 800 grains over six times as much as the oyster that produced it

Peat decayed vegetable matter found mostly in marshy positions and common in Ireland and Scotland Peat is coal in its first stage of development burnt for fuel in many cottage homes

Peccary a pig like animal native to the Americas There are two species the collared peccary and the white lipped peccary the latter being a vicious and dangerous animal

Pelican, a genus of bird with long depressed bill pouched underneath thus able to hold fish in

- reserve. It has immense wings and webbed feet. Eight species.
- Pemmican**, venison or other meat sliced, dried, pounded and made into cakes, used by explorers and others when out of reach of fresh meat.
- Penguin**, a genus of flightless fish-eating sea birds of the southern hemisphere. They are stout bodied, short necked and of small, moderate or large size. The Emperor and King Penguins make no nest but protect and incubate the single egg by carrying it in the down feathers between the feet and the body. Other species brood in the usual way and may lay as many as three eggs. Penguins use their flippers for swimming under water. All 17 species are bluish grey or blackish above and white below. They are very sociable and breed in colonies.
- Penicillin**, An antibiotic drug produced by the mould *Penicillium notatum* and discovered by Sir Alexander Fleming in 1928. It is one of the most effective chemotherapeutic agents known. The mould produces a number of penicillins all of which are effective antibiotics. See P4(2) (91).
- Peninsular War** lasted from 1808 to 1814. Fought in Spain and Portugal (the Iberian peninsula) by the British Spanish and Portuguese forces, chiefly under Wellington against the French. The latter were defeated.
- Penitentiary**, government office in Washington (the largest in the world) housing many thousands of military and civilian workers in the War Department of the United States (Army Navy and Air Force).
- Pentateuch**, the first five books of the Old Testament—Genesis Exodus Leviticus Numbers and Deuteronomy. Referred to in the Gospel of Mark as the book of Moses.
- Pepys Diary** by Samuel Pepys was first published in 1825. It gives a picture of the social life of the period 1 Jan 1660 to 31 May 1669. He bequeathed the manuscript together with his library to Magdalene College Cambridge.
- Perch**, a well known family of fresh water fish with dark striped sides. The common perch of British rivers and lakes falls an easy prey to the angler because of its voracity.
- Perfumes** are essences or odours obtained from floral and other substances. The chief flower perfumes are those obtained from rose, jasmine, orange flower, violet and acacia. Heliotrope perfume is largely obtained from vanilla and almonds. Among the aromatic herbs which yield attractive perfumes are the rosemary, thyme, geranium, lavender etc. while orange peel, citron, peal, musk, sandalwood, patchouli and other vegetable products are largely drawn upon. In recent times chemistry has been called into play in aid of the perfumer and many of the popular perfumes of to day are chemically prepared in simulation of the scents of the flowers or other natural substances the names of which they bear. See Musk Deer.
- Pericalse** a mineral form of magnesium oxide.
- Perigee**, The moon or the sun is said to be in perigee when it is at its least distance from the earth. The opposite of apogee (*q.v.*).
- Perihelion**, That point in a planet's orbit when it is nearest to the sun. The opposite of aphelion.
- Peripatus** an animal which stands as a link between the annelid worms and the arthropods. Wormlike with short unjointed legs it breathes by a system of air tubes like those in insects. Certain other points of internal structure point to a relationship with annelid worms. There are some fifty species, the best known being the S. African *Peripatus capensis*.
- Perjury** the offence of giving false evidence. The ancient Romans threw the perjurer from the Tarpeian Rock and after the Empire was Christianised, those who swore falsely upon the Gospel had their tongues cut out. The usual punishment in England from the 16th to the 19th cent was the pillory, fine and imprisonment.
- Permian Formation**, a group of rocks lying between the Trias and the Carboniferous strata. It has three subdivisions, Upper Middle and Lower Permian. See F44.
- Per Procuratorem** signature means that the subject of the correspondence has been put into the writer's care by his principal for him to use his personal judgment in the matter and that he is authorised to sign on behalf of his principal. Normally contracted to *per pro* or *p p*.
- Petuke** the name given to the wigs worn by men in the latter half of the 18th cent. The custom of wearing wigs was gradually superseded by powdering the natural hair. Wigs are still worn by the Speaker of the House of Commons, judges and barristers.
- Petrel** the name given to a member of a large widely distributed family of sea birds of great diversity of size and colouring and distinguished by tube like external nostrils. They usually skim low over the waves and some for this reason are known as shearwaters. The storm petrel or Mother Carey's chicken occasionally patterns along the surface and is often called Little Peter—a reference to St Peter walking on the water. Except when breeding petrels are always at sea. They mostly nest in holes and crevices on islands and lay one egg which is invariably white. The storm petrel Leach's petrel Manx shearwater and the fulmar petrel are resident in the British Isles. See also Mutton Bird.
- Petroleum**. See Oil.
- Pewter** alloy of tin and lead formerly used for making household utensils and ornaments.
- pH Value** Introduced in 1909 by the Danish chemist Sørensen to indicate hydrogen ion concentration on the basis of electrical conductivity and a view of ionisation since discarded, is now taken as a logarithmic scale of acidity or alkalinity of aqueous solutions. acidity 0-7 neutrality \approx 7.0 alkalinity 7-14. The pH of blood is about 7.6 (fairly alkaline). See F22.
- Phalanger** pouched marsupial mammals. They are arboreal and superficially resemble squirrels. There are two genera of flying phalangers or flying squirrels, which have a remarkable membrane along each side of the body enabling the animals to glide through the air. The members of the phalanger family are confined to the Australasian and oriental regions.
- Phalangid** a member of the arachnid family.
- Phalangia** popularly known as 'harvesters'.
- Phalanx**, a name applied by the ancient Greeks to a body of troops drawn up in close array with overlapping shields and eight ten or more rows deep. The Macedonians stood sixteen deep. A Greek phalanx consisted of 8,000 men.
- Pharisees and Sadducees**. See Judaism, 327.
- Pharmacopoeia**, an official publication containing information on the recognised drugs used in medicine. Each country has its own pharmacopoeia. The British Pharmacopoeia (B.P.) is published under the direction of the General Medical Council. The Pharmaceutical Society issues the British Pharmaceutical Codex (B.P.C.) there is also an International Pharmacopoeia (2 vols.) which is issued by the World Health Organisation.
- Pharos** the name of the first lighthouse built by Ptolemy II about 280 B.C. on the Isle of Pharos at the entrance to the harbour of Alexandria. It was 600 ft high and one of the seven wonders.
- Pheasant**, game birds related to the partridges, quails, peacocks, chickens and turkeys distinguished by their brilliant plumage and long tapering tail. First found by the Greeks in Georgia where the River Phasis flows through to the Black Sea. Close time Feb 2 to Sept 30.
- Philippics**, the orations delivered by Demosthenes, 352-341 B.C. against Philip of Macedon—remarkable for their acrimonious invective. The word was also used for Cicero's speeches against Antony. In modern use any impassioned invective.
- Philosopher's Stone**. See Alchemy, 73.
- Phosphorus** is a non metal element symbol P. Most familiar as a waxy yellow solid which is spontaneously inflammable in air. It has chemical similarities to arsenic, like which it is very poisonous. It was discovered by Brandt in urine in 1669. It is found in most animal and vegetable tissues. It is an essential element of all plants and of the bones of animals. In combination with various metals it forms different phosphates which are largely utilised as manures. The chief commercial use of phosphorus is in the preparation of matches.
- Photoelectric Cell**, a device which gives a useful electrical response to light falling on it. There are several kinds depending on the different effects which light may have on a suitably

- chosen solid (usually a semiconductor) viz the emission of electrons from the surface (photo emissive cell) change in electrical resistance (photoconducting cell) generation of electric current from a specially designed sensitive structure (barrier layer or photo voltaic cell solar battery) Different cells respond differently to lights of various wavelength and must be chosen for each application See also Solar Battery
- Photogrammetry** the science of measurement from photographs taken from an aircraft Aerial photography has many uses and is of great value to military intelligence and for map making
- Photon** When light behaves like a stream of discrete particles, and not like waves the particles are called photons See F13(1) 14
- Photosynthesis** See F28
- Phrenology** See J38
- Phylloxera**, a genus of plant lice related to the aphids which attacks the grape vine Many vineyards of France in common with the rest of Europe were replanted with native vines grafted on immune stocks from California in 1870 after being ravaged by the insect (which came from America) Curiously enough the remedy also came from America the vine stocks there being immune to *phylloxera*
- Picts** inhabitants of Scotland in pre Roman times are held by some historians to be a branch of the old Celtic race by others to have been of Scythian origin They occupied the north eastern portion of Scotland and were subdued by the Scots in Argyll in the 9th cent Kenneth Mac Alpin becoming king of a united kingdom of the Picts and Scots—the kingdom of Alban
- Pike** a familiar fresh water fish abundant in the temperate regions of both hemispheres It forms good sport for the angler in rivers and lakes and sometimes attains a weight of from 20 to 30 lb It is extremely voracious is covered with small scales and has a ferocious looking head
- Pilchard**, a fish of the herring family but with smaller scales and more rounded body It appears off the Cornish coasts in vast shoals every summer
- Pilgrimage** the undertaking of a journey to a distant place or shrine to satisfy a religious vow or secure spiritual benefit was resorted to in early Christian times The first recorded pilgrimage is that of the Empress Helena to Jerusalem in 326 In the Middle Ages pilgrimages became common and were undertaken by monarchs and people of rank in all Christian countries Moslems have been making pilgrimages to Mecca since the death of the Prophet such duty being enjoined by the Koran Among the great centres of Christian pilgrimages are Jerusalem Rome the tomb of Becket at Canterbury and the holy places of Lourdes and La Salette in France
- Pilgrim Fathers** the 101 English Puritans who after living some years in exile in Holland to escape persecution in their own country set sail for America in the *Mayflower* Sept 6 1620 landing at Plymouth Mass Dec 4 They founded the settlement of Plymouth and are regarded as the pioneers of American colonisation although 13 years earlier a small Virginian colony had been established
- "Pilgrim's Progress"** Bunyan's famous allegory written in Bedford gaol The first part was issued in 1678 It is the greatest work of its kind See M40(1)
- Pillory** a wooden instrument of punishment in use in England until 1837 It consisted of a pair of movable boards with holes through which the culprit's head and hands were put and was usually erected on a scaffold While a person was undergoing this punishment the mob generally pelted him with stones and rubbish sometimes to his serious injury People convicted of forgery perjury or libel were often condemned to the pillory but from 1816 to 1837 the only offence for which it could be inflicted was perjury
- Pine** a conifer of the genus *Pinus* which flourishes all over the northern hemisphere and includes 80-90 species which afford valuable timber and yield turpentine and tar The Scots Pine, *Pinus sylvestris* with its blue green, short needles set in pairs and its rosy orange branches is native to Britain as it is to the whole of Europe It provides the red and yellow deal in everyday use
- Pipa** a species of toad inhabiting Guiana and not found elsewhere It is of considerable size and is remarkable for the fact that the female carries its eggs on its back until they are hatched her self depositing them in that position Generally known as the Surinam toad
- Pitcairn Islanders** were originally the mutineers of the *Bounty* They took possession of the island in 1790 and it was not until 1814 that their whereabouts was ascertained accidentally by a passing ship The mutineers under their leader Adams had settled down to a communal existence married Tahitian women and increased so in numbers that in the course of years they were too many for the island to support and in 1856 they were removed by the British Government to Norfolk Island A small number returned to Pitcairn
- Pitchblende or Uraninite** a relatively scarce mineral It is nearly all uranium oxide but lead thorium etc are also present Pitchblende from Joachimsthal in Czechoslovakia was the material in which radium was discovered by the Curies Pitchblende also occurs in Saxony Rumania Norway Cornwall the Congo and at Great Bear Lake in Canada
- Plainsong** a style of musical composition sung in unison (all voices singing the same tune with out harmony) familiar in the Western Church from very early times and still performed principally in the Roman Catholic Church Though restrained and contemplative in spirit it is capable of expressing deep emotion See B3(2)
- Planetarium** a complex optical system which projects into the interior of a dome a replica of all the phenomena of the sky that can be seen by the naked eye e.g. sun moon planets stars comets meteors aurora eclipses and clouds There is a planetarium in the Marylebone Road London and another (opened in 1966) at Armagh Observatory N Ireland
- Planets** the name given to such celestial bodies as revolve round the sun in elliptical orbits The name was first used by the Greeks to indicate their difference from the fixed stars There are nine planets Mercury Venus Earth Mars Jupiter Saturn Uranus Neptune Pluto Many important questions can be answered by means of probes sent to the neighbourhood of the planets These include the measurement of the magnetic field if any of the planets the study of their atmospheres much of which can be done without actually penetrating to the surface With instruments landed gently on the surface it is possible to investigate surface condition and composition by many methods Even without a soft landing information on these questions can be obtained by photography and subsequent transmission of the picture back to earth by some form of television scanning For example the American Mars probe *Martiner IV* transmitted pictures of the Martian surface in 1965 when it was at its closest approach to the planet and the Russian *Venus IV* in 1967 made a soft landing on Venus See F7 also under their names
- Plankton**, a word which first came into biological use in 1836 to describe the usually microscopic plants and animals floating swimming and drifting in the surface waters of the sea To be distinguished from *nekton* (swimming animals like fishes and squids) and *beniotos* (plants and animals living on the sea bottom like fixed algae sponges oysters crabs etc) Of great economic importance providing food for fish and whales
- Plantagenets** the kings who reigned in England between 1154 and 1485 and included the Houses of Lancaster and York Most correctly they are styled Angevins from Anjou of which Geoffrey father of Henry II was Count and whose badge was a sprig of broom (*Plantago genista*)
- Plasma Physics** is the physics of wholly ionised gases i.e. gases in which the atoms initially present have lost practically the whole of the electrons that usually surround their nuclei, so that the gas consists of a mixture of two components positively charged ions and negatively

charged electrons. The physical properties of a *plasma* are very different from those of an un-ionised gas. In particular a plasma has a high electrical conductivity and can carry large currents. *See also* Nuclear Fusion

Plastics a broad term covering those substances which become plastic when subjected to increased temperatures or pressures. The Plastics Industry is based on synthetic organic examples of this group. There are two classes of plastics the *thermoplastic* which become plastic every time they are heated (e.g. cellulose plastics) and *thermosetting* which undergo chemical change when heated so that once set they cannot be rendered plastic again (e.g. Bakelite). Plastics are composed of long chained molecules e.g. polyethylene.

Platinum a metal element symbol Pt. It is a scarce white metal generally allied with iridium, osmium, ruthenium and palladium. It can only be melted in an oxyhydrogen or electric furnace but can be rolled out into a film like sheet or drawn out to the finest wire being resistant to acids it is termed a noble metal.

Platonic Solids five regular solid figures known to the ancient world. They are the tetrahedron (4 triangular faces), cube (6 square faces), octahedron (8 triangular faces), dodecahedron (12 five sided faces), icosahedron (20 triangular faces). All the faces and angles of each solid are identical.

Platians were the ordinary citizens of Rome as distinct from the patricians. There was a long struggle between the two orders for political equality.

Pleades famous cluster of stars in the constellation of Taurus. Of the seven principal stars in the group one is rather faint and many myths have sprung up about this 'lost pleiad'.

Pleistocene the geological period that succeeded the Pliocene. During the Pleistocene also known as the *Great Ice Age* there were four cold periods when the ice sheets covered northern Europe and N. America, separated by warm periods when the glaciers drew back into the mountains. From recent studies based on rock magnetic measurements the transition to Pleistocene took place about 1 850 000 years ago.

Pliocene the geological period preceding the Pleistocene and the last major division of the Tertiary strata. It began about fifteen million years ago. *See* F44.

Plough Monday the first Monday after the Epiphany when in olden times the rustic population returned to work after the Christmas festivities.

Plover wading birds widely distributed over marshy places of Europe. Several species occur in Britain including the Golden plover which breeds on the moors of Devon, Somerset, Wales, N.E. Yorkshire and Scotland, and the Ringed plover, Kentish plover and Dotterel.

Pluto, the last planet to be discovered, existence established by C. W. Tombaugh at the Flagstaff Observatory in Arizona in Jan. 1930 from reckonings made by P. Lowell in 1914. It is the most distant of all the known planets, diameter about 3 650 miles. Mean distance from the sun estimated at 3 671 million miles.

Plutonium, a chemical element symbol Pu, capable of nuclear fission in the same way as Uranium 235. Not until after it had been synthesised in atomic piles during the second world war was it shown to occur in infinitesimally small traces in nature. Its synthesis in the atomic pile depends on the capture by Uranium 238 nuclei of neutrons. Immediate product of this reaction is the element neptunium, but this undergoes rapid radioactive disintegration to plutonium. Because of its explosive power and poisonous character an American scientist once remarked: 'If ever there was an element which deserved a name associated with hell it is plutonium.'

Poet Laureate is the poet attached to the royal household, an office officially established in 1665 though its origins go back to the early Middle Ages when minstrels were employed at the courts of English kings. Chaucer, Skelton and Spenser though not court poets were all unofficial poets laureate. Ben Jonson has been called the first official laureate (1616) but the office was not officially recognised until 1668 when Dryden was formally granted the

office. It is customary for the poet laureate to write verse in celebration of events of national importance. Cecil Day Lewis succeeded John Masefield as poet laureate in 1937.

Pogrom, Russian word meaning destruction. First used to describe the Tsarist attacks on the Jews in 1881 in Russia. In 1938 Hitler ordered a general pogrom in Germany, all synagogues were destroyed and nearly all Jewish shops and homes, Jewish hospitals and children's homes suffered. During the subsequent war Jews of central Europe were systematically exterminated and cold blood by the Nazis.

Poitiers Battle of was fought on Sept. 19 1356 during the Hundred Years War when Edward the Black Prince gained a complete victory over John, King of France who was taken prisoner and brought to London.

Polecat an animal of a dark brown colour about 18 in. in length exclusive of tail, the ears and face markings are white or light brown. It is carnivorous and belongs to the weasel family. Like the skunk it emits an offensive odour.

Pole Star is of the second magnitude and the last in the tail of the Little Bear constellation. Being near the North pole of the heavens—never more than about one degree from due north—it always remains visible in the Northern hemisphere hence its use as a guide to seamen.

Police a regular force established for the preservation of law and order and the prevention and detection of crime. The powers they have vary from country to country and with the type of government, the more civilised and democratic the state the less police intervention. England compared with countries abroad was slow to develop a police force and it was not until 1856 that Sir Robert Peel's Metropolitan Police Act established a regular force for the metropolis after legislation establishing county and borough forces maintained by local police authorities throughout England and Wales. Up to that time police duties were discharged by individual constables and watchmen appointed by local areas in England and Wales. Under the Police Act 1964 the former 121 regular police forces in England and Wales have been reduced by amalgamation to 47. In Scotland there are 20. In England and Wales the forces are defined according to area of responsibility.

1 County forces under a Police Committee

2 Borough forces under Watch Committees elected by the borough councils

3 Combined forces covering more than one county or borough under a body representing the constituent areas

4 The Metropolitan Police Force covering a 15-mile radius from Charing Cross under the control of the Home Secretary

5 The City of London force under a committee of the Common Council.

In Scotland there are county forces, burgh forces and combined forces. The Metropolitan Police with an establishment of about 25 000 are unaffected by the current changes. Apart from the amalgamation of police forces in the interest of efficiency other reforms recently introduced include the centralisation of criminal records, the introduction of personal radios, and the organisation of the neighbourhood beat system under which officers in cars can patrol the areas. Central authority rests with the Home Secretary in England and Wales and the Secretary of State for Scotland in Scotland. In Northern Ireland the police force is controlled by an Inspector General who is responsible to the N.I. Government. (The security forces in N.I. are under the control of the British Army.)

Pollution of the atmosphere is due chiefly to the incomplete combustion of fuels, especially coal, large particles of soot being deposited fairly quickly close to their place of origin and smaller particles (including smoke) remaining suspended in the air for a long time. Corrosion of exposed objects and damage to buildings result from the production of sulphuric acid. The introduction of more efficient furnaces, the washing of flue gases and the introduction of smokeless zones have assisted

in the abatement of smoke and other forms of pollution. Atomic weapon tests add to the load of pollution in the atmosphere (see Fall-out).

Smog (smoke laden fog) which reduces visibility to zero and affects the respiratory organs is liable to occur when the air near the earth is cooled below the dew point temperature by radiation on a still cloudless night when an accumulation of smoke over a large city cuts off daylight and produces gloom and absence of wind or vertical currents prevents the lower layers of the air from getting away. Such conditions are ascribed with the smoke laden atmosphere of large industrial towns during winter anticyclones. During the great London smog of 1952 there were 2 000 deaths over and above those expected for the time of year. Since the Clean Air Act of 1956 pollution by smoke and sulphur dioxide has continued to diminish in London winter sunshine has increased by 50 per cent and fish now live in the Thames. In 1969 a special Secretaryship of State was created to deal with pollution of the environment (air, waters in rivers and around coasts, noise, pesticides harmful to food and wildlife) and a standing Royal Commission on Environmental Pollution has been appointed. In his 1969 Reich lectures Dr Fraser Darling said most pollution comes from getting rid of waste at the least possible cost.

Polonium a radioactive element symbol Po discovered by Madame Curie in 1898 and named after her native land of Poland.

Pollergeist See J39.

Polymerisation is the linking together of small molecules to make a large long chain molecule. The general name for polymers of ethylene is Polythene a waxy like plastic solid which because of its special qualities is used in a variety of ways today.

Polytheism See God and Man J2.

Pomology the science of fruit growing.

Pontifex, the title assigned in ancient Rome to members of the college of pontifices. **Pontifex maximus** was the official head of Roman religion. It was as pontifex maximus that Julius Caesar revised the calendar in 46 B.C. and when after the rise of Christianity the popes took over the title the revision fell to them.

Pope The head of the Roman Catholic Church recognised by that Church as the lawful successor of St. Peter. He is elected by the body of Cardinals. Since 1870 when the King of Italy deposed the holder from temporal power no pope had left the Vatican between appointment and death until 1929 when peace was made between the Church and State in Italy and compensation was paid to the Holy See for the loss of temporal power. Cardinal Montini Arch-bishop of Milan was elected Pope Paul VI in 1963 on the death of Pope John XXIII.

Porcelain. The word is thought to be derived from the Italian *porcellana* indicating the texture of a piglet. The majority of porcelain made on the continent was of hard paste or true porcelain similar to that discovered by the Chinese as early as the Tang Dynasty (A.D. 618-907). It was composed of kaolin (china clay) and *petunise* (china-stone) which when fired in a kiln at a temperature of c. 1300°C became an extremely hard and translucent material. The recipe of hard paste porcelain remained a secret of the Chinese until 1709 when it was re-discovered in Europe by Johann Böttger of the Meissen factory (popularly known as Dresden). Aided by disloyal Meissen workmen factories were later established at Vienna, Venice and in many parts of Germany. Plymouth and Bristol were the only English factories to produce this type of porcelain from 1763 to 1781. Elsewhere both in England and France the material manufactured was known as soft paste or artificial porcelain which was made by blending varying white-firing clays with the ingredients of glass. The French factory of Sevres began to make some hard-paste porcelain by 1768 and by the 19th cent. such porcelain was the only type being made throughout the whole of the continent. In England Josiah Spode is credited with the introduction of 'bone-china' about 1794. This hybrid-paste was quickly adopted by many other factories and today remains the

most popular type of English porcelain. See Pottery and Porcelain Marks Section N.

Porcupine a rodent whose back is covered with long sharp black and white spikes which form a powerful means of defence. There are two families of porcupines one is confined to the Old World and the other contains the American porcupines.

Porphyry a form of crystalline rock of many varieties that in ancient Egypt was quarried and used for the decorative portions of buildings and vessels. The term is applied generally to the eruptive rocks in which large well formed crystals of one mineral are set in a matrix of other minerals.

Porpoise a highly intelligent marine mammal of the dolphin and whale family and a common inhabitant of northern seas. Porpoises travel in shoals their progression being marked by constant leaping and plungings. Their average length is from 4 to 5 ft. There are several species nearly all being confined to northern oceans.

Port a special kind of red Portuguese wine taking its name from Oporto. It was little known in England until the Methuen Treaty of 1703 when it was permitted to be imported at a low duty.

Portcullis a strong movable timber or iron grating let into the wall of the gateway to a feudal castle and capable of being lowered or raised at will. It formed an effective protection against attack in the days before firearms.

Portland Vase one of the most renowned specimens of ancient art long in the possession of the Portland family. In 1810 it was loaned to the British Museum. Here it was shattered in 1845 by a stone from a maniac's hand but has been skilfully restored. It is said to have been found in the 17th cent. in an ancient tomb near Rome. It was purchased from the Barberini family in 1770 by Sir Wm Hamilton subsequently sold to the Duchess of Portland. The vase which is actually a two handled urn stands about 10 ins high is of transparent dark blue glass ornamented with figures cut in relief in overlaid white opaque glass. It was purchased by the British Museum in 1945.

Portreeve in olden times was an official appointed to superintend a port or harbour and before the name of mayor was used the chief magistrate of London was styled the Portreeve.

Positivism See J39.

Positron the positive electron an atomic particle having the same mass but an electric charge equal but opposite to that of an electron. It was discovered in 1932. See also F14.

Post-Impressionism, a term introduced by Roger Fry to describe the exhibition of paintings sponsored by himself in London (1910-11) officially entitled Manet and the Post-Impressionists. The exhibition included paintings by Manet, Cézanne, Gauguin, Van Gogh, Seurat, Signac, works by Matisse, Rouault and the *Fauves* (q.v.) and sculpture by Maillol. In a second exhibition held in 1912 Picasso and the Cubists were also represented. The term therefore refers to the movement in modern art which reacted against the transient naturalism of the Impressionists by concerning itself primarily with colour form and solidity. Most artists today would include Cézanne, Van Gogh, and Gauguin as the main Post-Impressionists and maintain that it prepared the way for Futurism, Cubism and Expressionism.

Potassium a metal symbol K (German *Kalium*). It is similar to sodium like which it reacts violently with water. It was discovered by Sir Humphry Davy in 1807 and now generally obtained by the electrolysis of fused potassium hydroxide or chloride/fluoride mixture. Its principal minerals are carnallite and kainite and it is relatively common in rocks accounting for about 2½% of the earth's crust. An essential element for healthy plant growth. The ashes of plants are relatively rich in potassium.

Potsdam Agreement was signed by Truman, Stalin, and Acheson in Aug. 1945. By this Agreement a Council of Foreign Ministers was established representing the five principal Powers: China, France, Soviet Russia, the United Kingdom, and United States of America with the task of drawing up the peace treaties for submission

to the United Nations. It laid down *inter alia* that German militarism and Hitlerism should be destroyed, that industrial power should be so reduced that Germany would never again be in a position to wage aggressive war, that surplus equipment should be destroyed or transferred to replace wrecked plant in allied territories, that Germany should be treated as an economic whole, and that local self government should be restored on democratic lines as rapidly as was consistent with military security. The Potsdam Agreement became a dead letter with the creation of a communist régime in the Russian zone of Germany, and marked the beginning of the cold war.

Prado Gallery the great public picture collection of Madrid containing a superb collection of paintings by Velasquez, Murillo, Raphael, Titian, Dürer, Van Dyck, Rubens, Holbein etc. **Pragmatism** See 740

Prefect chief magistrates in ancient Rome. The title is now applied to the chiefs of administration of the departments of France.

Pre-Raphaelite Brotherhood was the name given to their school of thought by three British artists Dante Gabriel Rossetti, J. E. Millais and W. Holman Hunt who in 1848 revolted against the academic art of their time and advocated a return to the style of the Italian painters prior to Raphael—the simple naturalism of the primitives such as Botticelli, Fra Angelico and Filippo Lippi. Thus they avoided the use of heavy shadows and painted on a white ground in bright colours—a technique which aroused the ire of those used to the dark and murky canvases of the contemporary romantic artists. Although they held these principles in common the three members of the P.R.B. as it was popularly called, were really quite different in other respects. Thus Rossetti (who for some reason is always thought of as the typical Pre-Raphaelite) produced works of a highly romanticised mediaevalism which apart from certain aspects of technique bear not the slightest resemblance to the sentimental naturalism of Millais or the much more dramatic realism of Holman Hunt (e.g. in *The Scapeloat*). The Brotherhood was later joined by a number of lesser artists but its works are not commonly accepted with enthusiasm to day when the general feeling is that they are sentimental and religious rather than the product of deeply felt emotions. Ruskin in his writings defended their work but the movement came to an end in 1853.

Presbyterianism See 740

Press Gang a body of sailors employed to impress men into naval service frequently resorted to in England especially during the war with France in the early 19th cent. Press gangs were no used after about 1850.

Primitive Art The word primitive has a number of different meanings: (1) the art of prehistoric communities (e.g. the famous animal cave drawings of the Aurignacians c. 25,000 B.C. at Altamira in Spain); (2) the art of modern primitive communities (e.g. Bushman rock paintings); (3) child art; (4) peasant art which springs from a spontaneous desire to impart beauty to objects of daily use and shows a tendency towards abstraction. Peasant art has many features in common with the world over the woodcarving of the Norsemen being almost indistinguishable from that of the Maoris; (5) the modern school of primitive painting in which naïveté of presentation is either the aim of a highly sophisticated mind (e.g. the self-taught French painter Le Douanier Rousseau (d. 1910)) or arises naturally from a simple one (the American grandma Moses (d. 1961) who began to paint in her seventies).

Printing by movable types first used in Europe in 1454 by Johann Gutenberg, a citizen of Mainz. The invention is also claimed for Laurens Koster of Haarlem. It was introduced into England by Caxton who set up a printing press in Westminster in 1476. Gothic characters were first used, being superseded by Roman letters in 1518. In 1798 Eli Stanhope replaced the wood printing press by one of iron. In 1814 Friedrich Koenig applied the principle of steam power to the press. Mr John Walter of *The Times* newspaper was the first to use the steam press. Improvements were introduced

by Applegarth and Cowper in 1828 and great strides were made in 1858 when the Hoe machine was put on the market. Then came the Walter press in 1866 which printed on continuous rolls of paper from curved stereotyped plates. The Monotype machine casts single letters and the Linotype whole lines. The term letterpress is used for all printing methods using plates where the characters stand in relief. The other main printing methods are *intaglio* and *planographic*.

The Privy Council is the Sovereign's own council consisting of about 800 persons who have received entrance in some branch of public affairs (Cabinet ministers must be Privy Counsellors) on whose advice and through which the Sovereign exercises his or her statutory and a number of prerogative powers. From it have sprung many organs of the constitution and many of our government departments have grown from committees of the Privy Council. For example the Judiciary or courts of justice have grown from the Sovereign's Council sitting as a Court of Justice and today the Judicial Committee of the Privy Council is a body of distinguished lawyers acting as a Court of Appeal from courts of the Commonwealth.

Probation Officers are attached to particular Courts sometimes a Magistrates' or a higher Court. Sometimes an offender is not sentenced to punishment but is released on probation that is on the condition that he behaves well and follows directions given by the Court or by a probation officer. Such an officer is a trained man (or woman) who advises, assists and befriends people who are placed under his supervision by a court of law. The probation officer by his assessment of the social background of the offender can advise the court upon the wisdom of putting the offender on probation. The probation officer by his understanding can so befriend an offender as to provide a basis for his rehabilitation. He undertakes the after care of those released from prison or Borstal. A juvenile offender or in need of care may be made subject to supervision by a probation officer or local authority. See also **Juvenile Courts**.

Productivity Physical productivity is the output of products during a time unit e.g. so many products per man hour or day or year. Total productivity is the sum of all the units of product created during the given time. Labour productivity is the part of the total that is attributed to labour as a factor of production. Productivity of capital is the element attributed to capital as a factor. Productivity of land is the element attributed to the natural powers of the soil as distinct from what is contributed by the application to it of capital or labour. The term productivity is also used to refer not to the quantity of output, but to its money value.

Propane a colourless inflammable gas made of carbon and hydrogen formula C_3H_8 . It is easily liquefied and transported liquid in cylinders and tanks. In this form it is familiar as a portable gas supply for domestic and industrial uses. It is sometimes mixed with butane (C_4H_{10}) for this purpose. Propane occurs in natural gas and is a by-product of oil refining.

Proteins are the main chemical substances of living matter they are a part of every living cell and are found in all animals and plants. Proteins have many functions and occur in structural matter such as bones, tendons, skin, hair and hoof and in some vitamins and hormones. Lean meat, fish and eggs are almost entirely proteins. Their composition varies with the source but all proteins are basically constructed of carbon, hydrogen, oxygen and nitrogen and some contain sulphur, phosphorus (nucleoproteins) and iron (haemoglobin). Proteins are built up of very long chains of amino acids connected by amide linkages (the synthetic polymers such as nylon and casein plastics (from milk)) are built up of the same linkages. Enzymes which bring about chemical reactions in living cells are proteins having specific properties. See F27(1).

Proton, a basic constituent of the atomic nucleus, positively charged having a mass about 1836 times that of the electron. It is a positive hydrogen ion. See F10(2) 14.

Prout's hypothesis The English chemist William

- Prout (1785-1850) advanced the idea that all atoms are made of hydrogen and that weights are exact multiples of the weight of a hydrogen atom. With the modification that neutrons as well as protons occur in the nucleus Prout's belief though rejected for many years has been substantially vindicated.
- Provost** - A Scottish official similar in rank to an English mayor. The Provosts of Edinburgh, Glasgow, Aberdeen, Perth and Dundee are styled Lords Provost. The title of provost is also given to the heads of certain colleges.
- Prud'hommes** (Prudent Men) Councils of were French trade tribunals of masters and workmen formed to decide on disputes. Originally a mediaeval institution they were revived by Napoleon in 1806 and were carried on by the Third Republic.
- Psalms** Book of for many years attributed to David but present day scholars are of opinion that the psalms were written by a series of authors at different times and for different purposes and that few if any were written by David. The Holy Scriptures contain 150.
- Psychedelium**. See J40
- Psychic Research**. See J41
- Psychoanalysis**. See J42
- Ptarmigan** birds of the grouse family one species of which inhabits the Scottish Highlands. In the winter the bird assumes a white plumage.
- Potamines** amino acids produced during the putrefaction of proteins of animal origin. Not a cause of food poisoning as was once generally supposed which is almost invariably due to certain specific bacteria.
- Publicans** under the Roman Empire were people who farmed the public taxes. It is this class of officials that is alluded to in the publicans and sinners phrase in the New Testament.
- Public Corporations** statutory bodies which operate major industries and services in the public interest. e.g. UK Atomic Energy Authority, Bank of England, B.I.C. Electricity Authorities, Gas Council, National Coal Board, British Steel Corporation, British Railways Board. They are accountable to Parliament but their staffs are not civil servants. The Post Office became a public corporation in 1969 responsible to the Minister of Posts and Telecommunications.
- Public Schools** The Public Schools Act of 1864 named nine public schools: Eton, Harrow, Rugby, Winchester, Westminster, Shrewsbury, Charterhouse, St. Paul's and Merchant Taylors. Today the term embraces many more and can be applied to all those schools which are financed by bodies other than the State and whose headmasters belong to the Headmasters' Conference as distinct from the Headmasters' Association. There are about 200 such schools in Britain, including among others Bedford School (founded 1552), Brighton College (1845), Charterhouse School, Godalming (1611), Cheltenham College (1841), Christ's Hospital, Hove (1558), City of London School (1442), Clifton College, Bristol (1862), Dulwich College (1619), Eton College (1440), Felsted School (1564), Haileybury College (1862), Harrow School (1871), King Edward's Birmingham (1858), King's School, Canterbury (900), Lancing College (1848), Malvern College (1861), Manchester Grammar School (1615), Marlborough College (1848), Merchant Taylors School (1661), Mill Hill School (1907), Oundle (1558), Radley (1847), Repton School, Derbyshire (1657), Rugby School (1587), St. Paul's School (1509), Sevenoaks School (1418), Sherborne School (1550), Shrewsbury School (1552), Stonyhurst College (1598), Tonbridge School (1558), Uppingham School (1584), Wellington College (1859), Westminster (1560), Winchester College (1382), and Warwick (814). Public schools for girls include Christ's Hospital, Hereford (1552), Cheltenham Ladies College (founded by Miss Beale in 1868), North London Collegiate School (founded by Miss Buss in 1850), Roedean (1885), Wycombe Abbey (1896).
- Pulsars**, cosmic objects discovered in 1967 by the radio astronomy group at Cambridge of great scientific interest because they are probably made of highly compressed matter. Unlike quasars ($q\gamma$) they are near objects—all are contained in the Milky way. See F5
- Puma**, a carnivorous mammal of the cat family found in the New World from Canada to Patagonia.
- Pyramid** of Egypt on the west bank of the Nile are vast stone or brick built structures with inner chambers and subterranean entrances built by the Pharaohs as royal tombs and dating from about 3000 B.C. The most celebrated are at Giza built during the 4th dynasty. The largest originally 481 ft. high, is called the Great Pyramid one of the seven wonders of the world built by the Pharaoh Khufu better known as Cheops and there he was buried 100,000 men according to Herodotus being employed for 20 years upon it. Chephren successor of Cheops erected the second pyramid and the third was built by Mycerinus a son of Cheops. The pyramid at Meidum built by King Snefru founder of the 4th dynasty is the most imposing of all American and Egyptian scientists are cooperating in a project to X-ray (by means of cosmic rays) the interior of the Pyramid of Chephren.
- Pythons** large snakes non poisonous and destroying their prey by crushing it. Some species average 30 ft. in length and prey upon deer and other small mammals. Found in Asia, Africa and Australia. They lay eggs.

Q

Quadrant an astronomical instrument for measuring altitudes superseded for navigational purposes in modern times by the sextant. It consists of a graduated arc of 90° with a movable radius for measuring angles on it.

Quai d'Orsay An embankment in Paris where the French Foreign Office is situated.

Quail an edible bird of the partridge family of which only one species the Common Quail is found in England. It is not more than 8 in. long. It is found in most of the warmer regions of the world. In England and Wales the Quail is covered by the Wild Bird Protection Acts.

Quair an old name for the Wild Bird Protection Acts.

Quantum Theory The rapid development of quantum theory has been almost entirely due to the experimental and theoretical study of the interactions between electromagnetic radiation and matter. One of the first steps was taken when it was discovered that the electrons emitted from metals due to the action of ultra violet radiation have an energy which is not related to the intensity of the incident radiation but is dependent on its wavelength. Einstein showed in 1905 that this could only be explained on the basis that energy is transferred between radiation and matter in finite amounts or quanta which are inversely proportional to wavelength. See F13(1).

Quarks are hypothetical subnuclear particles recently postulated by theoretical physicists concerned with the so called elementary particles. There are supposed to be three kinds all carrying electrical charges which are fractions of those carried by familiar particles like electrons and protons. This and other special properties of quarks make them suitable for explaining the existence of the large number of other particles referred to on F13 14. The physical existence of quarks may be demonstrated by experiment at any time and if this happens it will be an exciting triumph for speculative theoretical physics.

Quartering in heraldry is the disposition of various escutcheons or coats of arms in their proper quarters of the family shield in such order as indicates the alliances with other families.

Quartermaster a military officer charged with the provisioning and superintendence of soldiers in camp or barracks and holding the equivalent rank to a lieutenant. The Quartermaster General is an officer who presides over the provisioning department of the whole army. A Quartermaster in the Navy is a petty officer responsible to the Officer of the ship and in harbour for the running of the ship's routine.

Quarto, a sheet of paper folded twice to make four leaves, or eight pages abbreviated to 4to.

Quartz is a common and usually colourless mineral, occurring both crystallised and massive. In

the first form it is in hexagonal prisms terminating in pyramids. When pure its specific gravity is 2.65. It is one of the constituents of granite, gneiss, etc. Among the quartz varieties are *rock crystal* (colourless), *smoky quartz* (yellow or brown), *amethyst* (purple), *rose quartz* (pink), and *milk quartz* (white). Quartz veins in metamorphic rocks may yield rich deposits of gold. Mining for gold in the rock is termed *quartz mining*.

Quasars or in preferred terminology *quasi-stellar radio sources* form a new class of astronomical object first identified in the period 1960 to 1962. They have enormous energy output and are at vast distances. Many are strong sources of radio waves and fluctuate in intensity. Their nature and cosmological significance presented the major astronomical problem of the 1960s. In the view of Professor Philip Morrison of the Massachusetts Institute of Technology quasars are the condensed remains of entire galaxies while pulsars (*q.v.*) seem to be the ashes of a star that has exploded. Both he suggests contain a core of highly concentrated magnetised material. See F5.

Queen Anne's Bounty established by Queen Anne in 1701 for the augmentation of the main tithes and the poor clergy. Since April 1 1948 Queen Anne's Bounty and the Ecclesiastical Commissioners ceased to exist and became embodied in the Church Commissioners for England.

Queen's (or King's) Speech is the speech prepared by the Government in consultation with the Queen and delivered by Her Majesty in person or by her deputy at the opening or closing of Parliamentary session.

Quicksilver See Mercury.

Quinine, a vegetable alkaloid obtained from the bark of several trees of the *Cinchona* genus. It is colourless and extremely bitter. The drug sulphate of quinine is one of the most valuable medicines forming a powerful tonic. It is antiperiodic, antipyretic and antineuralgic. In cases of malaria it is the most efficacious remedy of natural origin known.

Quirinal, one of the seven hills of Rome.

Quisling term which came into use during the second world war to denote traitor collaborator or fifth columnist. After Vidkun Quisling who became head of the puppet government after the German invasion of Norway in 1940.

Quorum, the number of members of any body or company necessary to be present at any meeting or commission before business can be transacted. The House of Commons needs a quorum of 40, the Lords a quorum of 3.

R

Rabbi, a Jewish term applied to specially ordained officials who pronounce upon questions of legal form and ritual and also generally accorded to any Jewish scholar of eminence.

Rabbit. See Z17.

Raccoon plantigrade carnivorous mammals common to the American continent. There are several species. The common Raccoon (*Procyon lotor*) is about 2 ft. long with a bushy ringed tail and sharp snout. Its skin is valuable.

Race In the old text books anthropologists were much concerned with the differences between the various races of Man. They described the Black Man (Negro), the Yellow Man (Mongol), the Red Man (American Indian), the Brown Man (Indian) and the White Man (European). Those who study Man from this point of view further subdivide each group into others. Thus White Man may be divided into Nordic, Alpine and Mediterranean. Black Man into Hamitic, Bushman and so on. Each of these groups tends to have physical traits which its members hold in common, although of course there are no pure racial types. All existing races have been fairly thoroughly mixed. What in view of recent experience is really important is that races or even nations do not have psychological traits—at least not innate traits. Anthropology dismisses all theories of a superior race as unscientific; there is not the slightest evidence that one race differs in any way from another in its psychological

potentialities. Jews, Irish, Scots, Italians do differ (as do the inhabitants of Edinburgh and London) but their differences are due to their situation and not to anything inborn. See F49.

Raceme an inflorescence in which the main stem bears stalked flowers *e.g.* lupin, foxglove. The youngest flowers are at the tip of this axis.

Radar The basic principle of radar is very similar to that of sight. We switch on a light in the dark, and we see an object because the light waves are reflected from it and return to our eye which is able to detect them. Similarly the radar station sees an object because the invisible radio waves sent out from the transmitter are reflected from it and return to the receiver which is able to detect them. Thus radar is the use of radio signals that man broadcasts.

The utilisation of radio waves for the detection of reflecting surfaces began with the classical experiment of the late Sir Edward Appleton in 1925 which he conducted in order to demonstrate the existence of the Heaviside layer in the upper atmosphere. During the course of the last war developments took place which tremendously improved the methods and instruments used. As in the case of so many of the inventions primarily developed for the purpose of waging war, many useful applications have been found for radar in times of peace, and in particular it has proved of great service as an aid to aerial and marine navigation and in meteorology and astronomy. Radar astronomy investigates the solar system with the echoes of signals sent out from the Earth.

Radiation energy emitted in the form of a beam of rays or waves *e.g.* acoustic (sound) radiation from a loudspeaker, radiant heat from a fire, β radiation from a radioactive substance. The radiation of electromagnetic waves from a body depends on its temperature: the amount of energy radiated per second being proportional to the fourth power of the absolute temperature. The hotter the body the shorter the wave lengths of the radiation, thus the colour of a glowing body depends on its temperature. Of paramount importance to us is radiation from the sun. Amongst other radiations the sun sends ultra violet, visible and infra red (heat) waves. The principal gases of the atmosphere are transparent to practically all of the solar and sky radiation and also that which the earth re-transmits to space. Carbon dioxide and water vapour however strongly absorb certain types, the latter as clouds playing an important rôle in regulating the temperature of the globe. The cooling of the ground on a clear night is a result of the outgoing long wave radiation exceeding that coming down from the sky; at sunrise cooling ceases as the incoming radiation becomes sufficient to compensate for the loss of heat.

Radiation, Cosmic. See F3(2).

Radio The theory of electromagnetic waves—of which the radio wave is one—was originated by the British physicist James Clerk Maxwell (F12). He showed that both electrical and optical phenomena in space are essentially similar in character and that the waves if short in wavelength are those of light and if of longer wavelength those of radio waves. Heinrich Hertz made many useful discoveries about the waves themselves and about their behaviour under differing conditions and also about the apparatus for producing them. Marconi developed the use of radio waves as a practical means of communication.

Radio methods are vital for the transmission of observed data from space vehicles back to earth, a process known as *telemetering*. This is done by converting the observations into electrical pulses which actuate a suitable radio transmitter so that it radiates a signal, in coded form which can be received at a ground station and decoded. The transmission of such a signal can also be remotely controlled by means of signals from the earth. Photographic and television techniques may also be employed for obtaining the desired information and sending it back to earth, as in the case of the Russian picture of the reverse side of the moon and the American pictures of the lunar surface. The information may be stored within the spacecraft for a time and

then upon receipt of a particular radio signal from the earth transmitted by the spacecraft at a time convenient for its reception. Soviet scientists by a special technique were able in the case of their *Venus IV* probe (Oct. 1967) to parachute an instrumented canister from the spacecraft so that it could descend slowly to the surface of the planet—a feat described by Sir Bernard Lovell who was recording the enterprise at Jodrell Bank as an experiment of classic elegance. See also **Radio Astronomy** **Telemetry**

Radioactivity is the spontaneous transformation of atomic nuclei accompanied by the emission of ionising radiations. It was discovered in 1896 by Becquerel who noticed that salts containing uranium sent off radiations which like X rays can blacken a photographic plate. Two years later Marie and Pierre Curie discovered several new chemical elements which possessed the same property but many times more intense than uranium the most important of these was radium. Shortly afterwards it was established mainly by Rutherford that these types of radiations called α , β and γ rays are emitted from radioactive substances. It was also Rutherford who jointly with Soddy deduced that the emission of the radiations is associated with the spontaneous disintegration of atoms which result in the transformation of one radioactive substance into another. A series of such transformations ends when a stable element is produced. All of the heavy radioactive elements can be arranged in three radioactive series called the uranium, thorium and actinium series. Initially radioactivity was thought to be a property confined only to a few elements occurring in nature. In 1934 however Irene and Frederick Joliot Curie discovered that ordinary elements can be transformed into radioactive forms by subjecting them to bombardment with α particles. Following this it was found that beams of other fast particles produced in accelerators can also render ordinary substances radioactive. Nowadays it is known that radioactivity is a general property of matter any chemical element can be produced in one or more radioactive forms or isotopes. See **F11**

Radio Astronomy The science of radio astronomy makes use of radio apparatus and techniques for the observation of events occurring in far distant parts of the universe and in so doing is able to enlarge upon the observational field of optical astronomy in a remarkable way. By means of radio telescopes it is possible to observe parts of the universe so far distant that the radio waves received have taken thousands of millions of years to travel from their source to the earth and thus to observe happenings which may have occurred near the beginning of the history of the universe. Thus radio astronomy works with signals that are broadcast by objects in space.

There are two main types of radio telescope. The first known as the interferometer uses aerials spaced at large distances so as to cover a wide tract of ground. This has a high resolution but suffers from the disadvantage that it can observe only a very limited area of the sky overhead, as the earth turns upon its axis. The second and steerable type is that of the radio telescope at Jodrell Bank, Cheshire which consists of an enormous concave metal bowl with the radio aerials at its centre. Thus though it has a lower resolution it can be directed or steered on to any part of the sky which is above the horizon and so can under take a much more comprehensive observational programme. It can be used either to receive radio waves coming from desired sources or to transmit them and then pick up the echo from for example the moon or a planet as in radar.

One source of radio waves which can be detected by radio telescopes is our own sun whose behaviour under quiet and abnormal conditions can be observed in this way. Some of the planets also appear to emit radio waves from parts of their surface. But much more remarkable are the waves which are received from quasars (*q v*).

Radiosonde, a weather station in miniature carried

aloft by a free balloon to heights normally in the neighbourhood of 10 miles. Signals representative of values of atmospheric pressure, temperature and humidity are transmitted simultaneously by radio to ground receiving apparatus. The position of the balloon at any instant can be determined by radar enabling the speed and direction of the upper winds to be deduced.

Radium a radioactive metal symbol **Ra** discovered by Marie and Pierre Curie in 1898. Atomic weight 226. The Radium Institute founded and equipped by Lord Iveagh and Sir Ernest Cassel was opened in 1911 for the treatment of patients and research into the effect of radium on the human system. Radiotherapy (use of X rays from radium) is used in the treatment of cancer.

Radon a radioactive gaseous element symbol **Rn** formed by radioactive decay of radium. Its discovery completed the series of elements known as the inert (or rare) gases.

Rail a well known genus of the *Rallidae* family including the Water Rail, the Moorhen, Corn crane and Coot resident in the British Isles.

Rain When moist air rises into lower temperatures and becomes saturated condensation takes place on the numerous hygroscopic particles present in the atmosphere. If the temperature is above freezing a cloud of small droplets is formed and as the air continues to rise they grow in size until the weight is great enough to make them fall to the earth as rain. The formation of large raindrops has been attributed to coagulation of smaller drops of different sizes while another mechanism depends upon the presence in the cloud of ice crystals as well as water drops. In temperate latitudes snowflakes falling from the freezing level melt in the warmer air below producing large raindrops which grow in their flight through the lower part of the cloud.

Rainbow a beautiful colour effect visible to an observer with back to the sun and facing a rain shower caused by the refraction and reflection of sunlight in minute water droplets in the air. From high in the air it would be possible to see a rainbow as a complete circle but from the ground the most that can be seen is a semi-circle when the sun is just on the horizon. The higher the sun is the smaller the arc of the rainbow. When conditions are suitable two bows are seen the secondary with the colours of the spectrum reversed. The colours of the rainbow are seven red orange yellow green, blue, indigo and violet—the colours of the spectrum. See also **Aurora**

Rain gauge an instrument consisting of a deep metal funnel whose stem dips into a graduated glass jar from which the depth of the rain water collected can be read. Continuous records of rainfall are provided by self registering instruments.

Rain Making is a facility long desired by mankind especially in the drought ridden regions and attempted throughout history by numerous non scientific means. Since the Second World War it has been proved that clouds can sometimes be made to rain or snow by dropping into them from an aeroplane very cold particles of solid carbon dioxide or certain chemicals. This makes the moisture of the cloud form tiny ice crystals which grow big and finally fall out of the cloud. The process is quite complicated and not fully understood and the practical exploitation is somewhat chancy at present but experiments have been made in many countries and the United States has a considerable programme of study. As well as scientific there are commercial and legal problems. The premature commercial exploitation has resulted in disillusionment in some cases.

Rambouillet, a royal French château (14th cent. rebuilt 18th cent.) near Paris and the official summer residence of the President of the French Republic. Also the name of the famous literary salon of the Marquise de Rambouillet (1588–1665).

Rampant in heraldry is a term applied to the figure of an animal with forelegs elevated the dexter uppermost. When the animal is shown side faced it is **rampant displayed** when full face **rampant guardant** when looking back.

rampant regardant and when in sitting position *rampant segant*

Rape a cruciferous plant yielding coleseed or rape seed extensively grown in all parts of Europe and India. Rape oil or colza is made from the seeds and the leaves and refuse are used for sheep food. Rape oil is a yellow thick oil of considerable commercial importance as a lubricant and for other purposes. It was at one time much used as an illuminant.

Rare Gases (also called Inert Gases). These are a group of elements which are chemically inert, comprising helium, neon, argon, krypton, xenon and radon. Cavendish in 1785 noticed that there was in air some gas which was not oxygen, nitrogen or carbon dioxide but it was not until 1894 that the first of the rare gases was found by Rayleigh and Ramsay. Thus they called argon (inert). After the discovery of helium in 1895 by Ramsay, Rayleigh and Travers, soon isolated the other gases except radon which was later detected as a radioactive decay product of radium. Some of these inert gases are used to fill electric light bulbs and helium is used in balloons, since it is very light.

Rat a well known order of rodent embracing many species. The brown rat appeared in Europe early in the 18th cent. coming from the East and entering, by way of Persia, now it is widespread and met with in Britain and all parts of the Continent. The black rat which was the common rat before the arrival of the brown species is a smaller animal and now comparatively scarce. There are numerous other kinds all of them gross feeders and existing in such numbers in many places as to constitute a pest. See Z13.

Rationalism See J43

Rattlesnake venomous snakes which obtain their name from the possession of a rattle in the end of their tail consisting of horny pieces so arranged that when vibrated they make a rattling sound. They are only found in N and S America.

Raven a black plumaged bird of the crow family with raucous voice and massive bill. Occurs in many parts of Europe, Asia and America. Ravens are easily domesticated and form interesting pets. Dickens had one which he described in *Barnaby Rudge*.

Ray fish with a very flat body and broad and fleshy pectoral fins related to the sharks. There are about 140 species. In Britain they are generally called *skate*.

Razorbill a sea bird of the auk family having a high furrowed bill and black and white plumage. It inhabits rocky cliffs during the breeding season and at other times is mostly out on the open sea.

Realism is a vague term. For its use in philosophy see J44(1). As a movement in art it can be said to have started with Gustave Courbet in the mid 19th cent. in his revolt against the classicism of Ingres and the romanticism of Delacroix. He was a man of strong radical views and like Zola, Balzac and Maupassant in literature turned to the actuality of everyday life recording it with frankness and vigour. Some young English painters notably Brautry of the Kitchen sink school practise what some describe as social realism. In another sense realism is an attitude concerned with interpreting the essential nature of the subject revealing truths hidden by the accidentals of ordinary visual appearance. Thus form becomes more significant than content. Beginning with Cézanne and Van Gogh this trend passes on to Cubist and Abstract painting.

Record Office in Chancery Lane, London, the place where the Public Records of England are preserved including Domesday Book, the various Rolls of Charters and important historical documents.

Rectifier an electrical device which will allow electric current to flow in one direction only and can therefore be used for turning alternating current into direct current. Since electricity is usually supplied in alternating form and frequently needed in direct form rectifiers are of very common use both in industry and the home, for example in radio and television and for battery chargers. Rectifying properties are possessed by a number of different devices one of which is a thermionic diode (see Valve).

Very large valves filled with mercury vapour are often used for rectifying heavy currents for industrial purposes. Many other rectifiers use semiconductors in close contact with metals or with other semiconductors because such junctions have the property of passing electric current easily only in one direction.

Reconnaissants people who refused to attend the Anglican Church or to acknowledge the ecclesiastical supremacy of the Crown in the 16th and 17th cent.

Red Crag the name given to a strata of gravel or sand containing certain fossil mollusc deposits found on the Suffolk and Norfolk coasts.

Red Cross See Geneva Convention

Red Letter Day a Church festival day indicated in the Prayer Book by red letters, now a popular term for any day of special significance.

Redstart a small bird of the Thrush family of handsome plumage and striking song. Two species visit Great Britain, the Common Redstart with bright chestnut rump and tail, white forehead and black cheeks, favours wooded country and the Black Redstart with black breast and throat, chestnut tail and white wing bars, prefers rocky ground or bombed buildings and has recently begun to breed in S. England.

Redwing a bird of the Thrush family which finds its way to this country for the winter. It resembles the song thrush but distinguished by smaller size, buffish white eye, stripe, chestnut flanks and underwings. It has bred in Scotland and on Fair Isle.

Redwood or Sequoia This genus of coniferous tree comprises two species of Redwoods occurring in N.W. America. Specimens of one species, the Giant Redwood, reach a height of over 300 ft and a thickness of 30 ft. The age of the largest, the General Sherman tree, is put at 3,500 years.

Referendum and Initiative two methods by which the wishes of electors may be expressed with regard to proposed legislation. It is developed to the highest extent in Switzerland. In a referendum some specific matter is referred to the electors. The Initiative is the means by which electors can compel their representatives to consider a specific issue. After consideration by the legislature it must then be submitted to the electorate for approval (see a referendum).

Gen. de Gaulle made use of the referendum in seeking the consent of the French nation for his policies. In a democracy a referendum should be preceded by a programme of education and public debate.

Reformation See J44 29

Reform Bills The principal Bills have been passed for the reform of the Parliamentary franchise. The first was the great Reform Bill of 1832 introduced by Lord John Russell and enacted under the Whig administration of Lord Grey. In addition to a sweeping redistribution of seats this Act greatly extended the franchise but still left many people without the right to vote. The second Bill passed by Disraeli in 1867 by giving the vote to workers in towns established household suffrage. A third Bill passed in 1884 under a Gladstone ministry removed the distinction between borough and county franchises, enfranchised agricultural workers and thus gave the vote to all men over 21. Women had to wait until 1918 to get the vote at the age of 30. The Representation of the People (Equal Franchise) Act 1928 gave them the right to be registered as Parliamentary electors at the age of 21, thus making England into a true democracy. The Representation of the People Act 1948 abolished the representation of the universities and the separate representation of the City of London and the business premises vote.

Refraction The change of direction which light rays and other rays undergo when passing from one medium to another. The phenomenon is due to the fact that in different media light (and other forms of radiation) has different speeds.

Refractory a substance capable of standing high temperatures and therefore useful for making furnaces and allied apparatus. Some insulating refractories are fire-clay, alumina, porcelain, carborundum, graphite and silica. Some refractory metals are platinum, molybdenum.

tungsten tantalum and the alloy melchrome chromel alumel

Reindeer A genus of deer horned in both sexes occurring only in northerly regions. It has an average height of 4 ft 6 in. is very fleet of foot and the Laplanders utilise it for draught purposes and for food

Relativity The laws of relativity have been substantially proved and have revolutionised our ideas as to the nature of space time and matter and energy and forced us to think along new lines. In 1949 a new theory by Einstein was announced which sets forth in a series of equations the laws governing both gravitation and electromagnetism which is said to bridge the gap that separates the universe of the stars and galaxies and the universe of the atom. At present the one is explained by relativity and the other rests on the quantum theory. See F15

Relief In sculpture is of three kinds—high relief (*alto relief*) in which the figures stand out to the extent of one half of their natural proportions low relief (*baso relief*) when the figures project but slightly and middle relief (*mezzo relief*) when the projection is intermediate

Renaissance See J44

Republican Party of the United States. was born by the fusion in 1854 of the group who called themselves National Republicans having split from the Democrats over tariffs in 1825 and the northern Democrats both of them being opposed to slavery. It came to power when Abraham Lincoln was elected President in 1860 and won 14 of the 18 presidential elections held between 1860 and 1932. It was defeated in 1932 largely as a result of the economic depression and reached its lowest ebb in the years of Roosevelt's New Deal (qv). The Party went on being defeated every four years until Eisenhower's victory in 1952. Nixon narrowly failed to defeat Kennedy in 1960 and Goldwater was decisively beaten by Lyndon Johnson in 1964. In 1968 Nixon was successful in winning the Presidency. The Party has its interventionist and its isolationist wings its hawks (conservatives) and its doves (liberals). The symbol of the party is an elephant the invention of Nash a cartoonist in 1874

Requiem Properly a mass for the dead the term is extended to cover musical settings by Palestrina Mozart Verdi and others

Reredos the ornamental screen at the back of the altar or communion table. It is often of a highly decorative character and is an architectural feature in many churches in Spain. Other examples are to be found in the following cathedrals in England Southwark St Albans Winchester Durham and Liverpool.

Resins natural resins are vegetable compounds largely employed in the industrial arts. They comprise india-rubber amber mastic copal etc. Synthetic resins is a term sometimes used as a synonym for plastics

Reuter an international news agency organised since 1941 as a trust and owned by the news papers of Britain Australia and New Zealand founded by Baron J de Reuter in 1849

Rhea a large flightless bird the ostrich of S America distinguished from the ostrich proper by smaller size longer beak larger wings no tail and 3 toes instead of 2. There are 2 species

Rheology the science of flow. See F17(2)

Rhesus Factor See Index to Section P

Rhinoceros a large hoofed quadruped of which there are nine existing species native to the river and marsh regions of Africa India Borneo and Java. It is remarkable for its thick hide and upturned snout from which springs a long horn. The white rhinoceros which is scarce is the heaviest species attaining a length of 10-12 ft and a height of from 5 to 6 ft.

Rhodium a metallic element symbol Rh discovered by Wollaston in 1804. It is found in platinum ores in small amounts, generally less than 2 per cent. With platinum it gives a very hard and durable alloy. It is also used instead of silver in putting the reflecting layer on a mirror.

Ribbon Fish or Carish a deep-sea fish deriving its name from its ribbon-like shape. Though many feet in length it is only an inch or two thick. The ribbon fish is rarely met with because of its habitat and most of what is

known about it has been learnt from specimens occasionally cast ashore during storms

Rice a grain yielding grass of which thousands of strains are known today extensively cultivated in China India and certain parts of America and forming the main food of the peoples of China Japan India and the Malayan regions. Some 95 per cent of the world's rice is produced and consumed in the Orient. The grain with the husk is known as paddy. Arrack an alcoholic liquor is made from fermented rice seeds.

Rime a crystalline deposit of ice formed on objects exposed to wet fog at the same time as frost

Rinderpest or Cattle Plague is a highly contagious disease affecting cattle sheep and other ruminants. In Europe the disease has been eradicated but it was formerly very widespread and caused great loss of life amongst cattle. The disease is caused by a filtrable virus and is attended by fever and congestion of the mucous membranes.

Ring Dove or Wood Pigeon a blue grey bird distinguished from other pigeons by larger size (16 in.) white wing bar gold tinge on the face and purple neck and white half collar. It is very common in Britain.

Ritual the book of rites used in the Roman Catholic Church for the administration of certain sacraments and other church ceremonies. Like the Roman breviary it dates in its present form from the Council of Trent.

RNA (Ribonucleic Acid) See Nucleic Acids

Roaring Forties name applied to the prevailing westerly winds over the oceans in the temperate latitudes of the Southern Hemisphere.

Robin (or Redbreast) A small bird with olive brown upper parts and orange red forehead throat and breast both sexes look alike. The young are speckled lacking the red breast. Its wide European distribution includes the British Isles where it is the national bird. It also occurs in N Africa and W Asia. The nest is placed in a great variety of situations including holes in banks trees and walls in sheds amongst ivy and sometimes in old tins. Nesting boxes are readily adopted but care should be taken to ensure that the entrance hole is small enough to exclude starlings. Robins are pugnacious and defend their territories with vigour. Then at active appearance trustful disposition engaging ways and sweet song make them extremely popular. The name robin is also applied to a number of very different birds one of which the American Robin occasionally wanders to Europe.

Rock Dove the grey pigeon *Columba livia* of Europe and Asia ancestor of the domestic pigeons as Darwin was the first to show.

Rockets for use in war were first studied by Sir William Congreve early in the 19th cent and proved very destructive in siege operations. They were invented by the Chinese as long ago as the 11th cent. The Germans devised the huge V2 rocket carrying a ton of explosive which was used near the end of the war to bomb hard London. Rockets are propelled by the burning of fuel (e.g. oxygen or nitric acid) the exhaust being ejected at high velocity thrusts the rocket forward. For the study of the properties of the atmosphere vertical sounding rockets are used. Rocket flight in outer space was first presented as practicable by the Russian rocket expert K. E. Tsiolkovsky in 1903. The provision of sufficient launching velocity involves the use of rocket motors with adequate thrust. To launch a satellite into an orbit circulating within a few hundred miles of the surface a velocity of 18 000 m.p.h. must be imparted. This may be done by using a multi stage launching system. When the first stage motor has burned out it drops off so that when the second stage motor ignites it does not have to support the weight of the first stage and so on. If the launching velocity is increased to 25 000 m.p.h. the vehicle will not return to the neighbourhood of the earth but pass out of the range of the earth's gravitational pull completely. Unless the launching velocity reaches 100 000 m.p.h. it will not escape from the sun and will become an artificial planet. See also Space Research.

Rock Magnetism. The study of naturally occurring magnetism in rocks is a subject which has gained considerable importance in recent years.

There are two principal reasons for this. One is that this so-called fossilised magnetism may be able to tell us more about the past history of the earth's magnetic field. The other is that after many years of heated dispute between geologists rock magnetism promises to settle once and for all the controversy as to whether or not the continents have changed their relative positions in past times (continental drift theory (q.v.)). This branch of geophysical research in addition to its academic interest may well have important economic consequences. It might for instance become possible to locate mineral deposits once accumulated under special conditions at certain latitudes but now drifted to other places. Salt and similar deposits formed by the continuous evaporation of solutions in hot countries are one example. Oil may well be another. There has been a steady change in rock magnetisation direction with geological time. It is now known with some accuracy that the most recent reversal took place 700,000 years ago. It has been found that the older the rock the farther removed is its fossil magnetisation from the present field. See F53(2).

Rococo an architectural style which was in effect the final stage of Baroque (q.v.). The name first came into use about 1830 to describe the period 1720-70 and means shell shaped (French *Pecanille*) since the shell was a favourite motif in Rococo ornamentation. About the beginning of the early 18th cent the heavy older type of Baroque began to show even less restraint than had characterized it in the past. It became still less utilitarian and showed a kind of playful lighthearted vitality which manifested itself in a wealth of ornamental invention. Baroque was flamboyant and robust Rococo frivolous. In architecture Rococo is naturally found in those areas where the Baroque had flourished, i.e. Munich, Prague, Vienna and Dresden. In painting the best expressions of Rococo are to be seen in the works of the French painter Watteau (d. 1721), Boucher (d. 1770) a favourite of Mme de Pompadour and famous as a decorator of boudoirs and Fragonard (d. 1806). (As in the case of Baroque it was typical of Rococo that the sculpture painting and the decorative arts of a building all expressed the same spirit.)

Roe popular name given to organs in fish which produce eggs and sperms. Hard roe is that of the female and consists of eggs that of the male is the soft roe or milt.

Roebuck a deer that was formerly common in the forests and parks of Britain, but is now only found at large in the northern parts of Scotland.

Roller a tropical Old World bird of the *Cuculidae* family related to the hoopoe, kingfisher and bee eater of strikingly brilliant blue chestnut greenish blue plumage. There are fifteen species one of which breeds in the far north and visits the British Isles on its migrations to and from its winter quarters in Africa.

Romanesque Architecture prevailed throughout Europe from the mid 10th to the 13th cent and implies an art which developed from that of the Romans. Notable in Romanesque style were the rounded arch and masonry vaulting. Romanesque led to the graceful and more complex Gothic (q.v.). The Italians never regarded Gothic highly and Romanesque churches generally based on the basilican plan (oblong with double colonnades and a semi circular apse at the end) continued to be built there until the beginning of the 16th cent. Some of the best examples can be seen at Pisa (11th cent.), Florence (San Miniato 1013), Lucca (12th cent.) and Milan (the 12th cent. San Ambrogio most famous of all). In Germany Romanesque architecture flourished longer than in France or England, the most famous churches are in the valley of the Rhine at Cologne (completely destroyed during the second world war), Mainz and Speyer. In France Romanesque churches are found in Burgundy, Provence and Normandy. For English Romanesque see Norman Architecture.

Roman Roads, highways constructed by the Romans. They were of great durability. The best known British roads were Ermine Street (London, Lincoln), York, Fosse Way (Lincoln

through Leicester, Cirencester, Bath, Exeter), Watling Street (London to Shropshire).

Romanticism, a term for a movement in the arts—whether in music, painting, sculpture or literature—which seeks to give expression to the artist's feelings about his subject, rather than to be concerned with form or reality. The romantic view is that art is nature seen through a temperament, the realist view is that art is a slice of life. In painting Delacroix (1798-1863) is the romantic artist par excellence with his uncontrolled expression of the passions and love of the exotic. In literature the Romantic movement reached its finest form in the works of Goethe, Schiller and Heine in the poetry of Byron, Keats, Wordsworth, Shelley and Blake and in the writings of Victor Hugo. Since Romanticism is partly a matter of temperament in the artist just as Classicism is, it may be found at all times and places although whether or not it becomes predominant depends on contemporary taste. Cubism for example with its attention to form is classical whereas Surrealism with its attention to content is romantic. See also Romantic Movement J45.

Roman Walls were built as frontier barriers under the Emperors Hadrian (76-138) and Antoninus Pius (86-161). Hadrian's wall, running from Tyne to Bowness on Solway, comprised a twenty foot stone wall, ditches, turret, milecastles, fortresses and a double earthen mound or vallum. Impressive ruins are still visible at Chesters and Housesteads. Antoninus Pius Hadrian's successor made a further advance but the turf wall which he built between Forth and Clyde was soon abandoned. Septimius Severus (143-211) restored Hadrian's wall after the assassination of Commodus and the subsequent civil wars. It was finally abandoned between 380 and 390.

Rood Screen an ornamental partition separating the choir from the nave in a church and supporting a crucifix or rood.

Rook a member of the crow family abounding in most parts of the British Isles and found in Europe, Asia and N. Africa. It has been introduced into New Zealand. Rooks usually nest in colonies in tall trees. They are highly intelligent birds and their ways have long been the subject of much careful study.

Rosary a circular chain of beads used by Catholics when reciting a particular form of sustained prayer. Each bead represents an entire prayer and the combined prayers constitute the Rosary.

Roses Wars of the (1455-85) between the rival houses of York and Lancaster for the possession of the English crown began in the reign of Henry VI and ended with the death of Richard III on Bosworth Field. The emblem or badge of the Lancastrians was the red rose and of the Yorkists the white rose. All rivalry between the Roses ended by the marriage of Henry VII the Lancastrian with the Princess Elizabeth daughter of Edward IV the Yorkist.

Rosetta Stone discovered in 1799 by the French at Rosetta in Egypt and deposited in the British Museum. It is a piece of black basalt about 3 ft. long and contains a decree of the Egyptian priests of Ptolemy V. Epiphanes (205-181 B.C.) in (1) hieroglyphics, (2) demotic and (3) Greek characters. It was by means of the three different inscriptions on the same stone that hieroglyphic writing was first able to be deciphered.

Rotten Row a corruption of *route de roi* (king's drive), the famous riding resort in Hyde Park.

Rouge et Noir a well known gambling card game played on a table divided into two sections and marked with two black and two red lozenges. Any number of players can take part and the money is staked on the red or black spaces. The cards are dealt out first to Noir until the pips aggregate more than 30, then in like manner to the Rouge and the packet coming nearest to 31 wins the stakes.

Roulette, a gambling game played on a table carrying a revolving wheel divided into 37 compartments. Each compartment bears a number 0 (zero) and 1 to 36. The numbers are mixed and do not follow any particular order. Of these 37 numbers 18 are black and 18 are red whereas zero is green. The players stake their money on any compartment colour or combination of numbers they please.

The wheel is whirled round and a ball is set rolling in the opposite direction dropping finally into one of the compartments thus deciding the winner, number and colour.

Roundhead In the reign of Charles I and later a Puritan or member of the Parliamentary party who wore his hair cut short. It was originally a term of derision applied by the Royalists who usually wore ringlets.

Round Towers high circular towers with conical roof and massive masonry walls built during the early Middle Ages (c. 10th cent.). It is believed that they served as refuge and lookouts. These buildings are numerous in Ireland and three remain in Scotland including that at Brechin which is attached to the church.

Royal Academy of Arts was founded in London in 1768 under the patronage of George III. The early exhibitions of the Academy were held first in Pall Mall and after in Somerset House where the exhibitions continued to be held until 1836 when the National Gallery being built the Academy moved its quarters to that building. In 1869 the present Royal Academy at Burlington House was opened. The Academy numbers 58 R.A.s and about 30 A.R.A.s. List of presidents: Sir Joshua Reynolds (1768), Benjamin West (1792), James Wyatt (1806), B. West (1806), Sir Thomas Lawrence (1820), Sir M. A. Shee (1830), Sir C. Eastlake (1850), Sir F. Grant (1860), Lord Leighton (1878), Sir J. E. Millais (1896), Sir E. J. Poynter (1896), Sir Aston Webb (1919), Sir F. Dicksee (1924), Sir William Llewellyn (1928), Sir E. Lyttons (1938), Sir A. J. Munnings (1944), Sir Gerald F. Kelly (1949), Sir A. E. Richardson (1954), Sir Charles Wheeler (1956) and Walter T. Monnington (1966). The Academy holds an exhibition of pictures, statuary and architectural designs every summer.

Royal Hospital Chelsea built by Wren was opened in 1694 as an institution for invalid soldiers.

Royal Institution established 1799 and incorporated by Royal Charter in 1800 for the promotion extension and diffusion of Science and of Useful Knowledge. It was in the building of the Institution that Faraday conducted his experiments. It supports four professors: natural philosophy, astronomy, chemistry and physiology. Famous also for its Christmas lectures designed for a juvenile audience.

Royal Society was founded in 1660 and incorporated by Royal Charter in 1662. Viscount Brouncker being named the first president. Its *Philosophical Transactions* date from 1665. Among those who served as president of the Royal Society are Sir Christopher Wren, Pepys, Sir Isaac Newton, Sir Joseph Banks, Sir Humphry Davy, Prof. T. H. Huxley, Lord Rayleigh, Sir Archibald Geikie, Sir J. J. Thomson, O.M., Prof. Sir C. S. Sherrington, O.M., G.B.E., Lord Rutherford, O.M., Sir William Henry Bragg, O.M., Sir Henry Dale, O.M., Sir Robert Robinson, O.M., Lord Adrian, O.M., Sir Cyril Hinshelwood, O.M., Lord Florey, O.M., Lord Blackett, O.M. (1965), Professor L. Hodgekin (1971).

Rubber produced from the juice of certain trees and shrubs of tropical countries is in such extensive demand now for tyres and other purposes that rubber plantations have been established in almost every part of the world where rubber can be grown, particularly in Malaysia and Indonesia. The best kinds come from the Amazon valley. In recent years great advances have been made in the production of synthetic rubber.

Rubicon, a small river falling into the Adriatic and forming one of the Italian boundaries the crossing of which anciently involved decisive action and constituted a declaration of war. Thus the phrase crossing the Rubicon denoting an act from which there is no withdrawal.

Rubidium a metallic element symbol Rb most closely resembling potassium. It is silver-white and very soft, and was discovered in 1861 by Bunsen and Kirchhoff using the spectroscope. It is rare occurring in small amounts in the mica called lepidolite and in potash salts of the Strassfurt deposits in Germany.

Rubrics are instructions in regard to the ceremonies of the Church, appearing in red in the Prayer Book.

Ruby is a deep red variety of Corundum (aluminium oxide) one of the most valued of precious stones. Burma yields some of the finest and rubies of inferior colour are found in Siam, Ceylon, South Africa and Brazil.

Rudd a fresh water fish of wide distribution plentiful in the river of Britain and common in most other parts of Europe also in Asia Minor. It is of a reddish gold colour with a greenish blue beard.

Ruff a bird related to the common sandpiper, at one time common in the Fen districts. The males have a ruff of feathers round the neck in the breeding season. The female is the Peewee.

Ruffe or Pöpe a small fresh water fish common in most parts of central Europe and similar in appearance to the ordinary perch. It is found in British rivers.

Rule Britannia! "the national sea song of England" was written by James Thomson (1700-45) the author of the Seasons and set to music by Dr. Arne about 1740. The poet's words were:

Britannia rule the waves! but it is usually rendered: Britannia rules the waves.

Rum an ardent spirit distilled from molasses and containing from 40 to 50 per cent of alcohol. It is chiefly manufactured in the West Indies and derives its special flavour from a volatile oil.

Ruminants animals that chew the cud being provided with a compartmented stomach enabling them to swallow food and later to bring it back to the mouth for mastication.

e.g. sheep, goats, oxen, etc. While in the rumen or storage compartment, some digestion of food especially cellulose takes place by bacterial action.

Runcible spoon a kind of fork used for pickles having three broad prongs. The word was used by Edward Lear about 1870 as a nonsense word and may be derived from *Runcivall* meaning large or huge from the horse said to have been dug up at *Roucesall* where Roland fell. Runcivall peas are the large peas called marrowfat.

Runes certain characters of an alphabet found in inscriptions in the Germanic languages discovered upon stone monuments and implements found in many parts of Europe including England. The runic alphabet originally had 24 letters. Scholars agree that some of the runes derive from Greek and others from Latin.

Ruskin College, the first residential college for working people founded at Oxford in 1899 by Mr. Walter Vrooman an American.

Rusts parasitic fungi some common species of which have reddish spores which in a mass have a rusty appearance. A well known species is the Wheat Rust (*Puccinia graminis*) which has an alternative host in the barberry.

Ruthenium a greyish white metallic element symbol Ru discovered by Claus in 1845. It is harder and more brittle than platinum in whose ores it occurs.

Rutile mineral titanium dioxide. It is found in many igneous rocks and in gemstones and schists. Its commonest colour is reddish brown.

S

Sabaoth a Hebrew word meaning an Army or host, and applied sometimes to the Supreme Being *e.g.* the Lord of Hosts (Rom. ix. 29).

Sabbath and Sunday Sunday or the Lord's Day is the first day of the week in the Christian year. It was substituted for the Jewish Sabbath in the 1st cent. A.D. as the Christian day of worship in commemoration of the Resurrection. The Sabbath in the Jewish system was the last day of the week (Saturday) in the Christian calendar designated as the day of religious rest in the fourth commandment of the Decalogue. It was the Puritans at the time of the Reformation who applied the term Sabbath to the Christian Sunday and the two terms have been used indiscriminately ever since.

Sabbatical Year was instituted by the Jews in ancient times for the purpose of giving the soil a rest from cultivation. This was every seventh year. In universities a sabbatical year is a year of absence from duty for the purpose of study and travel granted to professors at certain intervals.

Sable, a furred mammal of the weasel family.

mainly inhabiting Siberia. It is bright brown in colour and has a long bushy tail. American sable is a marten.

Saccharin, a white crystalline solid manufactured from toluene 550 times as sweet as cane sugar. It is used as a sweetening agent as a substitute for sugar when sugar is forbidden as in certain diseases or when there is a shortage. It has no value as a food.

Sack, the white dry wines of Spain and Madeira, canary being the most popular.

Safety Lamp was used in coal mines. It was invented by Sir Humphry Davy in 1816. The flame is enclosed in a cage of fine meshed wire which allows air to enter and promote burning but conducts away the heat generated in combustion so that no product of combustion escapes at a temperature high enough to ignite explosive gases in the mine.

Sage is a widely cultivated orange plant especially adapted for sheep. It is of strong leafy growth and bears bright red flowers. It belongs to the same family of flowering plants as peas and beans.

St. Elmo's Fire a glowing, brush-like discharge of electricity which takes place from sharp pointed objects on mountains or the masts of ships exposed to the intense electric fields of thunder clouds.

Saints' Days In the liturgy of the Roman Catholic church a saint is commemorated and his intercession sought on a special day (saint's day) usually the anniversary of his death. Pope Paul has decreed that from 1 January 1970 the following saints are to be dropped from the calendar: Christopher, Catherine of Alexandria, Alexis, Pudentia, Susanna, Margaret, Viviana, Luscacia, Martina, Veronika and Domitilla. Many others including our own Saint George and Nicholas (Santa Claus) have been demoted though they may be worshipped locally. There are now only 153 saints days in addition to those in honour of the Apostles, Saint Joseph and the Virgin Mary. The festival of All Saints is on 1 November.

Salamanders are amphibians superficially resembling lizards from which they differ in having a moist skin and no scales.

Salic Law was probably instituted in France in the 6th cent. for the purpose of excluding females from inheriting the Crown. The Bourbons introduced the same law into Spain but this was abolished by decree in 1830 to enable Isabella II to succeed.

Salmon, a familiar fish notable for its habit of ascending rivers from the sea in the autumn and there depositing its spawn not returning to the sea until the early spring. The salmon fishing season varies from place to place.

Saltpetre See Nitre.

Salvarsan the organic arsenical compound arsphenamine which Ehrlich discovered was able to kill inside the human body the spirochete germ that causes syphilis. Also known as 606. It has been superseded by neosalvarsan.

Salvation Army See J45.

Sanctuaries were places where offenders against the law were free from arrest and previous to 1697 when sanctuaries were suppressed several parts of London were treated as sanctuaries. The chief of these refuge localities was in Whitefriars. There were others in the Minories, Mitre Court, the Savoy, Westminster and the Mint. Other sanctuaries were at Beverley and at St. Buryan in Cornwall.

Sanderling, small wading bird of sandpiper family breeds in tundra regions of far north and is seen on sandy beaches of Britain as a winter visitor. Conspicuous white wing stripe and like Curlew. Sandpiper Knot, Dunlin and other members of sandpiper family have marked change of plumage between winter and summer.

Sandpiper, small to medium sized wading birds of several species whose migratory powers are so great that they are found in most parts of the world. They include the Common Sandpiper, a bird about 7 in. long, greenish brown head and back, white under parts, beak long and slender. Other species met with in Britain are the Green, Purple Wood and Curlew Sandpipers.

Sans-culottes (French = without knee breeches) a term applied by the French aristocrats to the revolutionary leaders during the French Revolution.

tion who wore long trousers instead of knee breeches.

Sanskrit is the language of ancient India spoken by the Brahmins and existing in early Oriental literature. It was the language of literature and government and is now confined to temples and places of learning. Its relationship to the modern Indian languages is rather like that of Latin and Greek to modern European languages. See also M45(1).

Saponin. The term is a generic one applied to a range of organic compounds which produce frothy soapy solutions. Saponins are extracted from the soapwort root, horse chestnut seeds etc. Saponin is the basis of the foam used for fire fighting. It can be used like soap to make insecticides and fungicides adhere to the leaves of plants. Also used as detergents.

Sapphic Verse a form of verse said to have been invented by Sappho, the lyric poetess of Lesbos who flourished about 600 B.C.

Sapphire, a valuable deep blue variety of Corundum (aluminium oxide) found mostly in India, Ceylon and Northern Italy. Synthetic sapphire is often used for gramophone stylus.

Saracen, the name given in classic times to the Arab tribes of Syria and adjacent territories. In the Middle Ages the current designation among the Christians for their Muslim enemies.

Sarcophagus, the name given to a stone coffin such as was used by the ancient Egyptians. Greeks and Romans for receiving the remains of their famous dead. These sarcophagi were often decorated with rich carvings and sculptures.

Sardonyx. See Onyx.

Sassanides were a dynasty of Persian rulers descended from Artaxerxes from 226 to 626.

Satellites are small planets revolving round the larger ones. The moon is the earth's only satellite. Jupiter has twelve. Saturn nine. Uranus five. Mars two and Neptune two. Of the 1750 objects in orbit round the earth in mid 1969, 371 were artificial earth satellites.

Satin-Bird, one of the bower birds of Australia. The male is silky blue back and the female greyish green. See Bower bird.

Satinwood, the timber of a tree plentiful in India and Ceylon and valued for cabinet work. It is of fine grain and very hard. Varieties also exist in the West Indies, Florida and Tasmania.

Satrap, the name given in ancient times to a Persian Governor of a Province.

Saturday, the seventh day of the week (the Jewish Sabbath) derived its name from Saturn or as some hold is called after the Saxon idol Saterne which was worshipped on this day.

Saturn, a planet the sixth from the sun from which it is distant about 886 millions of miles and around which it makes a revolution in about twenty nine and a half years. It is about 71,500 miles in mean diameter or nine times as large as the earth and rotates on its axis in ten and a quarter hours. It is surrounded by a series of rings composed of myriads of tiny satellites. It has nine small satellites. See F7.

Saturnalia, festivals held in ancient Rome in honour of the god Saturnus. They were made the scene of the most boisterous festivities and were continued for several days at the end of December.

Sawfish, a large marine ray found in tropical America and Guinea whose snout often attains the length of several feet and is provided with saw-like teeth. This 'saw' is swung from side to side among a shoal of fish which form the food of this ray.

Sawfly. These insects are considered to be the most primitive members of the order (Hymenoptera) to which the bees and wasps belong. In appearance they resemble somewhat the latter but there is no waist separating thorax and abdomen. The ovipositor is never used as a sting usually it is saw like so that the female can use it to make incisions into tissues of plants where the eggs are laid. The larvae look like caterpillars of butterflies and moths. One of the commonest species occurs on gooseberry bushes.

Saxons, a Teutonic race originally inhabiting what is now Holstein. By the 7th cent. they had, with the Angles and Jutes, conquered and colonised most of England.

Scald, the name of the Norse poets who were

similar to the birds of Wales. They had to celebrate the achievements of their warriors and leaders.

Scallop marine bivalve molluscs of the genus *Pecten* which is widely distributed. The scalloped edge to the shell results from a pattern of radiating grooves. Related to the oyster.

Scandium a metal element symbol Sc. It was discovered in 1879 by Nilson and occurs in small quantities in certain rarer minerals such as wolframite.

Scapular a vestment hanging from the shoulder to the knees worn by members of certain Roman Catholic orders. The name is also given to two small pieces of cloth worn over the shoulders by lay members of the Church in honour of the Virgin.

Scarabaeidae a family of beetles (Scarabs) widely distributed through Africa and Asia and the warmer parts of Europe. It is to this genus that the Sacred Beetle of the Egyptians belongs and numerous representations of it are found on ancient monuments.

Sceptre the staff or rod constituting the symbol of supreme authority. Parum the elder was the first Roman to assume the sceptre in 468 B.C. The French king, of the 5th cent. made a golden rod their sceptre.

Schism an ecclesiastical term for division in a church. The Great Schism was the separation of the Greek Church from the Latin finally established in 1054. The Western Schism was the division in the Roman Catholic Church from 1378 to 1417 when there were two lines of popes, one at Rome and one at Avignon which arose over the election of Urban VI and Clement VII to the papacy and was more a matter of persons and politics than a question of faith.

Schist the geological name of certain metamorphic rocks composed for the most part of minerals with thin plate like crystals (e.g. mica) so that the layers of a schist are closely parallel. Quartz occurs in schists and where it preponderates the term quartz schist is applied.

Scientific Units The International Bureau of Weights and Measures at Sèvres near Paris is the custodian of accurate scientific measurement in terms of internationally agreed units. Methods of measurement are continually being improved and measurements of new kinds coming into use. In defining units certain principles have evolved which can be expressed as a statement of priorities.

(i) units should be so defined that measurements made in one laboratory should be reproducible in another with as much consistency as possible.

(ii) units of all kinds should so far as practical form an interrelated system based on as few fundamental units as possible.

(iii) the fundamental units adopted should have a natural basis independent of particular man made objects such as metal bars or weights. An invariable universal natural standard was achieved for the metre in 1968 when it was defined in terms of the wavelength of a line in the spectrum of krypton-86. See S.I. Units.

Scholmen, the great scholastic philosophers of the Middle Ages who devoted themselves to the study and exposition of questions of religious inquiry and attempted to reconcile the teaching of the Church with that of Aristotle. The chief Scholmen were Archbishop Anselm, Albertus Magnus, Thomas Aquinas, Peter Lombard, Duns Scotus. See also J48.

Scorpion, the scorpions constitute an order of the arthropods. Distinctive features are the pair of powerful claws at the head and a sting at the tail, which curves over the back in attack or defence so that it points forwards. The poison injected by the sting is potent causing instant death in spiders centipedes etc. and acute discomfort to humans. The idea that a cornered scorpion can sting itself to death is a myth. Scorpions are immune to their own poison.

Scorpion Fly The scorpion fly of which there are less than 500 species constitute a separate order of insects the *Mecoptera*. They have 2 pairs of membranous wings and gain their popular

name because in some species the end of the abdomen is turned up though it does not function as a sting.

Scree or **Talus** the mass of loose angular rock fragments which accumulate towards the bottom of hill sides and mountain sides. These fragments have been detached by weathering processes in particular frost action.

Seythians nomadic conquerors and killed horse men of ancient times (9th-3rd cent. B.C.) who inhabited much of Southern Europe and Arctic Russia.

Sea Anemones or **Actinaria** an order of marine animals of the coelenterate class *Anthozoa*. They form a large and varied group of about 1100 species and occur in many beautiful colours flower like in form.

Sea Butterfly marine molluscs which propel themselves by two wings or side expansions of the foot. They constitute the order called *Pteropoda*.

Sea Cow See Manatee.

Sea Cucumbers or **Holothurians**. These animals constitute the class of echinoderms called *Holo huroidea*. They are elongated and worm like with a ring of about twenty tentacles round the mouth. There are about 500 species.

Sea Eagle a genus of flesh eating birds related to the true eagles kites and other birds of prey. Examples are the Bald Eagle emblem of the U.S.A. White tailed Eagle (Grey Sea Eagle) and Steller's Sea Eagle of the Pacific coast of Asia. Last known in Britain in 1911.

Sea Elephant or **Elephant Seal** a curious genus of seal the males of which possess a proboscis a foot or more in length that suggests an elephant's trunk. They are found on the coast of California and in certain parts of the Southern Ocean their blubber has a commercial value.

Sea Gravimeter a new instrument to determine the density of the earth's crust beneath the oceans of the world. Designed by Dr. A. Graf of Munich and Dr. J. Lamar Worzel of Columbia University. It can detect changes of one millionth of the value of gravity at the earth's surface and is being used in the oceanographical research programme of the I.G.Y.

Sea Hare a genus of molluscs (*Aplysia*) so called because of resemblance to a crouching hare. The shell is thin curved plate largely sunk in the animal's body. They have four tentacles occur in Britain in the laminaria or ribbon wrack zone and discharge a purple fluid when molested.

Sea Horse, a sea fish (*Hippocampus*) very numerous in the tropics and comprising some twenty species. Their bodies are ringed and they have prehensile tails. Their heads are horse shaped and they swim in a vertical position.

Sea Lily A class of echinoderms, the sea lilies may be roughly described as stalked star fishes. There are about 400 living species and several thousand extinct species are known. Otherwise called *Crinoids*.

Sea Mouse a genus of marine worms called *Aphrodite* oval in shape, 8 or 9 in long, iridescent covered with fine bristles.

Sea Squirts or **Tunicates**. These animals are placed in the sub phylum called *Urochordata* found growing in rounded jelly like masses on rocks near low water level. They get their name through the water jets they discharge.

Sea Urchin species forming the class *Echinoidea*. The body is globular and covered with spines which may be used for both defence and locomotion. The main organs of locomotion are however the tube feet as in starfishes. Much has been learnt of recent years by marine biologists from experiments with the purple sea-urchin *Arbacia*.

Seasons comprise the four natural divisions of the year and are due to the inclinations of the earth's axis to the plane of the elliptic. See Section N.

Secondary Sexual Characters. Characters of animals which are distinctive of sex but have no direct connection with the reproductive process. Examples are the mane of the lion and the antlers of some deer.

Secretary Bird, so called because of the quill like plumes about its ears is a bird of prey related to the eagles and vultures common in Africa and

of considerable service as an exterminator of snakes. It is a large bird about 4 ft in height.

Sedimentary Rocks See F8(2)

Seismology the branch of geophysics devoted to the study of earthquakes and other earth movements. The instruments used for the registration of earth tremors are termed seismographs and consist in principle of a pendulum system the supporting framework following the ground movement and the bob remaining at rest thus setting up a relative movement between two parts. In order to record the displacements completely at one station three seismographs are necessary to show the two horizontal and the vertical components of the motion. Apart from detection and study of waves from earthquakes sensitive seismographs are now widely used in geophysical prospecting particularly in the search for possible oilfields.

Selenium a non metallic element. Symbol Se related to sulphur. It is a dark red colour and solid found associated with sulphur iron pyrites etc though only in small quantities. It is a semiconductor (η) and its special electrical properties have led to its use in photo electric cells and rectifiers. Selenium is widely used in the chemical industry as a catalyst (η) in producing aromatic hydrocarbons from less useful hydrocarbons. Also used in making some types of glass.

Semiconductors substances with numerous special and useful electrical properties a few of which are

(i) they conduct electricity much better than do insulators but much less well than metals (hence their name)

(ii) their power to conduct depends strongly on their temperature—which makes them useful for temperature sensitive devices

(iii) they are sensitive to light—hence their use in photoelectric cells and solar batteries

(iv) when in contact with metals or with other suitable semiconductors they form a boundary layer which conducts electricity much better one way than the other—this is the basis of many rectifiers some of which called crystal diodes are an important component in radios and electronic devices

(v) their electrical properties can be greatly influenced by putting in minute amounts of impurity this enables semiconductor devices especially transistors to be made with care fully selected properties

Semiconductors were known to Faraday but the semiconductor age really arrived with the invention of the transistor (η) in 1947. The ubiquitous transistor is only one of very many semiconductor devices which perform a variety of functions in technical apparatus of all kinds. Semiconductors used in technology are usually small crystals frequently of germanium or silicon and their robustness and small power consumption often make them superior to other devices such as thermionic valves which they often replace. Other semiconductor materials are cadmium sulphide selenium lead telluride indium antimonide. See also F10

Senate, the higher governing Assembly of a Legislature. The word applied primarily to the Roman council is also used to denote the upper chamber in the legislatures of France the United States and other countries. In certain universities the governing body is also called the Senate.

Sensitive Plant A species of Mimosa (*Mimosa pudica*) whose leaves are extremely sensitive to touch shaking and burning.

Sepia the ink of the cuttlefish. See Ink Sac. **September** the ninth month of the year and the seventh of the old Roman calendar hence the name from Septimus. The designation was several times changed by the Emperors but none of the new names survived for long.

Septuagesima Sunday the third Sunday before Lent. **Septuagint** the Greek translation of the Old Testament made by Alexandrian Jews between 250 B.C. and 100 B.C. from Hebrew texts now lost. There are many differences between the Septuagint and the Massoretic version (A.D. 900) and

therefore it is of great value for textual criticism.

The symbol for the Septuagint is LXX.

Seris the name given to the slaves formerly existing in Russia who answered to the condition of the feudal villeins of England. They were attached to the soil and were transferred with it in all sales or leases. Serdica existed in Prussia until 1807 and in Russia until 1861.

Serpentine a mineral chemically a hydrous silicate of magnesium. Green serpentine is used as an ornament stone. Fibrous serpentine is called asbestos.

Serval a small carnivorous animal of the lynx order with black spots on a tawny ground. It is numerous in Africa preys upon the smaller animals of the deer family and is sometimes styled the Tiger Cat.

Set both in everyday speech (as in tea set chess set) and in mathematics (a set is a collection of things). The members of the set can be specified by listing them or by describing the properties necessary for membership of the set e.g. the set of ginger haired boxers. Set theory is a very important branch of mathematics founded by a great mathematician (Georg Cantor (1845-1918)). Its development has influenced many other branches of mathematics. Perhaps one reflection of its fundamental nature is to be found in the fact that many schoolchildren even of tender age are now learning set theory and confounding parents who did not hear of it at school twenty years ago.

Settlement Act of 1701 assigned the Crown to the House of Hanover in case of Anne's death without children. The decision represented the determination of the squires and the Anglican Church never again to trust themselves to a Roman Catholic king.

Seven Champions of Christendom as set forth in medieval literature were St. George of England St. Andrew of Scotland St. Patrick of Ireland St. David of Wales St. James of Spain St. Denis of France and St. Anthony of Italy. **Seven Churches of Asia** referred to in the Revelation of St. John were those of Ephesus founded by St. Paul in 57 Smyrna Pergamos Thyatira Sardis Philadelphia (Lydia) and Laodicea (Phrygia) all in W. Asia Minor.

Seven Wonders of the World were 1 the Pyramids of Egypt 2 the tomb of Mausolus King of Caria (hence the word mausoleum) 3 the Temple of Diana at Ephesus 4 the Walls and Hanging Gardens of Babylon 5 the Colossus at Rhodes 6 the Ivory and Gold Statue of Jupiter Olympus and 7 the Pharos or Watch Tower built at Alexandria by Ptolemy Philadelphus King of Egypt.

Seven Years' War was waged by Frederick the Great and England against Austria France and Russia from 1756 to 1763. It resulted in the cession of Silesia to Prussia of Canada to England and in the strengthening of our Indian Empire.

Sexagesima Sunday is the 2nd Sunday before Lent.

Sextant an instrument which has superseded the quadrant as a measurer of angles between distant objects. It is of special importance in navigation and surveying and contains 60 degrees described on a graduated arc. A small telescope is attached and there are also a couple of mirrors which reflect the distant objects so as to enable them to be accurately observed. The invention is attributed to John Hadley and to Thomas Godfrey independently about 1730. Even today it is still the best instrument for telling where you are at sea.

Shad a marine fish belonging to the same genus as the herring. It is found along the Atlantic Coast of the U.S.A. and ascends rivers to spawn.

Shagreen shark's skin also untanned leather of peculiar grain made from skins of wild asses camels and horses.

Shalloon a kind of cloth manufactured from wool and worsted and used chiefly for women's dresses and coat linings. It gets its name from the fact that it was originally made at Chalons. **Shamrock** the three-leaved clover-like plant native to Ireland and its national emblem.

Shark a large and powerful ocean fish comprising many species very widely distributed but most numerous in tropical seas. They have formidable teeth and are the most carnivorous of all fishes. They usually attain a large size the

whale-shark, being often of a length of 50 ft. Commercially the shark yields shagreen from its skin, the fins are made into gelatine and an oil is obtained from the liver.

Sheep a well known family of ruminants of great utility as wool producers and for food. From the earliest times sheep have been a source of wealth to England. So much were they valued in the 10th and 16th cent. that their exportation was frequently prohibited. Sheep are classified under the following (1) long wools and (2) short wools and (3) mountain breeds. Most of the longwools carry Leicester blood in their ancestry and the shortwooled Down breeds carry the blood of the Southdown. The Southdown produced the present Suffolk one of the most popular breeds. Cheviot is an important mountain breed. Of the foreign breeds the most valued are the Merino sheep of Spain which yield a fine long wool. Australia, U.S.S.R., Argentina, India, U.S.A., New Zealand and S. Africa are the chief wool producing countries in the world.

Shelduck, a handsome genus of surface feeding ducks, one of which the common shelduck is an inhabitant of this country. It is a beautiful white and chestnut plumaged bird with dark green head and neck and red bill. Another species the ruddy sheldrake appears in Britain only occasionally.

Shellac This resin is the secretion of the lac insect (*Coccus lacca*) which occurs in forests of Assam and Siam. It is used for making varnish and in the manufacture of gramophone records. See also Lac.

Sherardizing Process for coating steel or iron parts with zinc to prevent corrosion. This is done by heating the parts in a closed rotating drum containing zinc dust.

Shilling has been an English coin from Saxon times but it was not of the value of 12 pence until after the Conquest. It is interchangeable with the 5 new pence decimal piece which came into circulation in 1968.

Ships have existed from prehistoric times. There is mention of one that sailed from Egypt to Greece in 1485 B.C. and in 786 B.C. the Tyrians built a double decked vessel. No double decked ship was known in England however before the *Royal Harry* was built by Henry VII. and it was not until the 17th cent. that ship building was carried on in this country as a prominent industry.

Ship-worm. See Teredo.

Shoddy the name given to a kind of cloth mainly composed of woollen or worsted rags torn up and re-fabricated by powerful machinery. It was first made at Batley in Yorkshire about 1813 and became a very important industry employing many thousands of people at Batley and the neighbouring town of Dewsbury.

Shot, the name given to solid projectiles fired from guns. In the time of Henry V stone shot was used, later leaden shot then iron shot and finally steel shot introduced by Sir Joseph Whitworth.

Shrike, a large and varied family of birds of hawk like behaviour found in all continents except S. America. The Red backed Shrike which winters in Africa is a breeding visitor to England and Wales. It is commonly called the

Butcher Bird from the way it impales its prey (small birds and insects) on thorn twigs. The other species on the British list are the Great Grey Shrike, the Lesser Grey Shrike, the Woodchat Shrike, and the Masked Shrike.

Shrove Tuesday the day before the first day of Lent receiving its name from the old custom of shroving or making confession on that day.

In England the day has always been associated with the making of pancakes.

Sicilian Vespers, the term applied to the terrible massacre of French people in Sicily in 1282. The French under Charles of Anjou were then in occupation of the island and had been guilty of many cruelties. It began at Palermo on Easter Monday at the hour of vespers and resulted in the expulsion of the French king and the introduction of Spanish rule.

Silence, Tower of, or *dakhna* a tower about 25 ft. high, built by the Parsees for their dead. The corpse is taken inside by professional corpse-bearers and left to be consumed by vultures.

Parsees do not burn or bury their dead and the *dakhna* is to protect the living and the elements from defilement.

Silhouette, a form of black profile portrait invented by Etienne de Silhouette in 1750 and formed by an outline cutting made with scissors or other sharp instrument from cloth paper or other flat substance.

Silicon an important non metallic element symbol Si. It is related to carbon. Next to oxygen it is the most abundant constituent of the earth's crust (27% by weight). It occurs in many rocks and its oxide occurs in many forms (e.g. quartz, sand, flint, agate, chalcedony, opal etc.). Coming into use as a semi-conducting material for making transistors and similar devices.

Silicones are synthetic organic derivatives of silicon which because of their high resistance to heat and moisture have special uses e.g. lubricants, heat resistant resins and lacquers and water repellent finishes. Silicones are compounds in which the molecules consist of chains of atoms of silicon and oxygen alternately. Silicones were developed in the United States from discoveries first made by Prof. F. S. Kipping at Nottingham University. Manufacture began in Britain in 1950 and in the form of fluids, resins, rubbers and greases they find wide use in industry. The largest plant in Europe is in Glamorgan.

Silk the name given to a soft glossy fabric manufactured from the fine thread produced by the silkworm. It was known to and highly prized by the ancients being at one time paid for weight for weight with gold. The manufacture of silk was carried on in Sicily in the 12th cent. later spreading to Italy, Spain and the south of France. It was not manufactured in England before 1604 but when certain French refugees established themselves at Spitalfields in 1688 the industry was developed and became of importance. In the 18th cent. the Lombers of Derby achieved great success in this industry. Japan, China, Italy, Korea and the Soviet Union are the chief silk producing countries.

Silkworm the larva of a species of moth *Bombyx mori*. It is native to China and has been cultivated with success in India, Persia, Turkey and Italy. The silkworm of commerce feeds on mulberry leaves and produces a cocoon of silk varying in colour from white to orange. The cocoon is the silken habitation constructed by the worm for its entrance upon the pupal condition and to obtain the silk the pupa is killed by immersion in hot water.

Sill a sheet like mass of igneous rock which has been intruded parallel with the stratification of the country rock, of a dyke.

Silurian This geological period is one of the major subdivisions of the Palaeozoic era. Its beginning is estimated at 440 million years ago and the period lasted about 40 million years. Maximum thickness of the Silurian strata in Britain measures 15 000 ft. See F44.

Silver, a white precious metal symbol Ag (Latin *argentum*) found in a free state also in certain combinations and in a variety of ores. The chief silver producing regions are the Andes and Cordilleras, Peru, Bolivia and Mexico have yielded vast supplies of the metal since the 16th century and Colorado and Nevada in the United States have also been very prolific in silver yield. In England standard silver (that used for coinage) formerly contained 92½ per cent fine silver and 7½ per cent alloy but when the price rose to 80½d. per oz. and the coins became worth more than face value the Coinage Act of 1920 was passed reducing the fineness to half. To provide silver bullion for industry and for a fund towards the redemption of our silver debt to America it was decided in 1946 to replace the United Kingdom silver coinage by one made of cupro nickel (75 per cent copper, 25 per cent nickel). Maundy money however is of the original silver standard. Silver chloride and bromide are light sensitive compounds and are used in photography.

Simony, the offence of trading in church offices has been contrary to English law since the time of Edward VI. Elizabeth also promulgated laws against simony. In 1879 a Royal Commission reported on the law and existing

practice as to the sale, exchange and resignation of benefices. The position is now controlled by the Benefices Act 1933, the Amendment Measure 1923 and the Benefices Rules 1926.

Sinn Féin (*Irish* = ourselves alone) Irish nationalist movement founded in 1905 which developed into a mass republican party and triumphed in the establishment of the Irish Free State. A small extremist group has survived which represents politically the outlawed I.R.A.

Sins, The Seven Deadly or Capital Sins are pride, avarice, lust, anger, gluttony, envy, sloth.

Sirius, the dog star, so called because of its situation in the mouth of the Dog (Canis Major); it is the brightest of all the fixed stars and is also one of the nearest to us.

Sirocco, a warm southerly often dust-laden wind blowing across Mediterranean land from the Sahara in advance of an eastward moving depression over the Mediterranean.

Siskin, a small bird of the finch family common in Northern regions nesting in Britain. The common Siskin has a yellow-green colour and is a lively swift-flying bird with a stout bill.

Sistine Chapel, the chapel of the Pope in the Vatican, renowned for its frescoes by Michelangelo.

SI Units (Système International d'Unités) form an internationally recognised system of metric units for scientific and technical quantities. The basic units of length, time, mass, electric current, temperature and luminous intensity are respectively the metre, second, kilogramme, ampere, kelvin (see Absolute Temperature) and candela. The SI was recommended for general adoption by a number of international organisations such as the General Conference on Weights and Measures (1960). Many countries have made or are making the SI the only legally recognised set of units. Gt. Britain's intention to go metric will bring widespread use of SI units in its train. These units command the widespread though not absolutely unanimous support of industrialists, technologists and scientists. Many have urged that their adoption will be a triumph of common sense and end the confusing multiplicity of units on the world scene. See Section N.

Six Articles, The Statute of the 1539 for compelling adhesion to the chief doctrines of the Roman Catholic faith, transubstantiation, communion in one kind only, or the laity, vows of chastity, celibacy of the clergy, private masses and auricular confession, those who refused to subscribe to the Articles were treated as heretics. The Act was repealed in 1547.

Skate, a genus of sea fishes related to the Rays.

Skink, The skinks constitute a large family of lizards with large smooth scales under each of which is a bony plate. The largest species found in Australia is about 2 ft long. Some skinks have adopted a burrowing habit and degeneration of the limbs is associated with this. The Common Skink is a small species about 5 in. long living in the deserts of N. Africa.

Skua, falcon-like marine birds related to the gulls, found throughout the world. Known as

Robber Birds because they steal not only the young and eggs of other birds (including penguins) but also their food, which they force them to disgorge in mid air. The Arctic Skua breeds as far south as Scotland. The Great Skua breeds in both Antarctica and Arctic. Other species are the Pomarine Long-tailed and McCormick's Skua.

Skunk, a North American mammal of the weasel family with short legs and long bushy tail. All fifteen species are black and white, some being striped and the rest spotted. It secretes and ejects at will a foul-smelling fluid.

Sky, The blue colour of the sky on a summer day is the result of the scattering of light waves by particles of dust and vapour in the earth's atmosphere. Blue light having almost the smallest wavelength in the visible spectrum (0.0004 cm.) is scattered laterally about 10 times as much as the red (0.0007 cm.).

Skyscraper, Owing to lack of ground space, increasing cost of land, and growth of modern cities, buildings are being made higher than broader, hence the name. The structures are constructed of a steel framework usually clothed in concrete or reinforced concrete. Among the highest New York skyscrapers are the Empire

State Building (102 stories, 1,950 ft.), Chrysler (77 stories, 1,046 ft.), the Rockefeller Center (70 stories, 950 ft.) and the World Trade Center (1,350 ft.) due for completion 1972. The tallest building in Britain is the 580 ft. Post Office radio tower (basic diameter 52 ft.) near Tottenham Court Road. London. Japan's first skyscraper is the Kasumigaseki building (36 stories) in Tokyo.

Slate, fine grained clayey rocks which have undergone metamorphism. They cleave easily and it is this property of cleavage which makes them a valuable source of roofing material. Important quarries producing mainly green slate are in the Coniston-Ambleside area of the Lake District.

Slavery, In its earlier forms as in the times of ancient Greece and Rome in the feudal ages when vassalage and villenage existed and in the serfdom of Russia and other northern nations, slavery was attended by many inhumanities and evils but perhaps in the negro slavery system which prevailed in the British colonies for upwards of 200 years and in certain parts of the United States up to 1861, it attained its highest point of cruelty. In 1883 the Act of Emancipation was passed emancipating all slaves in British territories though slavery continued to be tolerated in northern Nigeria, Sierra Leone and in the Anglo-Egyptian Sudan long after that date. Even today slavery and forced labour are still prevalent in some parts of the world.

Slide Rule, an instrument which consists of two logarithmic scales sliding alongside each other. By its use multiplication, division, extraction of roots, etc. are specially carried out.

Slith, a curious family of mammals only found in Central and South America. They dwell almost entirely in the trees, proceeding from branch to branch with their bodies hanging downwards, their weight being supported by their large hook-like claws. They eat foliage.

Slow Worm, a species of lizard found in Britain which lacks legs. Silver with longitudinal brown stripes. It lives almost entirely on slugs.

Smelting, The process of heating an ore with a reducing agent to convert ore into metal and with a flux to convert rocky impurities into a slag that will float on top of the molten metal. Slag and metal can then be tapped separately. An example is iron smelting, the reducing agent is coke, and limestone is added as the flux. The smelting is carried out in a blast furnace.

Snake, The snakes constitute the important reptilian order *Ophidia*. Snakes have a scaly cylindrical limbless body, lidless eyes, forked tongue and the upper and lower jaws joined by an elastic ligament. Their locomotion is accomplished by means of the excessive mobility of their numerous ribs. All snakes have teeth used for seizing prey and the poisonous varieties are furnished with poison fangs in the upper jaw. These fangs are hollow, modified teeth and the venom passes into them from a special gland situated behind the angle of the mouth. Some 2,500 species of snakes are known, divided into 13 families. There are 8 British species—the grass-snake, smooth snake and adder.

Snipe, a wading bird, long-legged with long slender straight bill, brown plumage and zig-zag flight. The Common Snipe breeds locally throughout Britain. The Great Snipe and small Jack Snipe are occasional visitors. The close season is Feb. 1 to Aug. 11.

Snow, When water vapour condenses at high levels at a temperature below freezing, a cloud of ice particles is formed. If these frozen droplets are small they fall slowly and gradually assume a feathery crystalline structure, reaching the earth as snowflakes if the temperature remains below freezing.

Socialism, See J47.

Soda, carbonate of sodium is now mainly obtained by certain processes of manufacture from common salt. It was formerly obtained from the ashes of plants. Bicarbonate of sodium is the primary product in the Solvay or Ammonia soda method for commercial manufacture of soda. It is also formed when carbon dioxide is passed into strong soda solution. The bicarbonate is used in medicine and in the preparation of baking powder.

Sodium a metallic element symbol *Na* (Latin *Natrium*) first obtained by Sir Humphry Davy in 1807 from caustic soda by means of the electric battery. Its chloride is common salt, the deposits of salt (e.g. in Cheshire and at Stassfurt) have come into existence through the drying up of inland seas. Salt occurs in sea water to the extent of about 3 per cent. The Dead Sea contains about 22 per cent. The blood of animals is maintained at a level of about 0.6% sodium chloride. That there is sodium in the sun's atmosphere was confirmed in 1869 by Kirchhoff from his spectroscopic observations. Liquid sodium metal has properties which make it suitable as a coolant in some nuclear reactors. A technique of handling this very reactive liquid has had to be developed.

Solar Battery one of the innumerable devices made possible by the development of emf conducting materials notably germanium and silicon. This device creates an electric current from light falling on it. The current can be put to use or stored in storage batteries. The energy of the current is derived from the sunlight and the solar battery is thus an energy converting apparatus. Solar batteries have provided power for the instruments in satellites. In London in 1960 a car (developed in the U.S.A.) was demonstrated running on the power from sunlight and solar batteries.

Solar Wind a continuous stream of electrically charged particles blowing outwards from the sun supplemented from time to time by intense outbursts from particular regions of the sun's surface. These streams of protons and electrons on encountering the earth's magnetic field distort it and cause magnetic storms and aurorae.

Soldering is a means of joining together two pieces of material usually metals by melting a third metal (the solder) into the joint. The solder solidifies in the pores of the other metals and holds them together. The materials to be joined are not themselves melted so the technique requires less heat than welding. Solders are alloys, there are many kinds depending on the materials to be joined and the strength of joint desired. See *Welding*.

Solstice an astronomical term indicating the point at which the sun is most distant from the equator. See *Seasons*, Section N.

Soundings at sea, to determine depth at any point have been taken in all seas and with considerable accuracy. A deep reading was that of the *Challenger* expedition in 1878 near St. Thomas in the North Atlantic when 3 875 fathoms were sounded. In 1851 H.M.S. *Challenger* recorded the then maximum ocean depth in the Marianas Trench (W. Pacific) by echo sounding as between 5,882 and 5,940 fathoms. Another deep was located in the S. Pacific in 1952-53 of 5 514 fathoms in the Tonga Trench 180 miles S. of Tonga Tabu. Since then even greater depths have been recorded in the Marianas Trench and the Mindanao Deep. See *Pacific Ocean*.

Southern Cross popular name of *Crux* a constellation of the Southern hemisphere consisting of four bright stars in the form of a Latin cross. It has been called the pole star of the south and is indispensable to seafarers.

South Sea Bubble, the name given to a series of financial projects which began with the formation of the South Sea Company in 1711 and ended nine years later in disaster after a mania of speculation. The idea behind the parent scheme was that the state should sell certain trading monopolies in the South seas in return for a sum of money to pay off the National Debt (which stood at £51 800 000 in 1719 when the scheme started). The idea fascinated the public fabulous profits being dreamt of and the price of the stock rose out of all proportion to the earnings of the Company. Many dishonest speculative ventures sprang up in imitation with the inevitable result that thousands were ruined. All classes had joined in the gamble and a Committee of Secrecy set up by the House of Commons in Dec 1720 to investigate the affairs of the Company proved that there had been fraud and corruption on a large scale in the affairs of the Company. Sir Robert Walpole who had been an opponent of the scheme from the outset dealt with the crisis

Space Flight The Soviet Union was the first country to launch a man into space and bring him safely back to earth. This epoch making event took place on April 12 1961 when Yuri Gagarin tragically killed in an air crash in 1968 orbited the earth in a spaceship weighing about 42 tons. It was launched by rocket in an elliptical orbit with greatest height 187 miles and least 109 miles. The inclination of the orbit to the equator was 65 deg 4 min and the period of revolution was 89 min 6 sec. Since then the Russian *Vostok* cosmonauts Titov (17 orbits) Nikolayev (64 orbits) Popovich (48 orbits) Bykovsky (81 orbits) Terechko, the first woman space traveller (48 orbits) the *Vostok* cosmonauts Komarov Feoktistov and Yegorov (16 orbits) Belyaev and Leonov (17 orbits) the American *Mercury* astronauts Glenn (3 orbits) Carpenter (3 orbits) Schirra (6 orbits) Cooper (22 orbits) the *Gemini* astronauts Grissom and Young (3 orbits) McDivitt and White (6 orbits) Cooper and Conrad (120 orbits) Borman and Lovell (200 orbits) Schirra and Armstrong (15 orbits) Armstrong and Scott (9.6 orbits) St. John and Cernan (44 orbits) Young and Collins (43 orbits) Conrad and Gordon (44 orbits) Lovell and Aldrin (60 orbits) were among the first to complete successful missions in space. Leonov was the first to perform the extra vehicular (EVA) experiment (1965) i.e. to leave an orbiting spaceship and float freely in space. Russia was the first to achieve an automatic docking (link up) between two unmanned spacecraft in orbital flight (Oct 1967) and of two manned spacecraft (Jan 1969). The American *Apollo* mission was accomplished when Armstrong and Aldrin became the first men to set foot on the moon. This milestone in manned space flight took place on July 20 1969. See also *Sputniks*.

Space Research By space research we mean scientific research work which can only be carried out otherwise inaccessible observing locations by rocket propulsion. Such propulsion does not rely on the presence of an atmosphere to provide oxygen so that it is capable in principle of conveying objects to unlimited distances. The subject of space research is therefore one which is concerned with scientific applications in various fields of a single highly specialised and powerful technique. It is not a single discipline but can provide data of great importance for many such as the physics of the earth the sun moon and other bodies of the solar system astronomy geodesy and the study of gravitation. The prospect of investigating the biological conditions on different planets such as Mars and Venus is also opened as well as that of experimental biological studies under conditions of zero gravity. Although the results of many aspects of space research are vital for those concerned with the practical realisation of manned travel in space space research is largely a branch of pure science independent of any applications which may stem from it. The major technical problems involved in space research are

- (a) Launching of the instrument containing vehicle with the necessary velocity
- (b) Guidance and control of the vehicle so it pursues the desired path
- (c) Tracking the vehicle to determine its actual path and the position on the path at any time
- (d) Transmission of the data recorded by the instruments back to the earth
- (e) Satisfactory operation of scientific instruments in the environment within the vehicle
- (f) Provision of adequate power supplies to operate the equipment within the vehicle for sufficiently long periods

It is important to distinguish three distinct types of vehicle—the vertical sounding rocket the artificial earth satellite and the deep space probe. The track of a vertical sounding rocket is mainly vertical and the whole path to the highest point and back is traversed in a few minutes only. An earth satellite circulates in an orbit round the earth in the same way as does our natural satellite the moon. If it approaches

the earth at any point within 100 miles of the surface the air resistance causes the path to spiral in so rapidly that the vehicle is eventually burnt up by air friction within the dense atmosphere after an orbital life of a few months only. It follows that artificial satellite vehicles are only useful as instrument containers if the distance of closest approach (the perigee distance) is not much less than 100 miles. For the study of the properties of the atmosphere at lower altitudes down to the limit (20 miles) attainable by balloons vertical sounding rockets must be used. It is a great advantage for work at higher altitudes to use satellites as it is then possible to make systematic observations for months at a time from a great number of positions relative to the earth. The successful space flights achieved by manned satellites also suggest that it should not be long before manned observatories become practicable. Deep space probes include vehicles which pass out to great distances from the earth and may leave the neighbourhood of the earth for ever to become artificial planets. Such probes may pass close to or soft land on the moon or planets or may merely pursue paths well out into interplanetary space.

Spanish Civil War 1936 to 1939 The war commenced by a revolt by the Fascist General Franco against the Republic which had succeeded the Monarchy in 1931. Germany and Italy aided the rebels who besieged Madrid for over 2 years. An International Brigade was formed to help the Republic but the Spanish Government was faced by the greater part of the Army and very effective assistance from Italy and Germany. These powers seized the opportunity to have a curtain raised to the world conflict which they intended to precipitate. After a total loss of a million men the Fascists overpowered the Republic.

Sparrow name given to finch like birds found in most parts of the world of which the House Sparrow *Passer domesticus* is the most familiar of British birds. Also native to Britain is the rural Tree Sparrow distinguished from the male House Sparrow by its chestnut crown. Other European species are the Italian Spanish and Rock Sparrows.

Specific Gravity defined as the ratio of the mass of a particular volume of a substance to the mass of an equal volume of water at 4 °C. See Hydrometer.

Spectroscopy Newton's arrangement with the prism was the first spectroscope. Its function was to separate out the colour components of a source of light. Two hundred years elapsed before this apparatus was developed into a precise scientific instrument capable of measuring both the wavelength and intensity of each colour component. In this form it is called a spectrometer. All atoms and molecules have well defined characteristic spectra which can be used to recognise them. In order to produce emission spectra it is necessary to excite the material under investigation by some means such as by heating in a flame. The resulting radiation then consists largely of sharp bright lines characteristic of the material. Absorption spectra are produced by interposing the experimental material between a white light source and the spectrometer. Then dark lines are seen corresponding to absorptions of energy in exactly the same places as the bright lines are observed in the emission spectra. Spectroscopic techniques have now been developed to such an extent that accurate measurements of wavelength and intensity are possible not only in the visible region, but over almost the whole of the electromagnetic spectrum. Not only does spectroscopy play an important rôle in probing the structure of matter but it can be applied in the field of astronomy. The use of radio wave spectroscopy has led to the discovery of several new types of stellar object and this data is now producing a complete reappraisal of our understanding of the universe.

Sphinx, in Greek mythology a winged creature with a woman's head and a lion's body. The sphinx of ancient Egypt represented the pharaoh in a divine form.

Spiritualism. See J47.

Spirituals negro melodies with religious inspiration

and which are still spontaneously created, but have also passed into art music.

Sponge. See Porifera, F33(1).

Spoonbill a long legged marsh bird closely related to the ibis and stork, remarkable for its snow white plumage and broad, flat spoon shaped bill. The European species has not been bred in England since the beginning of the 17th cent. but is still a regular summer visitor from Holland where it nests in colonies in reed beds and islets.

Sputniks the name of the Russian earth satellites first launched during the period of the International Geophysical Year. *Sputnik I* launched 4 Oct. 1957 became the first man made earth satellite. *Sputnik II* launched a month later carried a dog as passenger. *Sputnik III* launched in May 1958 and weighing well over 2 tons became the first fully equipped laboratory to operate in space. The father of space travel with rockets was a Russian—Konstantin Eduardovich Tsiolkovsky—the centenary of whose birth practically coincided with the launching of the first earth satellite.

Squirting Cucumber *Echallium elaeagnum* so named from the fact that when ripe it breaks from the stalk and ejects its seeds and juice from the hole made by the beetle.

Stainless Steel The development of stainless steel for cutlery manufacture etc. began with the discovery of Harry Brearley in 1912 that steel containing 12 per cent of chromium is rust proof.

Stalactites are deposits of calcium carbonate formed on the roofs and sides of limestone caves and in tunnels, under bridges and other places where the carbonic acid of rain water percolates through and partly dissolves the limestone resulting in the growth of icicle like forms that often assume groupings. The water that drops from these may deposit further calcium carbonate which accumulates and hardens into a series of sharp mounds or hillocks called stalagmites.

Starch is an organic compound occurring in granules in nearly all green plants and especially in the seeds of dicotyledonous and cereal plants, potatoes etc. In its pure form starch is a tasteless odourless white powder and is a carbohydrate consisting of carbon, hydrogen, and oxygen.

Star Chamber an ancient tribunal of State in existence in 1487 and possibly earlier, charged with the duty of trying offences against the Government unfettered by the ordinary rules of law. It was in effect a Privy Council entrusted with judicial functions. Under Charles I the Star Chamber was used by the King and his party to persecute opponents and in 1641 a Bill carried in both Houses abolished it.

Starling (*Sturnus vulgaris*) a well known European bird now common in many parts of the world. It has handsome iridescent blackish plumage and nests in holes and crevices. Flocks of starlings are often seen wheeling in the air, thousands roost on buildings in the heart of London. Other European species are the Spotted and Rose coloured starlings. The latter sometimes wanders to the British Isles.

States General, national assembly in which the chief estates of the realm were represented as separate bodies. The name though not the institution, has survived in the Netherlands where the two houses of parliament are known as states general. In France the states general consisted of three orders: clergy, nobility and commons. Philip IV first summoned it in 1302 to support him in his quarrel with Pope Boniface VIII. While absolute monarchy was establishing itself it met rarely and not at all from 1614 until 1789 when it was convoked as a last resort by Louis XVI. But when it met it declared itself the National Assembly which marked the beginning of the revolution.

Statistics is a science that deals with the collection of numerical facts and the evaluation of their significance. The word is also used to refer to the facts themselves as in trade statistics. This important science gives precise meanings to words like 'average' and to statements like 'this set of data is significantly different from that'. In a world in which more and more information is becoming available in numerical form (I.Q.s, examination results, tax

yield—health records road accidents etc.) the proper—as opposed to the misleading—use of statistics cannot be over emphasised. Many young people can now study statistics at school and college, and governments and industries employ many statisticians. *See Average*

Statute of Westminster 1931 An Act of parliament which gave a basis of equality to the British Dominion. The Dominions as well as the Unit d Kingdom were defined by the Balfour Memorandum of 1926 as 'autonomous communities within the British Empire equal in status in no way subordinate one to another in any aspect of their domestic or external affairs though united by a common allegiance to the Crown and freely associated as members of the British Commonwealth of Nations. The Statute was the request. The Dominions are sovereign States governed solely by their own Parliaments and Governments. *See also K189*

Steam Engine a machine whereby steam becomes the active agent of the working of machinery and of very wide application. The leading types of steam engine are (a) condensing or low pressure engines where the steam is generated by a boiler (b) non condensing in which the cylinder exhausts its steam into the open air. Engines of the latter type are used where portable engines are required.

Steam Hammer invented by the Scottish engineer James Nasmyth (1808-90) in 1839 which proved of great utility in the development of the iron trade. The hammer itself which is fixed to the end of a piston rod passing through the bottom of an inverted cylinder often weighs as much as 80 or 100 tons and is so perfectly controlled by the steam power that its action can be so accurately gauged that it could be made to crack the glass of a watch without actually breaking it, or brought down upon a mass of molten iron with a force representative, many hundreds of tons.

Stearin is the portion of fatty matters and oils which remains solid at an ordinary temperature and is a compound of stearic acid with glycerine. It is largely used in the manufacture of candles. With caustic soda stearin forms a soap (sodium stearate) which is present in most commercial soaps which contain sodium palmitate and oleate in addition.

Steel an alloy of iron and carbon with varying proportions of other minerals. The famous blades of Damascus and steels of Toledo were made by the cementation and crucible method. The metal produced by the Bessemer process (qv) is of the highest value for structural purposes rails etc. In recent years the technique known as continuous casting has been developed which bypasses some major steps in the conventional process of steel making. *See also Stainless Steel.*

Stereophonic Broadcasting A person having normal hearing is able to determine the direction from which a sound reaches him by virtue of the fact that he has two ears and therefore the sound will reach one of them a fraction of a second before it reaches the other. This difference in arrival time allows the brain to calculate direction. It will therefore be apparent that if the same person listens to say an orchestral concert in a large hall he will be able to determine—even with his eyes shut—the approximate position of a particular instrument with respect to the rest of the orchestra. If however he listens at home to a broadcast of the same concert then due to the fact that he hears the music after it has been picked up by a single microphone located at one point and radiated over a single-channel transmission system he will be unable to allocate a definite position to any instrument. The aim of stereophonic broadcasting or sound reproduction therefore is to restore the listener's ability to locate the position in space of the various sources of sound and to follow movement. To do this it is necessary to use two microphones in the studio—to simulate the two human ears—and to transmit their outputs, through two similar but separate chains of equipment to two radio receivers and their two loudspeakers, which must be placed some distance apart in the listener's home. *See also F 64(2)*

Stereotype, a metal cast taken from movable type

which has been set up in the ordinary way. The first to introduce the process in practical form in this country was William Ged of Edinburgh who made stereotype plates in 1780. An impression of the type matter is first taken by means of a mould of prepared plaster of Paris or moistened sheets or specially prepared paper and when molten stereo metal is poured upon the mould and allowed to cool and harden the stereo plate is formed and can be printed from as a solid block for some time.

Steroids A class of structurally related compounds based on a system of condensed rings of carbon and hydrogen which are widely distributed in animals and plants. Included in the steroid family are sterols found in all animal cells vitamin D sex hormones bile acids and cortisone a drug used in the treatment of rheumatic fever.

Stibnite the chief ore of antimony chemically it is antimony sulphide. Steely grey in colour. **Stickleback** a family of small spiny finned fish widely distributed in both fresh and salt water. Male constructs roofed nest held together by sticky secretion from glands near kidneys. Several females deposit eggs therein which are jealously guarded until after young are hatched.

Stirrup a loop of metal U shaped strap suspended from the sides of the saddle used for mounting and to support the horseman's foot. Some authorities allege their use as far back as the early Iron Age and it is generally believed that they were used in battle in A.D. 378 when the Gothic cavalry defeated the legionsaries of the Emperor Valens at Adrianople. Stirrups relieved the tension on the rider's knees and so enabled him to be armed from top to toe.

Stoat a slender carnivorous mammal with short legs related to the weasels. The stoat is distinguished from the latter by its longer tail which has a black tip. The black tip is retained even in the winter when the animal turns white the fur then being known as ermine. It is found in northern latitudes and is abundant in Arctic America.

Stoma (pl stomata) microscopic pores on the surfaces of leaves through which gaseous exchanges take place and water is lost. It has been estimated that a single maize plant bears 200 million stomata usually closed at night.

Stone Flies comprise the order of insects called *Plecoptera* which includes some 700 species of which about thirty occur in Britain. The wings are membranous and two long thread like feelers protrude at the tail end. The larvae are aquatic.

Stonehenge, a remarkable collection of Bronze Age monuments arranged in two circles 340 ft in diameter standing on Salisbury Plain Wiltshire. Modern archaeological research dates origin back to between 1800 and 1500 B.C. There is some evidence to suggest that the monument may have been built for astronomical purposes providing a method of keeping a calendar for predicting the seasons and foretelling eclipses of sun and moon. *See also J18(1)*

Stork a family of heron like birds with long bills freely distributed over Europe Asia Africa and S America. The White Stork is an occasional visitor to England and more rarely the Black Stork, these are the only two European storks.

Stratosphere a layer of the earth's atmosphere which begins 6-7 miles above the earth. The attraction of the stratosphere as a medium for air travel rests upon the absence of storms indeed weather phenomena as commonly understood do not occur there being no vertical temperature gradient in the stratosphere and no convection currents.

Stratum (pl strata) a bed or layer of rock.

Strontium. This silver white metallic element was discovered by Hope and Klaproth in 1793 and isolated by Sir Humphry Davy in 1808. The chief strontium minerals are celestite (sulphate) and strontianite (carbonate). Compounds of strontium give a brilliant colour to fireworks and signal flares. Radioactive isotopes of strontium (strontium 90) are formed as fission products in nuclear explosions and tend to collect in bone on account of the chemical similarity of strontium and calcium (qv). This genetic hazard is a cause of great alarm. *See Fall-out*

Sturgeon, a large fish found in northern seas and

rnivers with five rows of bony plates along the back and sides and pointed mouth with four barbels. Caviare is prepared from sturgeon ova. The rights of the Crown to certain wild creatures including sturgeon caught off the coasts of Britain and held since the time of Edward II were abolished in 1970.

Sublimation, when a solid substance is heated and turns into vapour without passing through the liquid stage and then condenses as a solid on a cold surface it is said to sublime and the process is called sublimation. Iodine behaves in this way and sublimation is used as a method of purifying it.

Submarine the first submarine the *Nautilus* was designed by Robert Fulton and tried out in the river Seine and in the sea off Brest in 1801. The idea was too revolutionary to find acceptance and it was not until electricity for under water propulsion became available that the submarine underwent extensive development. Britain became interested about 1900 and the Germans developed it and made it into an instrument of warfare. The first voyage under the North Pole was made in 1958 by the American nuclear powered submarine *Nautilus* (q.v.). The Royal Navy's nuclear submarine fleet includes 4 *Polaris* vessels—*HMS Resolution* which became operational in 1968, *Renova* (1969), *Repulse* (1969), *Revenge* (1970) each armed with 16 missiles with nuclear warheads and 6 nuclear powered fleet submarines including *Dreadnought*, *Valiant*, *Warspite*, *Churchill* and *Conqueror*. A further 3 fleet submarines were under construction in 1971.

Subpoena (L = under a penalty) a writ commanding a witness to appear before a court of law.

Suez Canal, connecting the Mediterranean and the Red Sea, was built by the French engineer Ferdinand de Lesseps and opened in 1869. An Egyptian company *Canal Maritime de Suez* was formed in 1886 with a capital of 200 million francs. The British Government acquired 178 602 shares out of a total of 400 000 for £4 million (value Mar 31 1966 £28 982 544). Its length is 101 statute miles minimum width 195 ft 10 in. (navigation channel). Under the Convention of 1888 all nations were granted freedom of navigation without discrimination in peace or war. The right was recognised by Egypt in the Anglo-Egyptian Agreement of 1954 under which Britain agreed to give up the Suez base. The Suez Canal Company was nationalised by the Egyptian Government with out warning on July 28 1956 since when it has been widened and deepened and the average time of transit reduced. The Canal has been barred to Israeli ships since the creation of the state of Israel in 1948 and to all shipping since the Middle East war of 1967.

Suffragette member of the Women's Suffrage Movement who in the early part of this century agitated to obtain the parliamentary vote. The movement ended in 1918 when women of 30 were given the vote. In 1928 a Bill was passed which granted equal suffrage to men and women. The leaders of the Women's Suffrage Movement were Mrs. Pankhurst and her two daughters, Sylvia and Dame Christabel. Mrs. Fawcett, Nellie Kenny and others.

Sugar to the chemist the term is a generic one covering a group of carbohydrates including cane sugar (sucrose), glucose, fructose and maltose. In ordinary parlance sugar means sucrose which is obtained from the sugar cane, sugar beet or sugar maple.

Sulphur, an elementary brittle crystalline solid, symbol S, abounding in the vicinity of volcanoes. It is yellow in colour. It occurs in combination with other elements as sulphates and sulphides and allied with oxygen, hydrogen, chlorine, etc., is of great commercial utility. Used in its pure state it constitutes the inflammable element in gunpowder. It is also used for matches and for making sulphuric acid.

Sulphuric Acid, a compound of great commercial importance used in a variety of manufactures, and composed of sulphur, oxygen, and hydrogen. Extremely corrosive.

Sun, one of the millions of stars in the universe, the centre of the solar system, estimated to be distant from the earth 98 004 000 miles to have a diameter of 865 000 miles and a volume

S (80th Ed.)

a million times that of the earth. It rotates on its axis from east to west, though not as a solid, the solar equator turning once in about 25½ days and the poles in about 34 days. Large spots are observed on the sun—varying in size from 30 000 miles in diameter—which form and disappear at irregular intervals. The area of the disc covered by the spots however reaches a maximum roughly every 11 years when the sun's heat seems rather greater than usual and magnetic storms more frequent (sunspot cycle). Spectrum analysis shows that the sun is composed of many elements found in the earth. Its surface temperature is about 6 000 °C. Observations made in 1964-65 (Year of the Quiet Sun) complemented those obtained during the International Geophysical Year 1957-58 when the sun was remarkably active. The earth is in the outer atmosphere of the sun and subject to its winds and storms. The apparently inexhaustible heat of the sun which has maintained life on the earth for millions of years is derived from the destruction of matter involved in the transmutation of hydrogen nuclei into helium nuclei, in which process about four million tons of matter is destroyed every second. At this rate of conversion the sun will go on radiating for 30 000 million years. The Soviet space rocket *Lunik 1* fired on 2 Jan 1959 became the first artificial planet of the sun. See also F7.

Superconductor a metal in a state in which its electrical resistance has entirely vanished so that electric currents can flow indefinitely without generating heat or decreasing in strength. The superconducting state of metals was first discovered in mercury by Onnes in Leiden in 1911. There are many magnetic and thermal properties associated with superconductivity and the phenomenon as a whole has proved to be of great scientific interest. It resisted explanation till about 1957. In the meantime many metals and alloys were found to show the property but only at very low temperatures—below $c = 260^{\circ}\text{C}$. There is a growing number of practical applications of c coils of superconducting wire (kept very cold by liquid helium) can be made to carry enough electric current to produce strong magnetic fields. Such fields are very constant and do not require the large supply of electrical power that ordinary electromagnets need.

Supersonic Speed, a speed greater than the speed of sound (in air at sea-level sound waves travel at about 760 m p.h.). When a body travels at a speed which is greater than the speed at which disturbances themselves can travel a Mach number exists for the generation of waves of enhanced intensity. Thus aircraft travelling at supersonic speeds produce shock waves in the air somewhat analogous to the bow waves of fast moving ships. These shock waves are regions of intensely disturbed air which produce the sonic boom effect so distressing to people living near supersonic routes. *Supersonic* is not to be confused with *ultrasonic* (q.v.).

Surface Tension. The surfaces of fluids behave in some respects as though they were covered by a stretched elastic membrane. This property is called surface tension. The action of detergents may be attributed in part to a reduction in the surface tension of water allowing it to wet the surface of dirty articles.

Surrealism. The aim of the Surrealist school of painting and sculpture is to overcome the barriers between conscious and unconscious mind, the real and unreal worlds of waking and dreaming. As such it has a long and respectable ancestry although the term was not in use until 1922 when it was picked by André Breton from Guillaume Apollinaire who had used it in connection with certain works by Chagall. However Bosch in the 15th cent., Fuseli and Goya in the 18th and many other purveyors of the weird and fantastic were the forerunners of modern Surrealism. The modern movement has broadly speaking taken two different directions: the first was towards complete fantasy and absurdity which took the form of "found objects" e.g. a bird-cage filled with sugar-cubes and a thermometer, a bottle-dryer, a bicycle wheel, or abstract works with strange and apparently irrelevant titles such as Paul Klee's *Twisting*

Machine the second towards highly detailed and realistic paintings of objects placed in strange juxtapositions—e.g. Salvador Dalí's trees with limp watches drooping over their branches or Giorgio de Chirico's deserted and classical looking streets with long arched perspectives and a lone statue or a bunch of bananas in the foreground. On the whole Surrealism has spent its initial force and become almost respectable. Its idea of strange juxtapositions now widely commercialised finds a place in advertisement illustrations and in the more sophisticated forms of window-dressing.

Surtax, an additional duty of income tax, chargeable on total income in excess of £2 500 (after deduction of certain allowances). The starting level on *earned* income is £5 000 or more depending on personal allowances. Payable on Jan. 1 following year of assessment so that surtax for 1971-2 is payable on Jan. 1 1973. The net sum is charged on a sliding scale. In April 1973 the present income tax and surtax system will be replaced by a single graduated personal tax. This will have a basic rate with a supplementary rate for higher incomes and will be less discriminatory against investment income. See *Income Tax* also G48(2).

Swans large graceful birds which together with the ducks and geese form the family Anatidae. There are three European species with white plumage: the Mute Swan distinguished by its orange bill with black knob (less prominent in female); a familiar sight on the rivers and ornamental lakes of this country. Two wild swans are winter visitors here: the Whooper and Bewick's Swan. The new (female) and old (male) mate for life and the young swans are called cygnets.

Swan-upping The annual marking of the Thames swans which takes place during the third week of July. This ancient ceremony dates back to the 15th cent. when all the Thames swans were declared to be Royal birds owned by the Crown. Two city guilds—the Vintners' and Dyers' Companies—own one third of the 600 swans now on the Thames. This privilege was granted to them by King Edward IV in return for money grants. Vintners' birds are marked with a nick on each side of the bill; the Dyers' with a nick on the right side only. The Queen's birds are unmarked.

Sweet Potato This plant (*Ipomoea batatas*) which is a climbing perennial belonging to the convolvulus family has thick roots that are rich in starch and are eaten like potatoes. A native of the W. Indies and Central America, new varieties of sweet potato have been bred which stand cooler climates and can be grown as far north as Cape Cod. The sweet potato of New Zealand is called the Kumara.

Swift, a bird so-called from the extreme speed of its flight resembling a swallow but related to the hummingbird. It has long scythe-like wings, sooty black plumage and greyish white chin. There are several species inhabiting most parts of the world, particularly the tropics. The British breeding bird is among the latest to return from Africa and the earliest to go. Swifts are the only birds to use saliva for their nests. One oriental species builds its nest entirely from saliva.

Sword, weapon used in personal combat; originally made of bronze. The Romans introduced the iron sword 20 in. long. During the Middle Ages the most famous blades were those made by the Arabs at Damascus and those made at Toledo.

Symbiosis. When two organisms live together and both derive mutual benefit from the association the partnership is known as symbiosis. An example is the symbiosis of an alga and a fungus in lichens; another is the ordinary pea plant and the bacteria which live in the nodules on the pea's roots.

Synapse is the point of association between one nerve cell and another. The nervous impulse travelling along one nerve has to be transmitted to the next across a minute gap. This is the synaptic gap. The mode of transmission is electrical. The impulse arriving at the synapse releases a chemical transmitter which diffuses across the gap and stimulates an impulse in the adjacent nerve cell.

Syndicalism See J49

Synoptic Charts These are meteorological charts used in forecasting on which weather conditions at a network of stations at a standard hour of observation, are recorded using symbols of the international weather code. Surface weather maps have been drawn regularly for more than a hundred years and the modern advance is the drawing of other maps showing conditions in the upper air.

Synoptists The writers of the first three Gospels whose narratives in the main agree though Matthew and Luke add material not found in Mark (written first) all three differ from John's Gospel.

T

Tabard a cloak or outer garment worn in mediaeval days by the peasantry. The name was also applied to a garment worn by knights over their armour.

Tailor-Bird name of a small group of warblers familiar in India and China and remarkable for their habit of sewing leaves together to enclose their nests. The bill is used as needle; vegetable fibre as thread and a knot is tied to prevent it slipping.

Taj Mahal, the white marble mausoleum built at Agra by Shah Jehan in memory of his favourite wife who died in 1629. Over 20 000 men were occupied for over twenty years in its erection.

Takahe or **Notornis** large New Zealand bird of the rail family which for many years was believed to be extinct. Small colony found in 1948 in remote valley of mountainous part of the S. Island. The bird is strictly nocturnal.

Take-over Bid describes an offer made to all the shareholders of a company to purchase their shares at a named price and conditional upon acceptance by the holders of a named proportion of the total share issue. If accepted the purchaser thus gains control of the company.

Tallage in Norman times were taxes levied by the Crown upon lands of the royal demesnes. The levying of tallage was taken away by a statute of 1840 which required the consent of Parliament for all direct taxes.

Tally Office, in the Exchequer was the department of the Government in which tallies were kept representing the acknowledgment of moneys paid or lent. In 1834 the Houses of Parliament were burnt down through the overheating of a stove with discarded Exchequer tallies.

Tambourine a light small, single-headed drum with loose metal discs left into the side of the hoop so that they tinkle when the tambourine is shaken. An older name for it is the timbrel.

Tammany, a New York democratic organisation sprang out of an old benevolent society named after an Indian chief and has exerted a powerful influence over political movements in New York. The leaders of the organisation have used their power when their party has been successful at the polls to appoint their nominees to every prominent office and have exacted bribes for concessions and privileges and generally Tammany rule has meant wholesale corruption. Of this there is ample evidence in the disclosures of the Tweed and other Tam many frauds and in the fact that the Boss usually contrived to make himself wealthy.

Tannins are chemical substances obtained from a variety of plants and trees from oak bark, and from galls. They are used in the leather trade in the tanning process making the skins resistant to decay.

Tantalum a scarce bluish metallic element symbol Ta discovered by Ekeberg in 1802. Chemically related to vanadium and niobium, it is usually associated with the latter in nature. For several purposes it can be used in place of platinum, and it finds application in the making of surgical instruments. Tantalum is very hard and resistant to acids (other than hydrofluoric acid) it is used in alloys.

Taciturn See J49

Tapestry a fabric largely used in former times for wall decoration and hangings. It was known to the ancient Greeks but in its modern form came into prominence in the 16th and 17th cent. when it was manufactured in a marked degree.

of excellence by the weavers of Flanders especially those of Arras. The manufacture was introduced into England early in the 17th cent. and was attended by considerable success. At the present day the term is applied to worsted cloths for furniture coverings and there are also various kinds of tapestry carpets now made. The most famous tapestries of olden times were the Aubusson Tapestry and the Savonnerie. The Gobelins Tapestry factory originated in Paris in the reign of Francis I. is still a national establishment. See also Bayeux Tapestry.

Tapirs The tapirs constitute a family close to the horse family and the rhinoceros in the Ungulate order. They have four toes on the front feet and three on the hind. The snout is drawn out into a short trunk. The largest tapir is the Malayan tapir which stands 3½ ft at the shoulder. Four species occur in Central and S America.

Tar is a dark viscid product obtained from the destructive distillation of wood, coal, peat etc. Wood tar is acid owing to the presence of acetic acid (pyroigneous acid). The highest proportion of coal tar goes into road making. Distillation of coal tar yields many valuable compounds including benzene, phenol (carbolic acid), naphthalene and cresolite, the final residue after distillation is pitch. Based on the chemical manipulation of compounds from coal tar is the preparation of many perfumes, food essences, drugs, antiseptics and plastics.

Tarantula the name given to a large range of big hairy spiders. Music was supposed to cure their sting, hence the Tarantella dance.

Tarpeian Rock at Rome received its name from the tradition that Tarpeia, the daughter of the Governor of the Citadel who betrayed the fortress to the Sabines was crushed to death by their shields and buried beneath the rock. From this height persons guilty of treason were hurled to death.

Tartaric Acid is prepared from tartar (potassium hydrogen tartrate) deposited in wine vats during fermentation. Cream of tartar is purified potassium hydrogen tartrate which is incorporated in baking powder. Tartaric acid is also used in the manufacture of effervescent salts.

Tate Gallery named after its founder Sir Henry Tate at Millbank, S.W. was opened in 1897. Sir Henry Tate bore the cost of the building (£80,000) and also contributed the nucleus of the present collection. The Turner Wing, the gift of Sir Joseph Duveen was added in 1910. The collection is thoroughly representative of British art and has been extended several times to include modern foreign art.

Tay Bridge spans the Tay at Dundee, opened for rail traffic on 20 June 1887. A previous bridge completed in 1877 was blown down on 28 Dec 1879 as a train was passing over it. A new bridge was opened on 18 August 1906 for road traffic 7,356 ft in length the longest road bridge in Britain.

Tea was introduced into England about the middle of the 17th cent. when it was a great luxury and fetched from £8 to £10 a pound. It is an Asiatic plant, native properly to China, Japan and India. Up to about 1885 most of the tea imported into this country came from China, the bulk now comes from India and Ceylon.

Teal the smallest of the European ducks and next to the Mallard the commonest British species. It is a handsome bird and a very swift flier but not as swift as the Garganey or Summer Teal.

Te Deum, the song of praise (Te Deum laudamus). We praise Thee O God. It is supposed to have been the composition of St. Ambrose in the 4th cent. and is used in Roman Catholic and English Church services.

Telecommunications The sending of messages over a distance. The term is generally applied to the sending of messages by telegraph, telephone, radio, television or radar. The first submarine telegraph cable between England and France was laid in 1850 and, following Hertz's investigations into electric waves, Marconi's invention led to Britain being linked with Europe by wireless telegraphy in 1899. The first permanently successful telegraph cable across the Atlantic was laid in 1866. The first telephone service between London and Paris was opened in 1891. The electro magnetic telephone was

invented by Alexander Graham Bell a Scottish born American in 1876. The first submarine telephone cable to span the Atlantic was laid in 1956 connecting Britain with Canada and the United States and many submarine telephone cables have since been laid including the Commonwealth cable system completed in 1967. The spectacular advances in space research depended on the new tools of work provided by parallel developments in telecommunications e.g. long range radio and television transmission electronic computer control. The performance of *Telstar* in July 1962 and of *Early Bird* in April 1965 showed that intercontinental communication by satellites in space is practical. See also Radar, Radio, Television.

Telemetry measurement at remote distances by means of a radio link from the object (missile or satellite) to the ground. The third Russian sputnik for instance carried apparatus for measuring among other things the pressure and composition of the atmosphere and the intensity of different kinds of radiation from the sun. Its radio transmitter powered by solar-energy batteries sent out the information in coded form by means of unmodulated signals at 20,005 megacycles with a duration of 150-200 mill seconds. Radio telemetry from inside the body is being increasingly used in medical and biological research. miniature radio transmitters can be swallowed or implanted in man or animal to detect various physiological conditions.

Telepathy and Clairvoyance See J50.

Teleprinter a telegraph transmitter with a type writer keyboard by which characters of a message are transmitted electrically in combinations of 5 units being recorded similarly by the receiving instrument which then translates the matter mechanically into printed characters. The telex or public teleprinter service provides direct person-to-person transmission of written messages.

Telescope an optical instrument for viewing objects at a distance the astronomer's intelligent. Lippershey is credited with construction of the first in 1608. Galileo constructed several from 1609 and Newton was the first to construct a reflecting telescope. The ordinary telescope consists of an object glass and an eyepiece with two intermediates to bring the object into an erect position. A lens brings it near to us, and the magnifier enlarges it for inspection. A refracting telescope gathers the rays together near the eye-piece and is necessarily limited as to size but the reflecting telescope collects the rays on a larger mirror and these are thrown back to the eye piece. The world's largest reflectors are at Mount Palomar Observatory, California (200 in.), Mount Wilson Observatory, California (100 in.), the McDonald Observatory at Mount Locke, Texas (82 in.) and the Victoria BC Observatory (72 in.). At the Royal Observatory formerly at Greenwich, now at Herstmonceux, Sussex, a 98 in. *Isaac Newton* telescope has been installed. The *Hale* 200 in. telescope at Mount Palomar is the largest ever made and has revealed objects never before photographed. It is able to probe space and photograph remote galaxies out to a limiting distance of 2,000 million light years. The *Schmidt* telescope at Mount Palomar has been used to make a huge photographic map of the universe. The giant steerable radio telescope built by Manchester University at Jodrell Park, Cheshire has a 250 ft reflector with a beam width of 12 minutes of arc. Early in its career it tracked the Russian earth satellites and the American lunar probes. Another instrument of radio astronomy is the interferometer which consists of two spaced aerials. See also Observatories.

Television, or the transmission of images of moving objects by radio. To understand the problems of television it is necessary to consider the action of the human eye. Basically the eye consists of a lens which projects an image of the scene before it upon the retina, a light-sensitive screen at the back of the eye. The retina is made up of several millions of tiny light sensitive elements each quite separate and distinct from its neighbours and each separately connected to the brain by an individual fibre in

the optic nerve. Thus the eye is a very complex organ, and it is able to pick out numbers of tiny details from a scene and convey each detail separately and simultaneously to the brain. It does not send a blend of different points of light and shade in the same way that the ear sends a blend of different sounds. If it did the brain would receive a completely unintelligible blur. From this it is clear that a television system which transmitted a mixture of detail would be useless. It must transmit all the details in a scene separately yet almost simultaneously, and re-assemble them at such a speed that the eye cannot observe the building up process. A means of doing this was provided by Nipkow in 1884 when he invented his famous scanning disc and later Weiller invented the mirror drum for the same purpose. Such mechanical devices as these held the field for many years and in 1925 Baird in this country and Jenkins in America were both using them for the experiments which in 1925 led to the successful transmission of shadows and simple outlines. It is not until 1929 however that the first practical demonstration of television as we understand it took place when Baird transmitted by radio moving pictures of living human faces over a short distance. The B.B.C. began television broadcasts in 1930 the I.T.A. in 1955. The first television exchange across the Atlantic was made in July 1962 by way of the *Telesat* satellite.

Tellurium a relatively scarce element symbol *Te* discovered in 1782 by Becherstein. Chemically it behaves rather like sulphur its salts are known as tellurides. It occurs chiefly combined with metals in ores of gold, silver, copper and lead. It is a semiconductor and some of its compounds (also semiconductors) are coming into use in technical devices.

Templars were soldier knights organised in the 12th cent. for the purpose of protecting pilgrims in their journeys to and from Jerusalem and obtaining for them from having had granted to them by Baldwin II, a temple for their accommodation. At first they were non-military and wore neither crests nor helmets but a long wide mantle and a red cross on the left shoulder. They were established in England about 1180. During the crusades they rendered valuable service, showing great bravery and devotion. In the 12th cent. they founded numerous religious houses in various parts of Europe and became possessed of considerable wealth. It was this that caused their downfall. Kings and Popes alike grew jealous of their influence and they were subjected to much persecution, and Pope Clement V abolished the Order in 1312. Edward II in 1308 seized all the property of the English Templars. The English possessions of the Order were transferred to the Hospitallers of St. John, afterwards called the Knights of Malta. *See also* Hospitallers, Knights, Teutonic Order.

Temple a building dedicated to the worship of a deity or deities. Those built by the ancient Greeks at Olympia, Athens, and Delphi were the most famous. The Temple of Diana at Ephesus was another. The Temple of Solomon at Jerusalem was destroyed and rebuilt several times. Herod's Temple was destroyed by the Romans in A.D. 70.

Temple Bar, an historic gateway that until 1879 stood at the western entrance to Fleet Street near the bottom of Chancery Lane. In olden times it was the custom to impale the heads of traitors over this gateway. It has been at Theobald's Park, Chesham, since 1889.

Tellurium, an element, symbol *Tl* discovered in 1842 by Mosander belonging to the group of rare-earth metals.

Teredo, the scientific name of the ship worm, a peculiar bivalve mollusc, which lodges itself when young at the bottoms of wooden ships and bores its way towards causing much injury.

Termites, also known as *White Ants* though they are not related to the true ants and are placed in an entirely different insect order (*Isopoda*). They abound in the tropics and also occur in temperate countries, though only two species are common in Europe. There is no British species. They live in colonies and their nests take the form of mounds of earth and

wood cemented together with saliva and up to 20 ft. in height. Five separate castes are recognised three of them being capable of reproduction and the other two are sterile.

Tern. This slender ruf-like bird has long pointed wings a deeply forked tail, pale grey and white plumage black cap and is a very graceful flier. There are several species some of which are summer migrants to Britain. The Arctic tern winters in the Antarctic returning to find a nesting place in the spring.

Terrapin a kind of fresh water tortoise. There are several species widely distributed in the Northern Hemisphere.

Tertiary Rocks, in geology the rocks formed during the Cenozoic era comprising the Eocene, Oligocene, Miocene and Pliocene periods. *See* P44.

Teutonic Order of German military knights was founded in the Holy Land at the end of the 12th cent. for succouring the wounded of the Christian army before Acre. They were dispersed in the 15th cent. but the Order continued to exist until 1809 when Napoleon I confiscated its properties. In 1840 the order was reconstituted in Austria as a semi-religious knight-hood. *See also* Hospitallers, Knights, Templars.

Thallium a blue grey metallic element symbol *Tl* discovered by Crookes in 1861. It is obtained from the fume dust resulting from the burning of pyrites for sulphuric acid manufacture.

Thanksgiving Day a national holiday in the United States observed since 1864 on the last Thursday in November instituted by the Pilgrim Fathers in 1621 to celebrate their first successful harvest.

Theodolite. The instrument used by surveyors for measuring angles in the horizontal and vertical planes also used in meteorology for following balloons to measure the speed and direction of wind.

Therm. The charges for gas for lighting and heating (formerly reckoned at per cubic foot) are now based on the calorific or heat value of the gas and the unit used is termed a therm. The therm is 100,000 British thermal units.

Thermionic Emission is the departure of charged particles from matter under the influence of heat. The higher the temperature the greater the flow of escaping particles. The most common example is the emission of electrons from red hot electrodes—this is the basic phenomenon made use of in thermionic valves (*see* Valve). If the hot electrode (the cathode) is enclosed in an evacuated or gas filled bulb, the emitted electrons can be collected at another electrode (the anode) and will flow through an external circuit back to the emitter. Thus an electric current has been generated by heat.

Thermodynamics a term first applied by Joule to designate that branch of physical science which treats of the relations of heat to work. What is called the first law of thermodynamics is thus stated by Clerk Maxwell. When work is transformed into heat or heat into work the quantity of work is mechanically equivalent to the quantity of heat. In one of its many formulations the second law asserts that the heat tends to flow from a body of higher temperature to one that is colder and will not naturally flow in any other way. *See* F17(1).

Thermo-electric Devices. If two wires of different materials are formed into a loop and if the two joins are kept at different temperatures a current flows in the loop. This was discovered by Seebeck in 1822 and the device is called a thermocouple. The electric current could in principle be made to drive some useful machine and the energy comes from the heat that is absorbed by the thermocouple. One part of the thermocouple is not hotter than the others it will not work. It has long been realised that this is a device that converts heat directly into electricity without raising steam and driving dynamos as in a power station. However until recently nobody has used thermocouples for much besides temperature measurement for which they are exceedingly useful. The new development is the manufacture of semiconductors (*see*) for the thermo-electric effects of these new materials are much greater than those of metals. A material much studied in this connection is a compound of bismuth and tellurium, bismuth telluride. It now seems

practicable to generate useful electricity from suitably designed thermocouples. For example the U.S.S.R. produces a thermoelectric device which uses the heat from the chimney of a domestic oil lamp to produce enough electricity to work a radio. Presumably this is very useful in remote parts with no electricity supply. But the possibilities do not stop there. Indeed an eminent Russian an authority has stated that thermocouples could produce electricity direct from the warmth of sunlight on a scale and at a cost comparable with conventional fuel burning power stations. Even if solar energy cannot be so used it might be possible to use the heat of nuclear reactors, but this means that the thermoelectric devices would have to stand up to very heavy radioactivity and still work. It is not surprising however that many firms are showing great interest in thermoelectricity these days.

Thermometer an instrument by which the temperature of bodies is ascertained. The most familiar kind of thermometer consists of a glass tube with a very small bore containing in general mercury or alcohol. This expands or contracts with variation in the temperature, and the length of the thread of mercury or alcohol gives the temperature reading on a scale graduated in degrees. Various forms of thermometer are used for particular purposes.

Thermonuclear Reactions See Nuclear Fusion
Thirty nine Articles See Articles.

Thistle Order of See Knighthood.

Thorium, a scarce, dark grey metal element symbol Th discovered by Berzelius in 1828. All substances containing thorium are radioactive. Chief source of thorium is monazite sand, big deposits of which occur in Travancore (India), Brazil and the U.S.A. Considered important as a potential source of atomic energy since the discovery that it can be transmuted into U233 which is capable of fission like U235.

Thrush a large family of song birds of the *Passeriform* order distributed all over the world. The British species include the robin, redstart, nightingale, song thrush (or mavis), blackbird, mistle-thrush, ring-ouzel of the mountains and large numbers of migrant fieldfares and redwings from northern Europe are winter visitors.

Thunder the sound heard after the occurrence of a lightning flash. It is due to vibrations of the air along the path of the flash, which are set up by the sudden heating (and expansion) followed by the rapid cooling (and contraction) to which the air is subjected. It is unusual for thunder to be heard more than 10 miles away, the distance being estimated roughly by allowing 1 mile for every 5 seconds which elapse between seeing the flash and hearing the thunder. Continued rolling of thunder results from the zig zag nature of the flash and the multiple strokes of which it is composed, variations in the energy developed along the path, and echo effects. Thunder storms are caused by powerful rising currents of air within towering cumulonimbus clouds and are most frequent during the afternoons and evenings of sunny summer days.

Thursday the 5th day of the week, named after Thor the Scandinavian deity. To the ancient Romans Thursday was *dies Jovis* or Jupiter's day.

Tidal Power The principle of exploiting the energy of the tides is similar to hydro-power since it involves the harnessing of falling water. A barrage across a bay or estuary is filled during flow tide and closed during ebb tide creating a difference in level. When the water is allowed to fall towards the lower side of the barrage it operates a turbine which drives a generator. More sophisticated schemes would incorporate pumped storage facilities. An essential requirement is a large tidal range in order to get a sufficient head of water. Although a 240MW scheme has recently been completed on the River Rance in France, it is believed that the economies of tidal power are generally insufficiently favourable for the method to be widely used. See also **Electroelectric Schemes**.

Tides the periodical rise and fall of the waters of the ocean and its arms are due to the gravitational effect of the moon and sun. Newton was

the first to give a general explanation of the phenomenon of the tides. He supposed the ocean to cover the whole earth and to assume at each instant a figure of equilibrium under the combined gravitational influence of earth, sun and moon thus making and controlling the tides. At most places there are two tides a day and the times of high and low water vary according to the positions of the sun and moon relative to the earth. When earth, moon and sun are in line (at full moon and new moon) the gravitational pull is greatest and we get spring tides. When sun and moon are at right angles (first and third quarters of the moon's phases) we get the smaller neap tides.

Tiers Etat the lowest of the three estates of the realm as reckoned in France—nobility, clergy and commons (*tiers état*)—prior to the Revolution.

Tiger a powerful carnivorous animal of the cat family which occurs in India and certain other parts of Asia. Its skin is of a tawny yellow relieved by black stripings of great beauty of formation. Some tigers attain a length of from 9 to 12 ft.

Time The measurement of time has become of increasing importance to man with the advance of civilisation. It was at first almost inevitably based on the succession of night and day, the waxing and the waning of the moon, and on the changing seasons of the year and the astronomical observation of these three periodic effects has served as the basis of time measurement until recent years. The precision of the observations has continually increased and clocks have been developed for dividing the day into smaller units. The clocks were adjusted so as to keep in step with the rotation of the earth on its axis but during recent years an atomic standard of time has been developed and clocks are now adjusted so as to keep in step with the natural period of an atomic vibration. See **Clocks**, **Greenwich Mean Time**, **British Standard Time**.

Tin is a white, metal element symbol Sn (Latin *stannum*) whose commonest ore is cassiterite (tin oxide) which occurs in Malaya, Indonesia, Bolivia, Congo, Nigeria and Cornwall. It protects iron from rusting and the tin coating on tinplate is applied by dipping the thin steel sheet in molten tin or by electrolysis. Tin alloys of importance include solder, bronze, pewter and Britannia metal.

Tit or **Titmouse** a small insectivorous bird of the woodlands and forests. Bright of plumage and very active and agile, often seen hanging upside down searching for food. There are over fifty species, eight of which occur in Britain: the Great and Blue Tits, familiar in gardens and countryside; the Cole Tit, Marsh Tit, Willow Tit, Bearded Tit, Long tailed or Bottle Tit and the Scottish Crested Tit.

Titanium, a scarce metal symbol Ti, difficult to extract from ores found in association with oxygen in rutile, anatase and brookite, as well as with certain magnetic iron ores. It combines with nitrogen at a high temperature. Discovered by the Rev William Gregor in 1791. Titanium alloys, being very resistant to stress and corrosion and combining strength with lightness are finding wide application not only in marine and chemical engineering but in the building of aircraft, rockets, and the nuclear energy field. Titanium dioxide is now widely used in making paints.

Tithes, an ecclesiastical tax consisting of a tenth part of the annual produce known to the ancient Jews, and first imposed by Christian authorities in the 4th cent. although not made compulsory in England before the 9th cent. Tithes derived from land are termed 'praedial' those derived from cattle being styled 'mixed', while others are personal. After the passing of the Tithes' Commutation Act of 1836 tithes were gradually converted into rent charges, and to day the old form of tithes exists only by a small decree. Consult *Tithes Act of 1836*.

TNT (*Trinitrotochene*). A high explosive formed by the action of a mixture of nitric and sulphuric acids on toluene. Not highly sensitive to shock, it can be used in shells without danger, and is exploded by a time, or detonator fuse. Apart

from wartime applications it is used in blast n. in quarries and mines.

Toad, an amphibian suffering from the frog in having a dry warty skin a heavier squat build and shorter limbs. It has a similar metamorphosis is largely nocturnal and will wander far from water after the breeding season. Two toads occur in Britain the Common Toad and the Natterjack. The latter can be identified by the narrow light stripe running down the middle of the back.

Tobacco is made from the leaves of various native plants of the *Nicotiana* family which contain a volatile oil and an alkaloid called nicotine. Tobacco is largely grown in America India Japan Turkey Greece Canada Italy Indonesia Bulgaria Philippines France Congo China Rhodesia Zambia S Africa S America and other countries of a warm climate. It undergoes various processes of preparation. The leaves are first dried then cut into small pieces moistened and compressed and in this form it is known as cut or shag tobacco when moistened with syrup or treacle and pressed into cakes it is Cavendish when twisted into string form it is twist or pig tail. For cigars the midribs of the dry leaves are removed and what is left is moistened and rolled into cylindrical shape. For snuff the tobacco leaves are moistened and allowed to ferment then dried powdered and scented. See Section F (Respiratory System) for the connection between tobacco smoking and lung cancer.

Tolls Payments for privileges of passage were first exacted in respect of ships passing up rivers tolls being demanded on the Elbe in 1109. Tolls for land passage are said to have originated in England in 1269 toll bars being erected at certain distances on the high roads in the 17th cent. where toll had to be paid for all vehicles passing to and fro. After about 1825 they began to disappear but still linger on some country roads and bridges. Tolls on London river bridges ceased in 1878-79.

Tonic Sol-Fa, a system of musical notation in which monosyllables are substituted for notes. Thus the major diatonic scale is represented by Doh Ray Me Fah Soh La Te Doh. The system was invented by a Miss Glover of Norwich in about 1840 and has proved of great assistance in the teaching of music in schools.

Tonsure the shaven part of the head of a Roman Catholic ecclesiastic dates from the 5th or 6th cent. In the Roman Catholic Churches only a circle, or a crown is shaved while in the Greek Church shaving is forbidden.

Topaz a transparent mineral gem being a silicate and fluoride of aluminum and generally found in granitic rocks. Its colour is yellow but it also occurs in pink and blue shades. The best kinds come from Brazil.

Topiary the art of clipping and trimming trees shrubs etc into ornamental shapes. In Britain this art goes back before Elizabethan times when gardens were formal and the shapes simple and symmetrical. By the end of Queen Anne's reign topiary had become much more elaborate and all kinds of fanciful shapes were produced. Phny in his *Letters* tells how box hedges were clipped into different shapes in Roman times.

Tornado a violent whirlwind, characterised by a black, funnel shaped cloud hanging from heavy cumulonimbus. Usually tornadoes are only a few hundred feet in diameter and occur frequently in the Mississippi region of the U.S.A. where it has been estimated that the wind speeds within them may exceed 200 m.p.h. In West Africa the term is applied to thunder squalls.

Tortoises and Turtles, are cold blooded reptiles four-footed, and encased in a strong shell protection, the shells of some species being of beautifully horny substance and design in much demand for combs, spectacle frames and ornamental work. It is the custom to designate the land species as tortoises and the aquatic kinds as turtles. The green turtle so called because its fat has a green tinge is in great demand for soup. Together the tortoises and turtles make up the reptilian order called *Chelonae*, the biggest representatives of which

are the giant land tortoises of the Galapagos Islands reaching a weight of 500 lb and living 1 century. Some of these giant tortoises are even said to have reached 200 or 300 years of age.

Toucan a South and Central American family of brilliantly coloured birds remarkable for their huge bills. Toucans live on fruit are of arboreal habits and nest in holes. There are about 37 species.

Touchstone a kind of jasper called by the ancients Lydian stone of economic value in testing the quality of metal alloys especially gold alloys. The testing process is very simple. The alloy is drawn across the broken surface of the Touchstone and from the nature of the mark or streak it makes the quality of the alloy can be ascertained.

Tourmaline a mineral occurring in different colours in prismatic crystals. It is a well known example of a pyro electric crystal i.e. one that has a permanent electric polarisation. It is a double silicate of aluminum and boron and occurs in Cornwall Devon South America and Asia.

Tournaments were equestrian contests between military knights and others armed with lances and frequent in the Middle Ages. The Normans introduced them to England.

Tower of London was built as a fortress by William the Conqueror. It was a royal palace in the Middle Ages and later used as a garrison and prison. Many distinguished prisoners were executed there including Anne Boleyn Catherine Howard Lady Jane Grey the 2nd Earl of Essex and Sir Walter Raleigh. The Chapel Royal of St Peter and Vincula in the Tower was built in 1106 and took its present shape in the reign of Henry VIII. The Crown Jewels are kept at the Tower and in the Armoury fine collection of armour is preserved. The attendant staff are called Yeomen Warders of the Tower. Their style of dress is of the Tudor period.

Trade Mark a mark used in relation to goods for the purpose of indicating a connection in the course of trade between the goods and some person having the right either as a proprietor or registered user to use the mark. Trade marks can be registered the registration holding good for 7 years and being renewable thereafter in definitely for periods of 14 years. Infringement of a registered trade mark renders the infringer liable to damages.

Trade Winds form part of the circulation of air round the great permanent anticyclones of the tropics and blow inwards from north east and south east towards the equatorial region of low pressure. Atlantic trades are more regular than those of the Pacific. The belts may extend over 1 500 miles of latitude and together with the Doldrums move north and south in sympathy with the seasonal changes in the sun's declination the average annual range being about 5 degrees of latitude.

Trafalgar Battle of was fought off Cape Trafalgar on Oct 21 1805 between the British under Nelson and the French and Spanish under Villeneuve and Gravina. It was a complete victory for the British but Nelson was killed.

Trafalgar Square The site has often been referred to as the finest in Europe. It was conceived originally as a square by John Nash (1752-1835) when the project was considered of linking Whitehall with Bloomsbury and the British Museum. It was to be named after the new monarch as King William the Fourth's Square but on the suggestion of George Ledwell Taylor (a property owner near the site) altered to the more popular name Trafalgar Square was agreed to by the King. On the north side the National Gallery was planned by Nash and erected by William Wilkins on the place of the Royal Mews—a work of William Kent a century before. The lay out was the idea of Charles Barry but he did not approve the erection of the Nelson column (which see). His idea was for the square to have a grand flight of steps from the north side with sculptural figures of Wellington and Nelson but the Commons decided otherwise and the column as designed by William Railton was begun in 1840. The two fountains by Barry were supplanted in 1948 by ones designed (1938)

by Sir Edwin Lutyens. Executed in Portland stone they are flanked by some bronze sculptures. In the same year memorial busts of Lords Jellicoe and Beatty were placed by the north wall.

Transept the portion of a church which extends across the interior between the nave and the choir.

Transistor An electronic device consisting of a small piece of semiconducting solid (usually germanium or silicon) to which contact is made at appropriate places by three wires. The three parts resemble in function (not construction or behaviour) the cathode anode and grid of a thermionic valve and transistors can perform many of the operations that valves have hitherto been used for in radio television etc. They possess several advantages over valves since there is no need for evacuated glass bulbs nor for a heated emitter to give off electrons. This leads to much greater compactness and economy as well as to a much longer life. Nevertheless there are certain limitations to their use and they are not yet suitable as substitutes for valves in all cases. The device was invented by the Americans Bardeen Brattain and Shockley in 1948.

Transubstantiation. See J50

Treasure Trove a legal term applying to treasure (coin bullion gold or silver articles) found hidden in the earth or other place for which no owner can be discovered. The treasure legally belongs to the Crown but it is the practice to return to the finder all articles not required for national museums and to reward him with the full market value of such as may be retained. It is the duty of the finder to report to the Coroner for the district in which the find is made who holds an inquest to find whether the discovery be treasure trove or no. In England concealment is a criminal offence. See also Wreck.

Tree Frog occurs most commonly in America and Australasia. The common European tree frog is a brilliant green animal the adhesive discs at the tips of its fingers and toes enabling it to cling to trees etc. with ease.

Tree Shrew an arboreal insectivorous mammal of Asia belonging to the family *Tupauidae*. Tree shrews are related to the shrews though in appearance they resemble squirrels except for their sharply pointed snout. They occur in Borneo Siam, China and Malaya. Some zoologists classify them as primitive primates.

Trent Council of the longest and one of the most important in the history of the Roman Catholic Church was convened to combat the doctrines of Martin Luther. It first sat in 1545 the last sitting being in 1563. At this Council the general policy principles and dogmas of the Roman Catholic Church were authoritatively settled.

Triassic or Trias, the earliest geological period in the Mesozoic era which began some 225 million years ago. Triassic formations 25 000 ft thick occur in the Alps. Modern insects were appearing and also small reptile-like mammals. Other important Triassic animals were dinosaurs (ichthyosaurs (marine reptiles) and pterosaurs (flying reptiles)). See F44.

Tribunes name assumed to officers of different descriptions in ancient Rome. The original tribunes were the commanders of contingents of cavalry and infantry. The most important tribunes were the tribunes of the plebs, first elected in 494 B.C. as the outcome of the struggle between the patrician and the plebeian orders. They held the power of veto and their persons were sacred.

Trichoptera. This is the insect order comprising the Caddis-flies. These are moth like insects having hairs on the wings. They are usually found fluttering weakly near water. The larvae are aquatic and are remarkable for the cases (caddis cases) which they build out of sticks, small stones sand grains, and shells.

Tricolour the flag of the French Republic since 1789 consisting of three nearly equal vertical bands of blue white and red (ratio 90 90 90 111).

Trilobites, extinct marine arthropods, most abundant in the Cambrian and Ordovician systems. Their appearance may be roughly described as resembling that of a woodlouse,

and like that animal the trilobites were capable of rolling their bodies up into a ball.

Trinity. The Christian doctrine that God exists in three persons all co equal and indivisible of the same substance—God the Father God the Son (who became incarnate as Jesus) begotten of the Father and God the Holy Ghost proceeding from Father and Son. The system denying the Trinity is Unitarianism (see J51).

Trinity House, on Tower Hill London, was incorporated in 1514 as an association for piloting ships, and has ever since been entrusted with various matters connected with the regulation of British navigation. Since 1854 the light houses of the country have been under its supervision. The acting Elder Brethren act as Nautical Assessors in Marine causes which are tried by the High Court of Justice.

Triptych, a picture carrying or other representation with two swing doors by which it could be closed in frequently used as an altar piece. Also a writing tablet in three parts, two of which folded over the one in the centre.

Trireme an ancient vessel with three rows of oars of great effectuality in early naval warfare. Mentioned by Thucydides. It was a long narrow vessel propelled by 170 rowers. The Romans copied it from the Greeks.

Trisagion (thrice holy) an ancient Jewish hymn, still regularly sung in the service of the Greek Church. A version of it—Tersanotus—also forms part of the Anglican Eucharistic service.

Tritium, a radioactive isotope of hydrogen which has three times the weight of the ordinary hydrogen atom. It is produced by bombarding an isotope of lithium with neutrons and has a half life of 12 years, decaying with the emission of β -particles (electrons).

Triumvirate, a term used to denote a coalition of three persons in the exercise of supreme authority. The first Roman triumvirate was that of Pompey Julius Caesar and Crassus 60 B.C. the second was that of Mark Antony Octavian and Lepidus 43 B.C.

Tropic-Bird, a long tailed sea bird of which there are 3 species (the Red billed the White-tailed, and the Red tailed), frequenting the tropical regions of the Atlantic Pacific and Indian oceans. They are commonly called Bo sun Birds.

Troposphere The atmospheric layer which extends from the earth's surface to the stratosphere. As a general rule the temperature in the troposphere falls as altitude increases. See Atmosphere.

Troubadours, lyric poets who flourished from the 11th to the end of the 13th cent. chiefly in Provence and the north of Italy. They were often knightly amateurs, and cultivated a lyrical poetry intricate in metre and rhyme and usually of a romantic amatory strain. They did much to cultivate the romantic sentiment in days when society was somewhat barbaric and helped considerably in the formation of those unwritten codes of honour which served to mitigate the rudeness of mediaeval days. See also Jongleurs.

Trouvère or Trouverre mediaeval poet of northern France whose compositions were of a more elaborate character—epics, romances, fables and chansons de geste—than those of the troubadour of the south. Flourished between the 11th and 14th cent.

Truffles are subterranean edible fungi much esteemed for seasoning purposes. There are many species and they are found in considerable quantities in France and Italy less commonly in Britain. They are often met with under beech or oak trees and prefer calcareous soils but there are no positive indications on the surface to show where they are, and they are not to be cultivated. Hogs, and sometimes dogs are used to scent them out the former by reason of their rooting propensities being the most successful in the work.

Tsetse an African dipterous fly belonging to the same family as the house-fly. It is a serious economic pest as it transmits the protozoan causing African sleeping sickness when it pierces human skin in order to suck blood which forms its food. See Gammesane.

Tuskara or Sphenodon punctatum, a primitive lizard found in New Zealand. It has a rudimentary

third eye on the top of the head this is called the pineal eye and corresponds to tissue which in mammals forms the pineal gland.

Tube Foot, the characteristic organ of loco motion of starfishes and kindred animals. They are arranged in pairs along the underside of the arms and their sucker-like ends can grip a surface very tightly. The action of the suckers depends on hydraulic pressure.

Tudor Period extends from 1485 to 1603. The first Tudor sovereign was Henry VII descended from Owen Tudor then followed Henry VIII, Edward VI, Mary and Elizabeth the last of the line.

Tuesday the third day of the week named from the Saxon deity *Tiw* or *Teneo*. To the Romans it was the day of Mars.

Tuileries a French royal and imperial palace dating from 1564. It was attacked by insurgents during the outbreaks of 1792, 1830 and 1848, and was burned down during the Commune of Paris in 1871.

Tumulus a mound of earth raised over the bodies of the dead. The mound of Marathon, enclosing the bodies of the Athenians who were killed in the famous battle with the Persians, is a celebrated tumulus. Such mounds were commonly raised over the tombs of the distinguished dead in ancient times and sometimes enclosed heavy structures of masonry. The Roman barrows were tumuli. Evidences of such mounds are frequent in prehistoric remains.

Tuna or Tunny a large marine fish belonging to the mackerel family frequenting the warm waters of the Atlantic Pacific and Mediterranean.

Tundra the vast barren treeless plains with small lakes and morasses lying in the arctic regions of northern N. America and northern Russia where the winters are long and severe and the soil permanently frozen. Sparsely inhabited by nomadic peoples—Lapps, Samoyeds and Eskimos—who support themselves by hunting and fishing. The remainder is domesticated and supplies most of their needs.

Tungsten a hard brittle metal, symbol W (it was formerly called wolfram silver to grey in colour. Its chief ores are wolframite (iron and manganese tungstate) and scheelite (calcium tungstate). Tungsten is alloyed in steel for the manufacture of cutting tools, also in the non ferrous alloy stellite (*qv*). Electric lamp filaments are made from tungsten. Tungsten carbide is one of the hardest substances known and is used for tipping tools.

Turbines propelled by steam provide power for the propulsion of many ships and on land steam turbines are a principal source of power being used in large central electricity stations, for instance to convert heat energy into electrical energy. Gas turbines have recently come into use in aeroplanes, and gas turbine railway locomotives are being developed. The first gas-turbine ship had its trials in 1947 just half a century after the first steam turbine ship.

Turbot a large flat fish highly valued as food. It often attains from 30 to 40 lb in weight. Its flesh is white and firm. It is confined to European waters and is caught by line or trawl.

Turkey a fowl of American origin brought to Europe from America soon after the discovery of that country. It was a domesticated bird in England in the first half of the 16th cent.

Turpentine an oily substance obtained from coniferous trees, mostly pines and firs. It is widely used especially in making paints and varnishes and also has medicinal properties.

Turquoise formerly called Turkey Stone, is a blue or greenish-blue precious stone, the earliest and best specimens of which came from Persia. It is composed of a phosphate of aluminum with small proportions of copper and iron. India, Tibet and Silesia yield turquoise and a variety is found in New Mexico and Nevada. It derives its name from the fact that the first specimens were imported through Turkey.

Turtle Dove, a summer visitor from Africa to southern England. It is a small, slender bird with reddish-brown upper parts, pinkish throat, black tail with white edges, and a repeated purring note.

Tweed, a rough surfaced fabric of the twilled type usually all wool, though cheaper kinds may include cotton. Of a soft, open, flexible texture

it may have a check twill or herringbone pattern. Harris Tweeds, Bannockburn and Donegal tweeds are well known. Tweeds are said to have been written in error by a clerk for twills.

Twelfth Night is the eve of the feast of the Epiphany and in olden times was made the occasion of many festivities. It was the most popular festival next to Christmas but is now little observed.

Twilight is the light which is reflected from the upper portion of the earth's atmosphere when the sun is below the horizon (before sunrise or after sunset). The term is most usually understood to refer however to the evening light the morning light we call dawn. The twilight varies in duration in different countries according to the position of the sun. In tropical countries it is short in the extreme north it continues through the night.

Tyburn a former small tributary of the Thames which gave its name to the district where now stands the Marble Arch Hyde Park. Here public executions formerly took place.

Tycoon the title by which the commander in chief of the Japanese army (virtually the ruler of Japan) was formerly described by foreigners. (In Japanese *taikun* means great lord or prince.) The term is now applied usually in a derogatory sense to an influential business magnate.

Tympanum is in architectural phraseology the triangular space at the back of a pediment or indeed any space in a similar position as over window or between the lintel and the arch of a doorway. In ecclesiastical edifices the tympanum is often utilised for sculptured ornamentation.

Tynwald, the title given to the Parliament of the Isle of Man which includes the Governor and Council (the Upper House) and the House of Keys the representative assembly. This practically constitutes Home Rule. The Acts passed by the Tynwald simply requiring the assent of the Sovereign.

U

Uhlans, a light cavalry soldier armed with lance, pistol and sabre and employed chiefly as skirmisher or scout. Marshal Saxe had a corps of them in the French Army and in the Franco-German war of 1870 the Prussian Uhlans won fame.

Ultramarine a sky blue pigment obtained from lapis lazuli a stone found in Tibet, Persia, Siberia and some other countries. A cheaper ultramarine is now produced by grinding and heating a mixture of clay, sulphur, carbonate of soda and resin.

Ultrasonics sound waves of frequency so high as to be inaudible to humans (i.e. about 20,000 cycles per sec. and upwards). Ultrasonic waves are commonly produced by causing a solid object to vibrate with a suitably high frequency and to impart its vibrations to the air or other fluid. The object may be a quartz or other crystal in which vibrations are excited electrically or a metal component which is magnetically energised. There are numerous technical applications e.g. submarine echo sounding, flaw detection in castings, drilling glass and ceramics emulsification. Ultrasonic waves are an important tool of research in physics. Bats produce very loud sounds when they are flying but at ultrasonic frequencies (20,000 to 100,000 c/s) so that we cannot ourselves hear them.

Ultra-Violet Rays These are invisible electromagnetic rays whose wavelengths are less than 3,900 Å (Angstrom = one-hundredth of a millionth of a centimetre). The sun's radiation is rich in ultra-violet light, but much of it never reaches the earth being absorbed by molecules of atmospheric gases (in particular ozone) as well as by soot and smoke particles. One beneficial effect of ultra-violet light on human beings is that it brings about synthesis of vitamin D from certain fatty substances (called sterols) in the skin. The wave-lengths which effect this vitamin synthesis also cause sun-tan and sun burn. Ultra-violet lamps (which are mercury vapour discharge lamps) are also used for sterilising the air inside buildings, their rays

being lethal to bacteria. Many substances fluoresce under ultra violet light for instance zinc silicate glows green while cadmium borate throws out red light. This phenomenon is applied practically in fluorescent lamps the light of requisite hue being secured by judicious mixture of the fluorescent materials which coat the lamp. *See Electric Light*

Umbra the full shadow of the earth or moon during an eclipse the half shadow is called penumbra

Unciae The Romans took over the Egyptian cubit and divided it into 16 digits as well as into 12 parts called *unciae* the *uncia* being the origin of the inch.

Unction, the act of anointing with oil a symbol of consecration practised in the Roman Catholic Greek and other Churches but not in the Protestant. *Extreme unction* is the rite of anointing a dying person with holy oil. This function consists in anointing the eyes ears nostrils mouth the palms of the hands and the soles of the feet

Underdeveloped Countries are countries in which primitive methods of production still largely prevail. Most of the population are peasants carrying on agricultural pursuits on small holdings without much use of capital and the industrial production is largely in the hands of individual craftsmen working without expensive capital instruments. Many of these countries are now trying to carry through large plans of industrialisation but are severely hampered by lack of capital resources as they need to import capital goods for which they find it difficult to pay with exports especially when the terms of trade (see G6) are unfavourable to primary producers. The need for capital imposes on such countries the necessity of a high rate of saving out of their national incomes but this is difficult to enforce in view of the deep poverty of most of the people. They accordingly stand in need of help from the advanced countries both with capital loans at low interest rates and gifts. *See Section G Part III*

Unicorn a fabulous single horned animal. In heraldry its form is horse like with the tail of a lion and pointed single horn growing out of the forehead. In the Middle Ages the unicorn was a symbol of virginity

Union of Great Britain and Ireland was proposed in the Irish Parliament in Jan 1799 after the 1798 Rebellion and came into force on Jan 1 1801. The troubled history of Ireland associated with the question of self government nationalism land and religion, culminated in the Easter revolution of 1916. A treaty giving the 26 southern counties independence in 1921 as the Irish Free State was followed by a period of internal desecration. In 1937 a new constitution was enacted in Eire in which no reference was made to the Crown. This however left in force the External Relations Act of 1936 and with its repeal in 1948 Eire separated itself from the British Crown and thus severed the last constitutional link with the Commonwealth and became an independent Republic

Union Treaty of was the treaty by which Scotland became formally united to England, the two countries being incorporated as the United Kingdom of Great Britain the same Parliament to represent both Scotland electing sixteen peers and forty five members of the House of Commons. Uniformity of coins weights and measures was provided for Scottish trade laws and customs were assimilated to those of England, and as regards religion and the practices of the law Scotland was to continue as before. This Act was ratified on May 1 1707

United Nations *See Section C Part II*

Universe in astronomy means not only the star system (of which the sun and planets are a small part) but all the countless star systems or nebulae which may be separated from each other by millions of light-years. *See F3-7*

Universities are institutions of higher education whose principal objects are the increase of knowledge over a wide field through original thought and research and its extension by the teaching of students. Such societies existed in the ancient world, notably in Greece and India, but the origin of the University as we know it today lies in mediaeval Europe the word

universitas being a contraction of the Latin term for corporations of teachers and students organised for the promotion of higher learning. The earliest bodies to become recognised under this description were at Bologna and Paris in the first half of the 12th cent. Oxford was founded by an early migration of scholars from Paris and Cambridge began with a further migration from Oxford. Other Universities sprang up all over Europe including three in Scotland—St Andrews (1412) Glasgow (1451) and Aberdeen (1494)—which were followed by Edinburgh in 1582. These six bodies remained the only Universities in Great Britain until the foundation in 1826-29 of University and King's Colleges in London (resulting in the establishment of the University of London in 1836) and of the University of Durham in 1832. There are (1971) thirty three Universities in England: Aston Bath Birmingham Bradford Bristol Brunel Cambridge The City Durham East Anglia Essex Exeter Hull Keele Kent Lancaster Leeds Leicester Liverpool London Loughborough Manchester (including Manchester University Institute of Science and Technology) Newcastle Nottingham Oxford Reading Salford Sheffield Southampton Surrey Sussex Warwick York, in addition to the Royal College of Art which under Royal Charter (1907) grants the degrees of Doctor Master and Bachelor of Art or Design (B.C.A.) and the postgraduate University of Cranfield (aeronautics). Formed from colleges of technology art and design commerce and other institutions thirty polytechnics have been established in England and Wales as centres of higher education. Wales has one University (The University of Wales with colleges at Aberystwyth Bangor Cardiff and Swansea) in addition to St David's Lampeter which confers two degrees (in Arts and Theology) and the Welsh College of Advanced Technology Cardiff which is expected to be granted university status. Scotland now has eight: Aberdeen Dundee (1967) Edinburgh Glasgow Heriot Watt (1966) St Andrews Stirling (1967) and Strathclyde (1964). Britain's first technological University Northern Ireland has two: Queen's University Belfast and the New University of Ulster at Coleraine. The number of full time students in the United Kingdom is expected to reach between 250 000 and 225 000 in 1971 over four times the number at the end of the war. The Open University received its charter in 1969 it provides degree and other courses together with radio and television programmes and began its broadcasts in January 1971. The Republic of Ireland now has three Universities: Dublin Cork and Galway. The 19th cent also saw a wide extension of the University movement throughout the British Empire the early important foundations being McGill (1821) Toronto (1827) and Laval (1852) in Canada. Sydney (1850) and Melbourne (1853) in Australia New Zealand (1870) South Africa (1873) Bombay Calcutta and Madras in 1857 in India and the University of the Punjab (1882) in the present Pakistan. Since the war a number of Universities and University Colleges have been instituted in Commonwealth countries—in the West Indies in East and West Africa and Rhodesia in Malaysia, India and Pakistan. In the U.S.A. the development of higher education has left the Universities less sharply defined than in Europe and the Commonwealth the best known being Harvard Yale Princeton, Columbia and Chicago. In Britain Universities receive aid from the State mainly in the form of direct grants from the Treasury made on the advice of the University Grants Committee. But they are self governing institutions free from State control. In recent years students have increased their contributions to the formulation of university policy. *University Boat-race. See U35*

Uranium, a metal symbol U discovered by Klaproth in 1789 in pitch-blende. It is a white metal which tarnishes readily in air. Great developments have followed the discovery that the nucleus of the uranium isotope U^{235} under goes fission, and uranium minerals have become very important since it was found that atomic

energy could be released controllably by taking advantage of fission. Previous to the second world war the uranium content of all the uranium ores that were mined was estimated at 1 000 tons. Before atomic energy work began to take the major part of the world's output of uranium minerals the chief users of uranium compounds were the ceramics and textile industries. See also Nuclear Reactors, Nuclear Fission F12(1)

Uranus. This planet was discovered by Herschel in 1781. Its diameter is 32 000 miles and its average distance from the sun is 1 783 million miles. It has five small satellites.

Urea the final product in mammals of the breakdown of nitrogenous waste e.g. excess amino acids. It is very soluble in water and is excreted in urine. In 1828 Wohler synthesised urea from inorganic matter. This was the first laboratory synthesis of an organic substance and refuted the idea that living creatures or life force are necessary to create such substances.

Ursa Major the Greater Bear or Charles's Wain a constellation familiar to all observers because of the brilliance of the seven stars forming its outline. It never sets in these latitudes.

Ursa Minor the Lesser Bear Constellation which like Ursa Major seven prominent stars of which the pole star is the brightest.

Utopias. See J51

V

Valency A term used by chemists to describe the combining ability of an element with respect to hydrogen. Thus oxygen which forms water H_2O with hydrogen is said to have a valency of two nitrogen (forms ammonia NH_3) three and carbon (forms methane CH_4) four. Chlorine forms hydrogen chloride HCl and is said to be monovalent. This empirical approach cannot account for valency in such compounds as carbon monoxide CO which appears to require both elements to have the same valency. With the discovery of the electron it was realised that the concept of valency and chemical bonds is intimately concerned with the electronic structure of atoms and theories have been advanced to explain why the same element can have different valencies in different compounds. Iron for example can have a valency of two ($FeCl_2$, ferrous chloride) or three ($FeCl_3$, ferric chloride). See F20(2) F68

Valentine's Day the 14th Feb is a festival in celebration of St Valentine one of the Christian martyrs of the 3rd cent. A sweet heart or Valentine is chosen on that day and letters or tokens sent secretly to the object of affection.

Valhalla in Scandinavian mythology is the special Paradise to which the souls of warriors slain in battle were transported. The term is also generally used to designate a burial place of great men.

Valkyries the chosen handmaidens of Odin appointed to serve at the Valhalla banquets. Their most important office however according to the Norse mythology was to ride through the air at a time of battle and point out the heroes who were to fall. It is one of these Valkyries who is made the heroine of Wagner's opera Die Walküre.

Valve an electronic device consisting of two or more metal plates (electrodes) usually enclosed in an evacuated glass bulb. One of the electrodes is heated causing electrons to be emitted. If a positive voltage is applied to the other electrode the electrons will move towards it and the valve must conduct electricity. The current will only flow in one direction as the electrons are emitted only from one electrode. A valve with two electrodes is called a diode but by putting in one or more intermediate electrodes the flow of current can be sensitively controlled and the valves are then called triodes, pentodes, etc. according to the total number of electrodes in them. Valves have found extensive applications in amplifiers, rectifiers, oscillators, and many electronic devices, but are now being superseded by transistors in many applications where it is advantageous to have greater reliability, smaller power consumption, and smaller size.

Vampire or Werewolf according to ancient superstition was a specter in human form which rose from its grave in the night time and preyed upon the living as they slept, sucking their blood and then returning to the grave.

Vampire Bats blood eating bats of tropical America. They puncture the skin with their incisor teeth leaving a wound that bleeds profusely. The blood is lapped up by the bat not sucked.

Vanadium a scarce metallic element symbol V whose chief ores are carnotite and patronite. Some iron ores contain it. Most of the vanadium commercially produced finds its way into vanadium steels which are used for tools and parts of vehicles being hard tough and very resistant to shocks. The oxide is used as a catalyst in industry especially in making sulphuric acid.

Van Allen Belts One of the most remarkable discoveries made during the IGY 1957-58 was that the earth is surrounded by a great belt of radiation. Evidence came from *Sputnik II* (which carried the dog Laika) and from the American satellites *Explorer I* and *III*. The American scientist J. A. van Allen was able to explain the puzzling data collected from these satellites. Subsequent observations with deep space probes showed that there are in fact two zones of high intensity particle radiation surrounding the earth, one concentrated at a distance of about 1 000 miles the other at about 15 000 miles. A close relation exists between the shapes of the zones and the earth's magnetic field. Recent evidence suggests that Jupiter also is surrounded by a dense belt of trapped energetic particles.

Varnish is of two leading kinds spirit varnish made from resinous substances dissolved in spirit and oil varnish in which the dissolving agent is linseed oil and turpentine.

Vatican, the Papal residence at Rome a famous palace on the hill adjacent to St Peter's. Its museum is a rich treasure house of literary and artistic objects.

Vauxhall Gardens a famous London pleasure resort from the early part of the 18th to the middle of the 19th cent. It was here that many great singers appeared where the earliest balloon ascents were made and where there were fine displays of fireworks.

Vein See Lode

Venus the brightest of all the planets whose orbit lies between that of Mercury and the earth second in order from the sun (see F7). It can approach the earth to within 25 million miles. In common with all the other planets it moves around the sun in the same direction as the earth, but is the only one that rotates about its axis in the opposite direction. The planet takes just under 225 earth days to complete an orbit round the sun. In 1967 Russia succeeded in soft landing an instrumented canister from their *Venus 4* research spacecraft. Measurements gave a picture of a very hostile environment—high surface temperature, a very high atmospheric pressure, an atmosphere 15 times denser than on earth of almost pure carbon dioxide. *Venus 5* and *Venus 6* made twin landings in May 1969 and sent back data on the planet's mysterious veil of white clouds.

Venus Fly trap a well known insectivorous plant (*Dionaea muscipula*) occurring in Carolina in damp mossy places. It is related to the Sun dew. The leaf is the organ that catches the insects. The leaf blade is in two halves hinged along the centre line. Each half bears three sensitive hairs called trigger hairs. When an insect touches a trigger the two halves of the leaf snap together trapping the insect between them, when it is digested by a secretion (digestive enzymes) from the leaf which afterwards absorbs the soluble products.

Vernalization Seeds which, after being exposed to a low temperature produce plants that flower earlier than usual are said to have been vernalized. This technique of seed treatment devised by Lyсенko is called vernalization. It is claimed to have been widely used in Russia to obtain cereal crops in places where climatic conditions are favourable for only a short season.

Versailles Treaty of, The Peace Treaty 1919 ending the first world war. The first half

was devoted to the organisation of the League of Nations. Among the territorial changes Germany ceded Alsace-Lorraine to France, Posen and the Corridor to Poland. Germany undertook to disarm to abolish universal military service to keep only a small army of 100 000 and a small navy. Her colonies were to be shared out among the Allies under League Mandates. Reparations were to be paid but were gradually reduced and entirely ceased in 1932. Hitler took unilateral action against the Treaty especially in regard to rearmament and the annexation of Austria. Hitler's attempt to change the eastern frontiers was the immediate cause of the Second World War.

Victoria and Albert Museum in Kensington London was begun in 1852 as the Museum of Ornamental Art at Marlborough House. The present building was completed in 1909 and has the following nine departments: Architecture and Sculpture, Ceramics, Engraving, Illustration and Design, Metalwork, Paintings, Woodwork, Textiles, Library (of books on art) and Book production, and the Dept. of Circulation. The Bethnal Green Museum is a branch of the V and A.

Victoria Cross, an order of merit for conspicuous valour awarded to members of the Army, Navy and Air Force was established in 1856. In July 1959 it was announced that all holders of the VC for whom the British Government is responsible would receive a tax free annuity of £100.

Vienna Congress, sat at Vienna from Sept 1814 to June 1815 and settled the delimitation of the territories of the various European nations after the defeat of Napoleon. The Treaty of Vienna which resulted gave Cayenne, Mauritius, Cape Colony, Heligoland, Malta, and part of Guiana to England. France was not permitted to hold more territory than she had possessed at the outbreak of the Revolution in 1789. Austria took Northern Italy, Russia part of Poland and Prussia part of Saxony and the Rhenish province. Except for one or two changes the clauses of the treaty were maintained for over forty years.

Viet Minh, the Indo-Chinese (Annamite) national movement led by Ho Chi Minh which resisted French rule from 1945 to 1954 when Vietnam was partitioned as a result of the Geneva Conference. The National Liberation Front of South Vietnam is the political arm of the Viet Cong.

Vikings, Scandinavian pirates who from the 8th to the 10th cent. were the terror of northern waters. Sometimes the Viking raids reached south to the Mediterranean and east to the White Sea. Their leader Rurik founded the first Russian kingdom of Novgorod in A.D. 862. The Icelandic Vikings under Eric the Red discovered Greenland in A.D. 982 and a warm period in world climate allowed many to settle there. Their expeditions took them to Labrador and Newfoundland. The Vikings excelled in shipbuilding, were fine sailors and splendid craftsmen.

Vinegar, this condiment and preservative is a weak solution of acetic acid (8-9%) formed by the oxidation of ethyl alcohol by the action of bacteria on alcoholic liquor (wine, beer, cider, fermented fruit juices, or malted cereals). Wine vinegar is usually red, malt vinegar is brown. The name vinegar is derived from the Latin *vinum acre* bad wine. See also Acetic Acid.

Vinyl Plastics are polymers made from derivatives of ethylene, examples are polyvinyl chloride (PVC) which is used in making plastic pipes and kitchen utensils, among other things, polyvinyl acetate used in the paint industry and in bonding laminated articles like plywood and polystyrene (polyvinyl benzene) used in making electrical fittings and for lenses.

Viper, a family of poisonous snakes of which there is one example in Britain, the common viper or adder only found in very dry localities. See P7 F28(3).

Visibility is defined by the distance at which the farthest of a series of objects, specially selected to show against the skyline or in road contrast with their background can be distinguished. Visibility depends chiefly upon the concentration of water or dust particles

suspended in the air. Instruments are available to measure the obscenity of the atmosphere more directly including that at night. A large lapse rate of temperature and a strong wind are favourable to good visibility, a small lapse rate, calm or light wind favourable to bad visibility. Fog is when the visibility is less than 1,100 yds, mist or haze when it is between 1,100 and 2,200 yds. See Pollution.

Viscount, a title of rank coming between that of Earl and Baron. The title originally stood for deputy earl. The first English Viscount was Viscount Beaumont created in 1440.

Vitamins, name of a group of organic substances found in relatively minute amounts in certain foodstuffs essential for growth and the maintenance of normal bodily structure and function. The Hungarian biochemist Szent Györgyi who first isolated vitamin C or ascorbic acid, defined the vitamin as a substance that makes you ill if you don't eat it! See F27(1).

Volcanoes are vents through which magma reaches the surface as lava flows or as the solid products e.g. ashes and bombs of explosive eruption. The vent may be cylindrical or it may be a long fissure. The former type usually builds up cones e.g. Vesuvius. Notable active volcanoes are Etna, Vesuvius and Stromboli in Italy, Hekla in Iceland and Mont Pelée in Martinique. The last named was in violent eruption in 1902 when the chief town of St. Pierre was completely destroyed. Volcanic eruptions are sometimes linked with brilliant sunset phenomena e.g. the Pacific island of Kralakoa (1838) whose atmospheric and tidal effects were recorded all over the world and Agung on the island of Bali (1963) which had been dormant for 120 years. A new fissure volcano (Surtsey) developed off the coast of Iceland in 1963.

Vole, There are three species of British vole, the Field-vole, the Bank vole, and the Water vole.

Volt, the electromotive force unit named after Alessandro Volta (1745-1827) and defined in terms of the coulomb, the second and the joule.

Vraic, a name for seaweed in the Channel Islands where it is extensively used as a manure.

Vulgate, a term used to designate the Latin version of the Scriptures sanctioned by the Council of Trent. The work of St Jerome in the late 4th cent. A.D. and still the official Bible of the Roman Catholic Church.

Vulture, a famous bird of prey of two distinctive groups, that of the Old World whose nostrils are separated by a bony partition, and the New World vulture which has no such division. Vultures feed on carrion and are the great scavengers of tropical regions. The European species are the Egyptian vulture, Griffon vulture, Black vulture and Bearded vulture. Vultures have no feathers on the head and neck.

W

Wading Birds *Charadriiformes* an order of migratory long-legged long billed birds frequenting marshes and shallow waters. They include the plovers, avocets, stilts, oystercatchers, curlews, phalaropes, godwits, dunlins, sandpipers, red shanks, greenshanks, snipe, woodcocks, the pratincoles of the Mediterranean, and the sun bitters of tropical America. Many species breed in Britain.

Wagtails, familiar long tailed small birds, the most common British species being the Pied or Water (with sub-species White) Grey and the Yellow (sub-species Blue). Wagtails nest in holes and are active of habit.

Wallons, name given to the French-speaking population of the southern provinces of Belgium in contrast to the Flemings or Dutch-speaking population of the northern provinces. The Walloon areas contain the mining and heavy industries of the country, the Flemish regions are more agricultural. Wallons number c. 3 million, Flemings c. 5 million. The *Mouvement Populaire Wallon* desires an autonomous Wallonia within the Belgian state.

Walpurgis Night, the night before May 1st, when witches and creatures of evil are supposed to have liberty to roam. Named after St. Wal-

pursues an English nun who went on a mission to Germany in the 8th cent

Walrus a very large marine mammal related to the seals having in the upper jaw two large curved tusks which average in length from 15 in to 2 ft It lives on bi valve molluscs and inhabits the Arctic seas An adult walrus can exceed 12 ft in length and weigh over a ton.

Wapentake the ancient name given in the northern counties to territorial divisions corresponding to the Hundreds of southern counties

Warblers, a family of small lively song birds closely related to the flycatchers and thrushes Represented in Britain by about 36 species including the chiffchaff one of the earliest spring visitors willow wren wood warbler blackcap garden warbler whitethroats sedge and grasshopper warbler

Water is the simplest compound of hydrogen and oxygen It is formed when an electric spark is passed through a mixture of the gases and is a product of combustion of all hydrogens containing compounds *e.g.* petrol coal coal gas and wood Water is essential to living matter and is the medium which carries food to animals and plants Salts in hard water may be removed by distillation of the water or by a process known as ion exchange (water softening) Pure water freezes at 0° C and boils at 100° C and is used as a standard of temperature on this scale It has a maximum density at 4° C Heating water above 100° C converts it into steam which is used under pressure to convert heat energy into useful work as in electrical power stations and steam engines Water gas is a mixture mainly of carbon monoxide and hydrogen formed by blowing steam and oxygen through red hot coke it is used as a fuel Water is one of the very few compounds which freezes from the surface down rather than from the bulk of the liquid up This property has important consequences on the preservation of life in rivers and lakes when they are frozen over See also F23

Water Hyacinth (*Eichhornia crassipes*) a beautiful aquatic plant native to Brazil which has spread to other favourable equatorial regions of the world causing havoc on account of its abnormal rate of reproduction away from its natural environment In recent years it has invaded the Nile and the Congo forming vast floating carpets which block the channels clog the paddles of river craft and deoxygenate the water killing the fish It is being held in check by spraying with the herbicide 2,4-D

Waterloo Battle of was fought on June 18th, 1815 The Allies (British German and Dutch) under Wellington and Blücher defeated the French under Napoleon This ended Napoleon's career

Waterloo Bridge, crossing the Thames was built by Rennie and opened in 1817 It had nine arches each of 120 ft span was built of granite and had a length (including approaches) of 2,460 ft The present bridge completed in 1942 and formally opened Dec 10 1945 is a fine example of reinforced concrete construction (Architect Sir Giles Gilbert Scott)

Water Spider, an interesting little animal which spins a sac of silk on a water plant which it uses as a sort of diving bell Into this bell it introduces bubbles of air one at a time thus the spider is enabled to remain below the surface a considerable time

Waterspout whirling tornado like cloud occurring at sea. It begins as a cone of cloud tapering slowly downwards the sea surface becoming disturbed on reaching the centre of the cloud of spray the spout takes on the appearance of a column of water A number of these vortices may form fairly close together at about the same time, their duration ranging up to 30 minutes

Wating Street the name of the old Roman road which ran from the Channel ports by way of London to Shropshire. See also Roman Roads

Watt. A unit of electrical power equivalent to 1 joule of work per second named after James Watt (1736-1819)

Wax the name applied to certain substances or mixtures which are solids having little crystalline form and may be regarded as solidified oils. They are used for various purposes, such as the making of wax candles, bleaching and making artificial flowers and anatomical models also in

pharmacy for blending in the composition of plasters ointment etc The best known natural wax is beeswax and there are others such as spermaceti obtained from the sperm whale and Chinese wax which is a cerotyl cerotite

Waxbill a small Oriental and African bird of the *Estrildidae* family with wax like bill and beautifully variegated plumage The Java sparrow and the Blue breasted waxbill are attractive and often find their way into cages

Wayz Goose the name given to a festive gathering of people employed in printing and other works so called from the fact that in earlier times a goose was the principal dish of the feast

Weasel A carnivore mammal found in Britain smallest member of the group including the Stoat Polecat and Pine marten about 8 in long Its fur is reddish on the upper side of the animal white on the under side it may all turn white in winter with the exception of the tail

Weather the factors determining tomorrow's weather are so manifold variable and complex that the task of the meteorologist is no easy one There are still people who cling to the idea that weather is determined by the phase of the moon but their predictions have no scientific backing and can be dismissed Changes in temperature humidity and speed of air masses can best be measured by instruments designed for the purpose By taking into account the peculiar character of any part of the country whether coastal high or low lying in dustrial sheltered precise forecasts for that particular region can be made up to twenty four hours ahead and sometimes longer We need to know more about the heat exchange between oceans and the atmosphere before long range forecasting is possible The British Isles lie in the path of depressions moving north eastward across the Atlantic It is the frequency intensity and speed of these centres of low pressure which give these islands such changeable weather On the other hand when an anti cyclone builds up and embraces the British Isles settled weather is fairly certain the type of weather whether dull or cloudless warm or cold depending mainly on the direction of the wind in the particular area concerned and the time of year An American earth satellite *Vanguard II* was launched in Feb 1960 to serve as the first weather eye in space

Weather Lore Before instruments were invented to measure atmospheric conditions man relied on his own observation of wind and sky behaviour of birds and animals and came to associate certain phenomena with types of weather Many popular weather rhymes have survived the centuries and as long as forecasting is confined to the next 24 hours there is perhaps something to be said for them partly for those dealing with the winds What is very unlikely is that next year a summer can be predicted from this year's winter or that one month's weather is related to that of another The study of past records reveals too many exceptions for such predictions to be of much use in forecasting

Weaver Bird, the popular name for a large group of finch like birds belonging to the family *Ploceidae* found principally in Africa but also in Southern Asia Australia and Europe and remarkable for their habit of building nests formed of blades of grass dexterously interwoven and suspended from the boughs of trees. **Weaving** has been practised since before any times of which we have record The Egyptians credit the invention to Isis the Greeks to Minerva The main principle of the weaving loom is the same to day as it was thousands of years ago a warp extends lengthwise through the loom the threads being held in separate regular order by being passed through a reed or slay while the weft is crossed through alternating threads of the warp by means of a shuttle which holds the weft Thus the fabric is built up Weaving was done by hand up to the early part of the 19th cent when Cartwright's steam power loom was introduced, and is now in universal use The Jacquard loom for weaving figured designs dates from 1801

Wedding Anniversaries are first Cotton second Paper third Leather fourth Fruit and Flower fifth, Wooden sixth Sugar seventh

Woolen eighth Salt ninth Copper tenth Tin twelfth Silk and Fine Linen fifteenth Crystal twentieth China twenty fifth Silver thirtieth Pearl thirty fifth Coral fortieth Ruby fiftieth Golden sixtieth Diamond sixty fifth Blue Sapphire seventieth Platinum

Wednesday the 4th day of the week derived its name from Woden or Odin the Norse god of war

Weights and Measures See Section N
Welding is a means of joining together two pieces of material often metals by heating the joint until the substances melt locally run together and then solidify The heating can be by burning gas (e.g. oxy acetylene welding) or electric current (electric arc welding) Techniques exist for welding anything from hair like wires to massive steel plates See Soldering

Werewolf a man or woman, who according to mediaeval belief could be turned by witchcraft or magic into a wolf eat human flesh or drink human blood and turn into himself again This belief was widely held in Europe and similar superstitions prevail among most primitive peoples e.g. the leopard man of certain African tribes Lycanthropy (from Gr = wolf man) is a form of madness in which the patient imagines himself a beast

Westminster Abbey stands on the site of an old church and Benedictine foundation of the 7th cent It was rebuilt under Edward the Confessor and again under Henry III and important additions were made by Edward II Edward III Richard II Richard III and Henry VII the latter erecting the beautiful eastern chapel in the perpendicular style which bears his name The western towers and front were rebuilt by Wren in the 18th cent It contains tombs of many sovereigns, of the Unknown Warrior and many other illustrious men are commemorated by monuments

Westminster Cathedral seat of the Roman Catholic Archbishop of Westminster It was designed by J F Bentley and built between 1895 and 1910 It is of red brick in early Christian Byzantine style with a domed campanile 283 ft high and a decorative interior

Westminster Hall, adjoining the Houses of Parliament was built as a Banqueting Hall by William Rufus and many courtly festivals were held there in succeeding centuries King John established the Law Courts there It now forms a gigantic hallway leading to the Houses of Parliament Charles I Sir Thomas More and Warren Hastings were tried there

Whale a completely aquatic mammal the fore limbs are modified to form fin like paddles and there is virtually no external trace of the hind limbs There are two major groups of whales—the *Toothed Whales* including the Sperm whale (Cachalot) Dolphins Killer whales and Porpoises and the *Whalebone Whales* In the latter a series of whalebone plates grow down from the roof of the mouth and being frayed at their edges into a hairy fringe together constitute a filtering mechanism The animal takes in sea water containing minute organisms on which it feeds the mouth is then closed and the tongue raised when the water is forced out through the filter on which is left the food As the tongue is lowered the whalebone plates straighten up flicking the food on to the tongue which transfers it to the gut Most whale oil is obtained from the thick layer of fat under the skin (blubber) but in the Sperm whale there is a large reserve of oil in the head The oil is used for making candles margarine and soap Ambergris used in perfumery comes from the intestine of whales The number of whales that may be killed in a season is limited by International Convention

Whimbrel, a bird of the Curlew family more common in Scotland than in England

Whinchat, a small migratory bird a breeding visitor to Britain (Apr to Oct) bright brown plumage with prominent eye stripe

Whirlwind, a sudden circular rush of opposing winds which often causes much damage

Whiskers in physics and materials science (*q.v.*) are tiny rods of crystal thinner than human hair and perhaps half an inch long Their importance lies in the fact that such crystals are free from the defects described on F18 They are

also free from surface cracks and steps This means they are unusually strong because failures of strength in ordinary solids are due to imperfections and cracks of one kind or another Large numbers of whiskers of strong solids like graphite silicon or silicon carbide embedded in a matrix of softer matter such as plastic or metal would make a very strong new material Many laboratories are developing such substances

Whisky an ardent spirit distilled from malt or other grain, and containing a large percentage of alcohol It has a greater consumption than any other spirit and is of many kinds Scotch and Irish whiskies being chiefly consumed in this country and being of pot still or patent still production or a blend of the two Whisky is the most heavily taxed product in 1661 a duty of 4d a gallon was imposed, today (1970) the duty is £19 1s 1d on a proof gallon American whiskies are mostly distilled from corn (maize) or rye See Alcohol

White Elephant a term in common use to designate a gift that causes the recipient more trouble or cost than it is worth derived from an old time custom of the Kings of Siam who presented a white elephant to a courtier whom it was desired to ruin

Whitehall Palace built within sight of Westminster by Hubert de Burgh Earl of Kent round about 1240 was the residence of the Archbishops of York until Wolsey presented it to Henry VIII in 1530 Thence forward to 1697 when it was burned down it continued to be the favourite town residence of royalty and to the Stuarts especially it was a great centre of court festivities In those days with its grounds it extended from the Strand to the river The only portion of Whitehall Palace now standing is the Banqueting Hall built by Inigo Jones on a scaffold projected from the front of which Charles I was beheaded A block of new government buildings has recently been built on part of the site of the old Palace

White House the official residence at Washington of the President of the United States

Whitsuntide the festival celebrating the descent of the Holy Ghost and occurring seven weeks after Easter

Whydah bird, the widow bird of Equatorial Africa. The Paradise Whydah is remarkable for the long tail and handsome black and scarlet plumage of the male during mating season.

Widow Bird, certain species of African weaver birds with predominantly black plumage In the breeding season the male birds are strikingly beautiful with scarlet and buff markings and long tail feathers They are social parasites and trick other birds into rearing their young

Wigeon a surface-feeding duck of northern Europe known in Britain more as a winter visitor than a nesting bird. It feeds in flocks in the muddy estuaries and has a characteristic whee-oo call

Willow a water side-loving tree of the genus *Salix*, to which the osiers belong The best cricket-bat blades are made from a white willow *S. alba* var *caerulea* a fine tree with bluish green leaves, mostly found in Essex. Willow is also used for polo balls Weeping willow *S. babingtoniana* is native to China and is the willow seen on Old China willow pattern plates It was introduced into England at the end of the 17th cent

Wind, air set in motion by special atmospheric conditions is of various degrees, from a slight rustling breeze to a hurricane. Winds are constant as in trade winds or anti trade winds periodic as in monsoons and other wind visitations occurring according to influences of season cyclonic and anti cyclonic when their motion is spiral whirlwinds hurricanes and tornados when high temperature and great density induce extreme agitation Ordinarily a wind is named from the point of the compass from which it blows or it may be expressed in degrees from true north The *sirocco*, the *maistrail* and the *sirocco* are local forms of winds of great velocity A *bizzard* is a biting blast of icy temperature See also Section N

Windmills were in use in the East in ancient times but were not much seen in Europe before the 13th cent Wind sawmills were invented by a Dutchman in the 17th cent and one was erected

near the Strand in London in 1633. Great improvements have been made in these mills especially in the United States where by the application of the wandshaft principle much space is saved and the mills can be used for pumping, grinding and other purposes.

Windows (Old Norse *vindauga* = wind eye) an opening in a wall of a building to admit light and air and to afford a view of what is outside. In northern Europe windows as the derivation of the word implies were first used for ventilation and glass was not used in private houses before the end of the 12th cent. In early Gothic (12th cent.) windows were still small and narrow with rounded heads. In Early English (15th cent.) they became longer and the heads pointed. In the Decorated period (14th cent.) windows were mullioned (divided by slender bars into panes) and the pointed heads often traceried. In Tudor times when the Renaissance had found its way to England windows were larger and the bay window (projecting from the wall) and the oriel window (*qv*) were much in vogue in the late 16th and 17th cent. bays (called bow windows) became fashionable. Sash windows (invented by the English) with wooden frames and divided into equal rectangular panes were used in Queen Anne and Georgian houses. Their design was influenced by a passion for symmetry: they were very efficient ventilators. The French window reaches to the floor and has double casements opening as doors. A Dormer window is a vertical window set on the sloping side of a roof. One of the main features of modern architecture is the large area devoted to windows; a development made possible by improved heating systems. Windows are now mass produced in stock sizes and patterns.

Windsor Castle the famous British royal residence on the banks of the Thames as it now stands was mainly built by Henry III, though a royal residence had existed there from the time of the Conqueror. Additions were made by Henry VIII, Elizabeth, and Charles II. Windsor Park and Forest comprise over 18,000 acres.

Wine, the fermented juice of the freshly gathered grape. There are innumerable varieties each obtaining its distinctive character from the species of wine producing the grape, the locality of the vineyard, method of cultivation, etc. Wines are of three main kinds: *sparkling* as in champagne due to their having been bottled before fermentation is complete; *beverage* when the must has been fermented out before bottling. Such wines include the famous red and white wines of Burgundy, Bordeaux and the Rhone valley and the white wines of the Rhine, Moselle and Loire valleys. Wines are *fortified* by the addition of alcohol either after fermentation is complete (*eg* Sherry) or during fermentation (*eg* Port). The principal wine-producing countries are France, Italy, Algeria, Spain, Portugal, Rumania, Argentine, Yugoslavia, U.S.S.R., Greece, Germany, Hungary.

Winebird, a species of plover confined to St Helena where it is protected.

Witan or Witenagemot, the name given to the king's council of wise men in Anglo-Saxon times composed of the archbishops, bishops, abbots of the greater abbeys, ealdormen and influential thanes.

Witchcraft See J58.

Wood, a plant (*Taxus (bicolor)*) that in olden days was largely used in England for the blue dye obtained from the leaves. It is a biennial plant belonging to the same family (*Cruciferae*) as the wallflower and is still cultivated in some parts.

Wolves well known carnivorous animals still found in many parts of Europe but not existing in Britain since the middle of the 17th cent. They usually hunt in packs.

Women's Liberation Movement See J53.

Woodcock, a wading bird, greatly valued for its flesh. It is a member of the snipe family, and breeds in Britain. The parent bird is able to carry its young between its thigh and body when flying to and from the feeding spots. It is one of the birds protected by the Game Laws.

Woodpecker, a familiar tree-climbing insectivorous bird of conspicuous plumage, of which three species are found in Britain, the green

woodpecker or yaffle (because of its harsh cry) the great and lesser spotted woodpeckers. They build in the hollows of trees. Yaffle has a long sticky tongue for hooking up ground insects especially ants. The other two obtain insects by digging into tree trunks with strong chisel-like bills spearing the insects with a sharp tongue. The metallic drumming sound made by the birds in spring is thought to be caused by their beaks hammering away at some hard resonating substance.

Wood's Metal an alloy with a very low melting point (35°C which is under 150°F) so that a spoon made of it will melt when used to stir a cup of tea. Contains bismuth 4 parts, lead 2 parts, tin 1 part, cadmium 1 part. Its use as a heat exchanger has now been largely superseded by silicone oils which have a wider temperature range.

Woodworm Four beetles are mainly responsible for woodworm damage: common furniture beetle (*Anobium punctatum*), powder post beetle (*Lyctus brunneus*), death watch beetle (*Xestus trem rufosellatus*) and house longhorn beetle (*Hyloterpes baxteri*). Particular attention should be paid to wood in damp dark, and out of the way places and the backs and underneath of furniture. The most frequent cause of woodworm damage is the common furniture beetle (*qv*).

Wool is a fibre made up of very long protein molecules. It has been largely grown and used in the manufacture of cloth in England since before the Roman invasion. It is grown on the backs of sheep, and is of various kinds according to the breed of sheep from which it is derived. Wool differs from hair in that it has a wavy serrated fibre its curl being a notable characteristic whereas hair has a smooth surface comparatively free from serratures. Long wools are mostly used for the manufacture of worsted goods and short wools for woollen cloths though the improvements in machinery in recent years have enabled manufacturers to utilise short wools to a great extent for dress fabrics as well as for woollens. The finest wools are obtained from the fleece of the Spanish merino sheep. Australia, New Zealand and the Argentine are the greatest wool producing countries.

Woolsack, the name given to the seat occupied by the Lord Chancellor in the House of Lords. It is a large square bag of wool without back or arms covered with red cloth. At the time when it was first used in the reign of Edward III wool was the great staple commodity of the country and it is said, chosen for the seat of judges as a constant reminder of the main source of the national wealth. The Lord Chancellor is said to be appointed to the woolsack.

World Council of Churches. See J58.

World Population. According to United Nations sources world population is expected to rise from an estimated 3 632 million in 1970 to an estimated 4 457 million in 1980 (3 247 million in the underdeveloped regions and 1 210 million in advanced countries). Thus nearly three quarters live in the poor countries half in Asia. Different countries are at different stages in a demographic transition from the stability provided by a combination of high birth rate and high death rate to that provided by a combination of low birth rate and low death rate. Their recent population history and current trend of growth the age structure of their population and consequently their population potential for the near future are all widely different. By the beginning of the Christian era world population is believed to have been 200-300 million, rising to about 500 million by 1860 and it is estimated that about one in 25 of all human beings who have ever lived are alive today.

Wreck the name given to a vessel found under water usually from a maritime wreck. Finds must be brought to the notice of the Official Receiver of Wrecks an officer of H.M. Customs and Excise.

Wren a family of small passerine birds possessing upturned tails and most abundant in South America. The British species is an interesting singing bird with a surprisingly loud note for its size.

X

Xenon a rare gaseous element symbol Xe occur ring in minute quantities in the atmosphere discovered by Sir William Ramsay and M W Travers in 1898. See Rare Gases

X Rays were discovered in 1895 by Professor Röntgen of Würzburg while experimenting with a Crookes vacuum tube when the fact was accidentally revealed that a photographic plate contained in a dark box and exposed to its rays was affected. To the X rays the box was transparent. X ray photographs are now commonly taken to obtain information about objects enclosed within solid bodies they enable bullets and any solid bodies of metal as well as bones etc. in the body to be perfectly located and investigated. The discovery has proved of great advantage in surgical operations. X rays are used to determine the structure of matter the atoms in a substance may be located and their relative positions determined by photographing reflections of the X rays by the specimen. See F11(1)

Xylem the woody tissue of higher plants whose function is to conduct water and mineral salts upwards and to provide mechanical support

Y

Yacht a light vessel now much used for pleasure trips and racing. The first yachting club was the Cork Harbour Club started about 1720 and in 1812 the Royal Yacht Squadron was founded at Cowes. The Royal Thames Yacht Club dates from 1825. The most famous international yachting trophy is *The America's Cup* (q. v.). See also U32

Yak, a curious long haired or found in Tibet used as a beast of burden and also kept for milk and meat.

Yard a standard measure of 36 in the word being derived from the Saxon *gyrd* or rod. The yard and pound are now defined by reference to the metre and the kilogramme. yard = 0.9144 of a metre. pound = 0.45359237 of a kilogramme. By international agreement the metre is defined by reference to the wavelength of Krypton 86 light.

Yellowhammer a common British bird of the buntings family of lemon yellow and brown plumage. Nests on or near the ground.

Yeomen of the Guard are a body of Foot Guards established in the reign of Henry VII for the protection of the Royal Person. Yeomen are now about 100 in number and their duties consist in being present on ceremonial State occasions the yearly distribution of Maundy Money and the searching of the vaults of the Houses of Parliament on Guy Fawkes' day. Beefeater is the nickname of both Yeomen of the Guard and Yeomen Warders of the Tower and they both wear the style of dress of the Tudor period, but with one distinction, the Yeomen of the Guard wear a cross belt, the Warders do not.

Yeti, opinions differ as to whether this is a mythical inhabitant of the Himalayas a primitive primate or bear. Evidence to date is inconclusive.

Yoga. See J53

York Minster one of the oldest and finest of English cathedrals, is 524 ft long its nave is 240 ft broad, and the central tower is 210 ft high. The present edifice in parts dates back to the 12th cent. but a church stood on the site in the 7th cent. In 1520 it was set on fire by a lunatic named Jonathan Martin, and the destruction that then took place cost £60 000 to restore.

Ytterbium, a chemical element discovered by Urbain in 1907, one of the group of rare earth metals.

Yttrium, a chemical element discovered by Mosander in 1842. It is found in a few rare minerals such as gadolinite, xenotime, fergusonite and euxenite. One of the group of rare-earth metals.

Z

Zamboni Pile, a dry galvanic battery which can

provide small amounts of high voltage current over a very long time. At Oxford a couple of Zamboni piles have kept a bell ringing for over a hundred years. These piles in the second world war were perfected and produced in quantity being the most convenient source of current for infra red signalling devices.

Zebra, an African quadruped of whitish grey colour with regular black stripings perhaps the most beautiful member of the Equine family. Rather larger than an ass and smaller than the horse it has a tufted tail is of light build wild and fleet of foot. The Zebra is threatened with extinction—already the fate of the Quagga species—because of its slaughter by man for its beautiful skin.

Zen Buddhism. See J54

Zenith the highest point in the heavens above an observer's head the opposite pole to the Nadir.

Zero the cypher signifying nothing. The West is indebted to the Arabs for it who probably got it from the Hindus and passed it to European mathematicians towards the end of the Middle Ages. The zero has also been found in Baby lonian cuneiform. The Greeks had no such symbol which hindered the development of their mathematics. The use of zero led to the invention of decimal fractions and to the later developments in astronomy physics and chemistry. For absolute zero on the temperature scale see L2.

Zinc a familiar metallic element symbol Zn known to the ancients and used by them in the making of brass. It occurs as the sulphide carbonate etc. The ores of zinc are crushed roasted and reduced with coal. In combination with copper it constitutes the familiar alloy called brass and zinc itself is much used for roofing and other protective purposes. Zinc ores are mined in Canada, the U.S.A., Mexico, Poland, Australia, Russia, Italy, Spain and many other parts of the world. Zinc smelting is carried on in most industrial countries, including Great Britain.

Zionism. See J54.

Zirconium metallic element symbol Zr was discovered by Klaproth in the sand of the rivers of Ceylon in 1789. The crystalline metal is white, soft and ductile. In its amorphous condition it is a blue black powder. Zirconium is used in atomic reactors as containers for fuel elements since it does not absorb neutrons.

Zodiac, an imaginary zone or belt of the sky enclosing the current over which the principal planets travel. It is divided into 12 equal spaces of 30 degrees each comprising respectively the 12 signs of the zodiac—Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius and Pisces. The idea of the zodiac originated with the Babylonians about 2000 B.C. and passed by way of the Greeks to the Western world.

Zodiacal Light, a faint cone of light occasionally seen stretching along the zodiac from the western horizon after evening twilight or the eastern horizon before morning twilight. It is believed to be due to the scattering of the sun's light by dust particles in orbit round the sun and extending beyond the earth. Recent observations at the high altitude station at Chacaltaya in the Andes suggest that the dust is travelling round the sun in regular planetary orbits.

Zonda, a warm moist wind in Argentina of great velocity blowing from the north or northwest and like the Sirocco in Southern Europe causes much discomfort. It happens when a depression is moving across the pampas bringing with it a mass of air from the humid tropics. It is followed by a refreshing wind from the south-east.

Zoological Gardens of London were opened in 1828 and belong to the Zoological Society of London. They contain one of the largest and most varied collections of living animals in the world. The Society maintains an open air zoo at Whipsnade, on the edge of Dunstable Downs this was opened in 1931.

Zoology the science of animal biology, treating of the structure, classification, and distribution of the various members of the animal kingdom.

Zoroastrianism. See J54.

I THE CONTEMPORARY NOVEL

This section discusses novels written in English and published since 1945. It consists of two parts: I Introduction II Directory of Novelists

We are helped to appreciate the modern novel if we understand how it evolved from that of the nineteenth century. The Introduction that follows therefore summarises some of the important characteristics of English, American and French novels of the nineteenth and early twentieth centuries and describes some of the literary and intellectual ideas that seem to have affected contemporary fiction.

It is important to remember that every worthwhile novel is an individual work of art that creates its own rules and however strange a writer's techniques or subject matter may seem we should try to suspend judgement until we have read his novel for a second or third time. Apart from the obvious difference that plays are written to be performed and novels to be read, the criteria of judgement suggested on 17 are as applicable to modern fiction as they are to contemporary drama.

INTRODUCTION

The Mid Nineteenth Century

(a) English and American Novels.

At this time English novelists were members of a comparatively secure and stable society which possessed generally accepted social and moral standards and the theme of almost all their writing is the interaction of the individual and the community. Novelists such as George Eliot, Dickens, Thackeray and Trollope depict characters who progress towards self-knowledge as they learn to discriminate between the genuine and the false, the good and the evil in the people and institutions with which they are brought into contact. Since these writers were as much concerned with the presentation of society as of individuals, most of their work contains naturalistic descriptions of the life and manners of their day and although the main characters of the Victorian novel are the focal points of its action, as Douglas Hewitt has remarked, they are not central to it in the way that the hero of a tragedy is; central the action is not orientated towards them.

Most English novels of this period are comparatively loose and episodic in structure. Narrative is chronological and most writers place themselves between the reader and the story, standing apart from the characters, observing, commenting on and judging their actions and quite often, addressing the reader directly.

A notable exception to this general pattern is *Wuthering Heights*. In both its techniques and its view of life, Emily Brontë's novel has more in common with mid-nineteenth century American fiction than with the work of her compatriots and is unique among the English novels of its day in its disregard of society and of social and moral conventions.

American novelists such as Twain, Hawthorne and Melville were interested in the presentation of individuals rather than of society. This was natural in a country inhabited by pioneers and exiles and their descendants who had no common culture. Like the heroes of tragedies, the main characters of mid-nineteenth century American novels are central to their action, isolated pioneers and exiles who create their own worlds.

American novelists used chronological narrative but they generally wrote in the first person and their techniques were in other ways different from those of most of their English contemporaries and characterised by the use of allegory and symbolism.

In both countries novelists wrote for a middle class public and like their readers they saw fiction as a mode of entertainment and of instruction. However, in France other ideas were being born which were to affect both the form and content of twentieth century English and American fiction and lead many writers to think of novels as primarily works of art.

(b) French Novels

Gautier and Aestheticism

As early as 1825 Gautier had said that a writer must concern himself only with perfecting the style and form of his work and that this was impossible if he considered the needs of society, civilization or progress. Later he wrote: 'A beautiful form is a beautiful idea implying that a novelist could treat any subject no matter how sordid or painful so long as he embodied it in a beautiful work of art.'

Flaubert and Realism

Flaubert, a leading member of the Realist school, felt that novelists must strive to be impersonal, adapting their style to their subject matter for only thus could they write realistically. He believed that it helped novelists to be objective if they based their work on scientific documentation and said: 'It is necessary to discuss the human soul with the [same] impersonality that one uses in [the study of] physical sciences.' To the public who were shocked by Flaubert's unconventional subject matter, realism became a term signifying moral disapproval.

Realistic is now used of (i) novels of working class life such as Silktree's *Saturday Night and Sunday Morning*, (ii) any frank treatment of the physical aspects of life or of painful or sordid subjects as in Mailer's *The Naked and the Dead*. Our use of the term has been influenced by Marxist theory and by the writing of the Naturalists.

Zola and Naturalism

Zola and his followers called themselves Naturalists because although they agreed with Flaubert that novelists should aim at objectivity they wanted to produce slices of life rather than works of art. Zola was stimulated by new scientific ideas and particularly interested in the effects of heredity and environment upon character. He inclined to the theory that character is largely determined by environment and wrote of the former in terms of the latter. Fascinated by the sordid side of nineteenth century life, he tended to concentrate on it to the exclusion of all else and stimulated interest in the portrayal of moral degradation, brutality and squalor. In England the National Vigilance Society waged a vigorous and unsuccessful campaign against the publication of translations of such corrupt literature.

1880-1910

This period introduced some of the most popular kinds of modern novel inspired by the

work of the Frenchman Verne, H. G. Wells began to write Science Fiction. Conrad's *Secret Agent* introduced the Spy Thriller and Conan Doyle developed the Detective Story. Invented in 1868 by Wilkie Collins.

The work of the French Naturalists was influential throughout this period but although it helped to widen the scope of the novel it found few close adherents among English or American writers who were and are more interested in those idiosyncratic aspects of personality disregarded by the Naturalists. The influence of Gautier and particularly Flaubert was more important and was first apparent in the work of James and Conrad, both of whom saw themselves as artists not teachers or entertainers. They have been called the first Modern English Novelists.

(a) Henry James (1843-1916)

James admired the work of Gautier and was much impressed by Flaubert's theory of fiction. Like Flaubert he strove towards an objective detailed presentation of character and constantly sought to depict the nuances of feeling more delicately and precisely and to give his novels greater aesthetic unity. Many twentieth century writers call James 'The Master' for the scrupulous care with which he revised and polished the style of his novels and short stories established an ideal of literary craftsmanship. The artistry and poetic sensitivity of his writing have had a marked effect upon the work of writers such as Elizabeth Bowen and Hartley. James began the process of combining the social novel of the European tradition with the more poetic American novel a process to be carried much farther by Conrad in *Nostromo*.

(b) Joseph Conrad (1857-1926)

Conrad spent his youth in France and was well read in French literature. The sense of insecurity which permeates his writing is one of the first signs in English fiction of the break up of the social and moral stability of the nineteenth century. This change appeared earlier on the Continent than in England and it is perhaps significant that Conrad was of Polish birth and always spoke French better than English but his sense of insecurity was doubtless intensified by the hazards of his early naval career in the days of sailing ships.

Like the novels of present day writers such as Beckett, Lowry and White, Conrad's books are essentially poetic and can be read on a number of different levels. They are as realistic as nineteenth century French novels, but their every detail bears a significant relation to the plight of their central characters and in his masterpiece *Nostromo* Conrad showed that a novel of great poetic intensity could yet encompass the life of a whole society.

James had been unable to banish the intrusive presence of the author from his novels. Conrad managed to at times by using a narrator who is deeply involved in the action, at others by reversing an eighteenth century technique of telling the story from shifting points of view. At the same time he abandoned chronological narrative for a shifting time sequence which reinforces his themes by intensifying a feeling of insecurity. Narrative of this kind has been used with similar effect by a number of modern novelists including Beckett, Bellow and Naipaul and although the use of the shifting time sequence which marks one of the most obvious differences between nineteenth- and twentieth-century fiction has been influenced by the writing of Proust and Joyce and by new ideas in theoretical physics and psychology, Conrad was the first novelist to use this kind of narrative.

The Early Twentieth Century

On or about December 1910 human nature changed, said Virginia Woolf. She probably

chose that date because it marked the opening of the first London exhibition of the paintings of the post-impressionists. The work of these artists expressed a new vision of reality which was characteristic of the intellectual and cultural revolution sweeping Western society in the early decades of the century. The stimulus of this new Renaissance was reflected not only in painting but in the music of Stravinsky, the dance of the Diaghilev Ballet, the poetry of Pound and Eliot and the novels of Proust, Joyce and Virginia Woolf herself. The sense of exhilaration felt at this time is vividly suggested in Leonard Woolf's autobiographical work *Beginning Again*.

The stability and formality of nineteenth century life which had already been undermined by the ideas of Darwin and Huxley, the growing literacy of the working classes and the accelerating technological revolution was now shattered by the combined impact of psychological theories, the ideas of social anthropologists such as Sir James Frazer and the work of physicists like Planck, Einstein and Rutherford (see F10-13). As a result, novelists could no longer assume that readers' attitudes and values would resemble their own and were obliged to reconsider the nature of the relationship between art and life. The exploration of this relationship becomes one of the major themes of twentieth-century fiction and after the First World War it is accompanied by an increasing sense of the isolation and insecurity of the individual, a life and the inadequacy of words as vehicles for communicating experience.

For most writers the nineteenth century European novel now seemed inadequate to express the complex and fluid nature of consciousness revealed by psychologists and narrative consisting of a simple chronological progression of events was felt to give a misleading impression of our experience of time. Novelists were therefore compelled to search for new techniques, and were encouraged to do so by the example of experiments already taking place in art and music and by the example of the French Symbolist poets.

(a) The Influence of Psychological Theories

The interest in the nature of perception revealed in the work of impressionist and post-impressionist painters had been growing since the turn of the century and was stimulated by the writings of the American William James and the Frenchman Henri Bergson.

In 1890 James, the brother of novelist Henry James, had published *Principles of Psychology* in which he compared consciousness with a 'river or a stream, implying that it carries within it submerged and floating memories and receives a fluid series of impressions of the exterior world. The term 'stream of consciousness' derived from James's theory was later applied to a new literary technique evolved by Joyce.

In *Matter and Memory* (1894) Bergson had suggested that perception is controlled by memory and said that our view of the world changes at every moment 'as though by a turn of a kaleidoscope, suggesting that perception involves an involuntary creative readjustment of elements of past experience. This idea was to have a profound effect upon the work of Proust to whom Bergson was related by marriage.

The writings of Freud which began to be published in English in 1913 drew further attention to details of human experience stimulating the growing interest in the subconscious mind in dreams and the symbolic transformation of experience and combining with the influence of the Symbolist writers and the music of Wagner to give new impetus to the use of symbolism in fiction.

The influence of Freudian theory also extended the novel's potential subject-matter in two most important ways.

By emphasising the frail barrier between rational and irrational behaviour Freud made possible an imaginative discussion of neurosis and insanity which had been regarded as shameful in the nineteenth century. The results of this more sympathetic attitude can be seen in the novels of writers such as Faulkner, Bellow and White while novels like Doris Lessing's *The Four Gated City* (1969) (q.v.) and Jennifer Dawson's *The Ha Ha* (1961) an imaginative study of a schizophrenic are inconceivable as the work of any pre-Freudian writer.

Perhaps the most influential of all Freud's theories was his suggestion that our attitudes and behaviour are determined primarily by sexual needs and experience. Nineteenth-century novelists had been extremely reserved in their treatment of sexual life and although eighteenth-century writers had been uninhibited they had regarded erotic experience either as merely incidental to their characters' lives or as a subject for ribald comedy and satire. Freudian theories have encouraged modern novelists to treat sexual experience more freely than it was in the nineteenth century and more imaginatively and seriously than it had been by earlier writers. Indeed it is now unusual for a novelist to treat sex humorously!

Freud's ideas on infantile sexuality also aroused enormous interest in childhood experience and relationships between parents and children, particularly in the ways that these might later affect the adult. Novelists whose work reflects this interest include Ivy Compton Burnett, Hurtle Styrton and Wilson.

It is interesting to note that despite the influence of Freud and later psychologists and writers such as Kinsey it is only within the last decade that English public opinion has allowed novelists to treat erotic love and sexual deviation as frankly as eighteenth-century writers could. An important date in the restriction of censorship came in 1960 when Penguin Books won their case for the publication of an unexpurgated edition of Lawrence's *Lady Chatterley's Lover*.

b) The Influence of the Symbolists See also M22-3

The work and ideas of the writers associated with this school which arose in France in the last decades of the nineteenth century and included the poets Rimbaud and Mallarmé have had a far-reaching effect upon modern fiction.

The Symbolists' technical experiments in using verbal association, deliberate ambiguities of phrase and syntax, multiple analogies and esoteric allusion in poetry and interior monologue in fiction suggested means by which modern novelists might attempt to express the subtleties of individual consciousness and to create new forms of novel. The Symbolists' feeling that artists are gifted with a mystical apprehension of Reality and their consequent belief that in order to express this apprehension art should possess the evocative lyrical qualities of music not only helped novelists like Proust and Joyce to evolve new forms for the novel but has had a less happy influence on some other writers encouraging them to indulge in vague metaphysical musings. Two gifted novelists whose work seems to have suffered in this way are the Austrian Hermann Broch and a writer from Guyana, Wilson Harris, both of whose novels are at times highly evocative but too often seem to degenerate into meaningless verbiage. (However, the eminent critic George Steiner suggests in *Language and Silence* that Broch's *Death of Virgil* (1945) is one of the greatest novels of the century comparable only with Joyce's *Ulysses*. Its theme is similar to that of T. S. Eliot's *Four Quartets* and like Eliot's poem it is constructed in the form of four movements each based on the key of one of the elements: earth, air, fire, and water.)

The Symbolists' dream of producing a universal poem, an epic myth on the scale of

Goethe's *Faust* has been reflected in the work of many modern novelists notably in Joyce's *Ulysses* and *Finnegans Wake*, the German Thomas Mann's *Joseph and His Brothers*, Broch's *Death of Virgil* and more recently in the novels of Beckett, Golding, Lowry, Styrton and White.

(c) The Influence of Russian Literature

A subsidiary but nevertheless important influence upon the novel has come from the writing of the great nineteenth-century Russian authors. Turgenev has been available in English since the 1890s. Tolstoy, Dostoyevsky and Chekhov began to be translated just before the First World War. Their writing heightened novelists' interest in conveying a more spiritual reality and the work of Turgenev and Chekhov particularly encouraged writers who were moving towards a more lyrical treatment of style and form while the novels of Dostoyevsky stimulated the interest aroused by Freud in the imaginative presentation of mentally handicapped, neurotic, psychotic and psychopathic characters. American and English novelists' attitudes to the work of these and other Russian authors can be studied in the anthology *Russian Literature and Modern English Fiction* edited by D. Dwyer.

(d) Innovators of Literary Techniques

Marcel Proust (1871-1922)

In his huge novel *À la recherche du temps perdu* (1913-27) Proust evokes the kaleidoscopic patterns of involuntary memory as they float through his narrator's mind. His work has therefore been called a *roman fleuve*—a river novel. Its plot seems non-existent but the novel is in fact constructed with the greatest artistry and just as the Symbolist poets used evocative images with a multiplicity of associations so Proust introduces the characters and events of his narrative presenting them from different viewpoints and investing them with new significance each time they are recalled. Proust's work had a notable influence upon the writing of Virginia Woolf and Forster and among more recent novelists Proust is Proust's avowed disciple. A translation of *À la recherche du temps perdu* is now published in paperback by Chatto and Windus.

James Joyce (1882-1941)

Joyce an Irishman spent most of his life on the Continent and although his work like that of all great artists was highly individual it owed much to the stimulus of the ideas of Flaubert and the work of the Symbolists. Like Flaubert Joyce believed that a novel should be objective and rooted in experience of everyday life and by developing the Symbolists' techniques he achieved an hitherto unparalleled impression of objectivity in his portrayal of character.

Joyce's name is particularly associated with the stream of consciousness technique which he evolved from the Symbolist writer Proust's interior monologue in order to be able to express the mind's activity—not only the way we receive passive impressions of the exterior world and associate them with past experience, the subconscious distortion and imaginative control exercised by the mind but also how our sensibility and imagination are involved in an active dialogue with the world as we apprehend it. Joyce's use of this technique therefore varies considerably according to the kind of character he is presenting and since he attempts to express non-verbal experience as well as verbal thought his sentences often have a poetic rather than a discursive logic. Stimulated by Joyce's example later novelists including Faulkner and Lowry have evolved their own poetic forms of the stream of consciousness technique but most later writers have preferred to use a less poetic version more akin to the interior monologue expressing the stream of thought rather than of consciousness. A contemporary novelist who uses interior monologue in this way is Bellow.

It has been suggested that Joyce having created a new kind of novel himself used it in every possible way. In *Portrait of the Artist* (1916) he covered the childhood and adolescence of a writer. *Ulysses* (1922) shows a day in the life of Dublin through the eyes of three people and at the same time creates a universal image of man's experience of life. In *Finnegans Wake* (1939) Joyce attempted to express the history of the world by evoking the dreams of a Dublin publican but despite its occasional brilliance *Finnegans Wake* is largely inaccessible to readers who have not spent years studying it. Joyce has therefore a twofold significance for later writers: he evolved a new kind of novel and although he wrote with such skill that others have often despaired of emulating him, his achievements have encouraged novelists to experiment while *Finnegans Wake* has provided a salutary warning of the dangers of indulging in esoteric mythmaking.

(e) Heirs of the Victorian Tradition

D. H. Lawrence (1885-1930) See also Section I

Lawrence had a vivid appreciation of the beauty of the natural world and emphasised the importance of the instinctual as opposed to the intellectual life. He felt that it was only through basic human experience, particularly through the experience of unselfish erotic love that we could attain the peaceful self-unity that comes from an apprehension of the sacramental quality of life.

Although he abhorred didactic literature Lawrence was therefore a man with a message: the flag bearer of intuition in its interminable struggle against logic and reason — a true heir of the Romantic movement (see Section J). Lawrence's attitude to the novel was thus akin to that of Victorian writers and the form of his work has much in common with theirs although unlike most Victorians he made deliberate use of poetic symbolism which as Walter Allen has said, enabled him to render the felt quality of the immediate instinctive self as it had never been before.

Although no later novelist has equalled Lawrence in the tender poetic expression of unselfish erotic love, his ideas have been widely influential. Doris Lessing is among those later novelists whose work like Lawrence's has emphasised the unhappiness and sterility of selfish relationships and the American writer Baldwin also reflects his influence.

E. M. Forster (1879-1970)

Like Lawrence Forster was a moralist primarily interested in relationships between people and used techniques and a novel form that have much in common with those of the Victorians. A much more sophisticated novelist than Lawrence Forster was superficially a writer of social comedy in the tradition of Jane Austen, but he was always aware of the numinous quality of life and expressed it in his novels through complex symbols. His books explore individuals' attempts to connect with each other across the divisions of daily life in a mutual quest for truth. These themes which are stated rather than successfully conveyed in symbolic terms in his early novels find poetic expression in his masterpiece *A Passage to India* (1924).

Forster did not publish any novels after 1924 saying 'I had been accustomed to write about the old-fashioned world with its homes and its family life and its comparative peace. All that went and though I can think about the new world I cannot write about it.'

The new world is the theme of Kafka and Huxley.

(f) Important Novelists of the 1930s

Franz Kafka (1883-1924)

A Czech by birth Kafka wrote in German. His novels first became known to the English speaking world on the appearance of a translation of *The Castle* in 1930. It was followed in 1938 by *The Trial*. These haunting parables of a man's nightmare life in a world where everything appears contingent now seem prophetic and their influence is apparent in works like Rex Warner's *The Aerodrome* (1941), Orwell's 1984, Ellison's *The Invisible Man* and the novels of Beckett. Surrealist techniques giving an effect of confusion between the world of consciousness and that of dream had been used before Kafka but he gave them fresh significance.

His tragic short story *Metamorphosis* which tells of a man who wakes one day to find himself transformed into a huge insect brought new dimensions to serious science fiction.

Aldous Huxley (1894-1963)

Huxley was unique among the novelists of the inter-war years. He declared that nothing deserved to be taken seriously save the suffering men inflict upon themselves by their own crimes and follies and he criticised both the traditional social novel of personal relationships and the more poetic individualism of Joyce. Virginia Woolf *et al.* as reflecting conventional values that create suffering and help to perpetuate misery. Although Huxley's highly intelligent satires are very different in style from those of any other twentieth century writer his themes look forward to those of some of the more important post-war novelists.

John Dos Passos (1896-1970)

Dos Passos was a member of the group of Radical American novelists which also included Farrell and Steinbeck, all of whom were influenced by the work of the Naturalists. In his trilogy *U.S.A.* (1930-36) which is a panorama of American life between 1910 and 1927, Dos Passos developed the collage techniques he had evolved in *Manhattan Transfer* (1925). The trilogy is composed of short sections, some are written in interior monologue, others consist of extracts from newspaper headlines and articles and snatches of popular songs, others are biographies of leading American personalities written in a kind of free verse, and yet others consist of extracts from the lives of fictional characters. *U.S.A.* does not form an imaginative whole and has nothing of the power of Proust and Joyce's novels but Dos Passos's technical experiments have exerted considerable influence not only on a number of later American novelists particularly Mailer but also on French writers such as Sartre.

Recent Developments

(a) Commonwealth Writers.

Since 1945 the language of the English novel has been invigorated by the work of writers from the Commonwealth. Outstanding among these novelists are Achebe and Soyinka from Nigeria and Naipaul from Trinidad (qqv). Drawing upon a long tradition of oral story telling these and other African and Caribbean writers are particularly skilful in their treatment of dialogue. Notable authors from the Indian subcontinent include R. K. Narayan and Zulfikar Ghose while the Australian Patrick White (qv) is one of the greatest of contemporary novelists in any language.

Heinemann's have recently introduced a highly recommended inexpensive series of editions of African Commonwealth fiction.

(b) Le Nouveau Roman.

Some critics consider the most exciting recent developments in the novel's form have been made

in France by the heterogeneous group of writers whose work is given the title of *le nouveau roman*. Most of their novels are published by Éditions de Minuit, of which Robbe-Grillet, one of their leaders, is a director, and are available in English translation from Calder and Boyars.

Apart from Robbe-Grillet the most notable of these novelists include Butor and Nathalie Sarraute. Some of their theories about fiction are to be found in Robbe-Grillet's *For a New Novel*. Butor's *The Inventory* and Sarraute's *The Age of Suspicion*. Interested readers should also refer to *Writing Degree Zero: Mythologies and S/Z* by the influential critic and linguistic philosopher Roland Barthes.

Although the writers of the *nouveau roman* have individual styles, all seek to present a character's state of mind over a brief period of time while introducing incidental details of his past experience. Their techniques involve the inconsequential repetition of key images and phrases in ever differing combinations and contexts. Such aims may seem new to the French literary scene but they are familiar to English readers of the eighteenth-century Laurence Sterne to his *Tristram Shandy* (1760-7). The techniques of the *nouveau roman* derived from the Symbolists, Joyce and Proust, are not really new either and although skilfully deployed often mask the trivial content of works which have nothing of the power of Samuel Beckett's fables (*qqv*) their immediate inspiration.

The only English novelist closely associated with this French group is Christine Brooke Rose (*qqv*). The experimental writer B. S. Johnson (*qqv*) has expressed similar aims to those of authors of the *nouveau roman* but his novels are very different from theirs.

Conclusion

Contemporary novelists writing in English are experimenting with a variety of forms continuing to use and adapt the techniques evolved by writers in the early part of the century and in general their better work approaches more closely to that of the nineteenth-century American tradition than to that of the Victorian novel. This means that although the novel has gained in dramatic and poetic intensity its vision of the world has generally been restricted to that of one or a few characters. This may partly be a result of the interest in individual experience aroused by psychologists but it seems more particularly a reflection of life in the contemporary world in which many men feel exiles. Most modern art not only fiction expresses feelings of isolation, bewilderment and suffering and not only rebellious students, but eminent thinkers such as Tillich have suggested that life for many people in Western society is virtually little different from that under a totalitarian régime. It is significant that such a view of contemporary life was foreshadowed by Kafka, and Huxley and is now reflected most impressively because it is expressed poetically in the grimly comic novels of Beckett.

In 1968 and 1969 however new ways of expressing the dilemmas of contemporary life were suggested. In *The Armies of the Night* (*qqv*) the American Mailer following a pattern suggested by 'Theatre of Fact' (see I3) produced a fascinating documentary novel on the American anti-Vietnam War lobby, and from Russia came *Cancer Ward* and *First Circle* two painful yet essentially hopeful novels by Alexander Solzhenitsyn, winner of the 1970 Nobel prize.

II DIRECTORY OF NOVELISTS

In this part we discuss the work of some of the more important novelists who have published since 1945. It is inevitably selective. A more

detailed treatment of the twentieth-century American and English novel may be found in Walter Allen's *Tradition and Dream* (P). Some helpful studies of individual authors are available in Oliver and Boyd's paperbacked series *Writers and Their Critics*.

Except for the later novels of Beckett, dates quoted are those of the first publication. The dates of the first English language editions of Beckett's novels are given.

Paperback editions are referred to thus:

Chinua Achebe (b 1930)

Achebe the Nigerian author of four most elegantly written novels was awarded the first *New Statesman* prize for African and Caribbean writers in 1965.

Things Fall Apart 1958 *No Longer at Ease* 1960 *Arrow of God* 1964

These novels are all concerned with the impact of Western society upon Ibo culture in earlier years of the century. Achebe shows a vivid appreciation of the value and dignity of the Ibo's traditional ways of life but his overriding theme is the need for men to have flexible receptive minds. The hero of each of these novels comes to a tragic end because he cannot adapt to the demands of a new and unforeseen situation.

The three books are characterised by the grace and dignity of their language and are very different in tone from Achebe's latest novel.

A Man of People 1966

This is a fiercely ironic study of the career of Chief Nanga, a leading demagogue in a newly independent African state. It has been suggested that the portrait of Nanga is modelled from Nkrumah. Although Achebe presents Nanga as an unscrupulous opportunist, he also stresses the attractive qualities of his character and suggests that he is ultimately a victim of circumstances. It is interesting to compare this novel with Nipaul's *Memo Men* (*qqv*).

James Baldwin (b 1924) See also Section I

Baldwin emphasises the harsh brutality of contemporary life, particularly for the American Negro. One of his dominant themes is the necessity for honesty about oneself; this includes a frank acceptance of one's sexual nature, whether heterosexual or homosexual. He suggests the brutality of modern life is due to the fact that many people, especially though not only, White people, are afraid of themselves and therefore incapable of accepting or loving others but fear them and sadistically exploit and attack them. He shows the tragic effects of such viciousness upon those who suffer it and also upon its perpetrators. Much of the distinction of Baldwin's work comes from the compassionate understanding with which he treats the latter. He acknowledges the discovery and acceptance of oneself may involve great suffering and always requires courage and suggests it is only possible if one is willing to love others and accept the support of their love.

Go Tell It on the Mountain 1954 Co

The novel covers two days in the lives of a Negro family who belong to a strict fundamentalist sect, The Fire Baptised. The members of this fellowship identify themselves with the Israelites in captivity. Baldwin shows how this is a reaction to the harshness of their lives and compassionately reveals the mixture of genuine and deluded religious experience among the sect's

members The language of the novel is permeated by echoes of the Authorised Version of the Bible

Giulian's Room 1956 Co

This is a tragic story of a young American who fears his homosexual predilections and hideously ruins the lives of his Italian lover and of his own family

Another Country 1962 Co

The novel is centred on the lives of a mixed racial group of Greenwich Village artists and intellectuals The brutality of New York life is reflected in the crude and obscene language the characters use so casually At the end of the novel five of the central figures are as the title suggests on the verge of a new though not necessarily easy life after their difficult and often bitter quest for love and self knowledge

Tell Me How Long the Train's Been Gone 1963 Co

A star Negro actor looks back on a life dominated by fear and conclude that for the majority of Black Americans violence offers the only road to freedom This is a disappointing novel when compared with Baldwin's earlier ones for it is less objective and therefore less powerful than they It is nevertheless an important expression of the growing bitterness of Black Americans and constitutes a vehement denunciation of the behaviour of the White community

In each of these novels Baldwin uses a mixture of straightforward narrative and flash back techniques.

Samuel Beckett (b 1906) See also Section I

Beckett was awarded a Nobel prize in 1969 The form of his novels has been influenced by the work of his friend Joyce and also and more particularly by his study of Proust. An erudite man Beckett delights to enrich his work with subtle allusions to the writings of other authors and those to whom he most often refers include St Augustine and Dante. Belacqua the hero of his first stories who is often mentioned in the later novels is a character from the fourth canto of Dante's *Il Purgatorio* (P)

Since Beckett's work becomes progressively more difficult and his later novels contain many references to his earlier ones readers are advised to begin with the short stories *More Pricks Than Kicks* 1934 and *Murphy* 1938 (C). Beckett now writes in French recreating his works in English He is said to prefer French because that language is the more precise This search for precision relates to one of the central themes of his novels the agonising inadequacy of words to express the truth of the human condition and links Beckett's work with that of other major twentieth-century writers like Kafka and Italo Calvino and the philosopher Wittgenstein All Beckett's heroes are driven to feel that they can only tell lies and they long to achieve the silence of truth but since truth always eludes them they continue to tell their stories—One must go on—in the vain hope that they may at last speak the truth and so be released from the tyranny of words

Beckett is a supreme exponent of the themes of isolation and bewilderment imprisonment and suffering that are to be found in the work of so many contemporary writers and of artists like Francis Bacon Poetic in structure and use of language his latest novels haunt the reader's imagination Each is the monologue of a crippled old man imprisoned in a terrifying incomprehensible world where life seems a grotesque bitter farce directed by an elusive tyrant Yet harrowing as they are these novels have their positive side and their bizarre humour has led one critic to call them supremely entertaining Beckett's heroes have the tragic gaiety of clowns and, although as prisoners are said to they fear

to achieve their longed for freedom they never abandon their quest for it

Wall 1953 C

This transitional work is the last novel Beckett wrote in English and was composed between 1942-4 when he was in hiding as a member of the French Resistance

Sam a patient in a mental hospital tells the story of his fellow inmate Watt who has been a servant to the mysterious Mr Knott Watt's purpose in going to Knott's house is expressed in terms of a religious quest but while he was there he discovered the impossibility of possessing any certain knowledge The novel is comic in tone and its style recalls Sterne's *Tristram Shandy*

The Trilogy—Molloy Eng pub 1955 *Mallone Dies* Eng pub 1966 (P) *The Unnamable* Eng pub 1968

In the first part of *Molloy* the bedridden speaker recounts his compulsive futile quest for his mother in the second the tyrant Youdi sends a messenger Gaber to one Moran ordering him to go and look for Molloy Youdi's name derived from the Arabic Yahudi (of Yahweh) is a French colloquialism for Jew Gaber suggests Gabriel Moran doubts Youdi's existence but fears to disobey the order He fails to discover Molloy Molloy and Moran probably represent aspects of the same personality

In *Mallone Dies* the bedridden Molloy Moran Mallone awaits death telling stories about other personifications of himself

The harrowing *The Unnamable* continues the hero's fruitless search for some understanding of his own identity

How It Is 1964

Arranged in short passages of unpunctuated prose poetry this extraordinary work has the effect of nightmare delirium The speaker who is at first anonymous it seems in the throes of a mortal illness and imagines himself naked, dumb crawling through mud with a sack of flamed fish suspended from his neck until he meets another Pim in a similar condition He tortures Pim until the latter speaks By now the narrator has a name Bom Pim deserts Bom who posing the idea of life as a circle or procession of torturers and victims awaits his own torturer

Professor Kermode in *Continuities* has noted the ritual quality of this novel's language and drawn attention to the parallels between Beckett's images and those of medieval allegory suggesting that Bom's sack may be taken as a symbol of the soul the burden and support of the body and that Pim may be interpreted as an image of Christ the tortured Word Incarnate

Saul Bellow (b 1915)

Bellow is a leading American novelist and short story writer Like Beckett's his characters engage in purgatorial quests but whereas Beckett's seek answers to the questions 'Who am I? What is truth?' Bellow asks rather 'What makes a good life?' For the heroes of Beckett's tragic fables death is both sought as a release from their quest and feared lest the apparent release it offers prove an illusion For Bellow it is death which above all else gives meaning to life and only when his heroes face the physical reality of death which they fear do they begin to accept that death of the self which will enable them to combine individual freedom with social responsibility Thus while Beckett's characters become increasingly isolated in a sterile world Bellow's move towards escaping from self absorption into an awareness that the significance of life is to be found in the ranks with other people and in selfless

love for them. Only in *The Victim* and *Mr Sammler's Planet* however does Bellow show any of his heroes attempting to put this into practice and this last novel is the only one with a wholly convincing conclusion.

Bellow's ethical and social concern, a product of his heritage as the son of Russian Jewish émigrés, links him with the great nineteenth-century European novelists. He feels that although earlier writers answered to the question of what makes a good life may be inadequate for us who live in an urban, technological society, the question nevertheless remains and he considers that most modern novelists evade it, retreating into ivory towers and concentrating upon the production of formally perfect works of art.

Despite his emphasis upon the importance of a novel's content, Bellow has always striven to improve the style and form of his work. This led him to abandon the Flaubertian standard he had adopted for his first two novels when he discovered it was an inadequate vehicle for his own—very different—experience. The form of the transitional *Augie March* is shapeless and Bellow's style in this book and in *Henderson the Rain King* is sometimes undisciplined, but his later novels are very carefully and skilfully constructed and at its best his writing is vigorously exuberant and often wildly funny.

Bellow is keenly aware of the ugliness and suffering of life which he vividly portrays in his novels, yet the overall effect of his work is one of hopeful optimism, in contrast to the anguish and wryly stoical endurance of Beckett.

The Victim 1947 P

This Bellow's second novel (his first *Dangling Man* appeared in 1944) has a New York setting of purgatorial heat and squalor. Its Jewish hero, Levantthal, a moderately prosperous journalist, has known hard times and fears their return. Alone for a few days while his wife visits her mother, he feels particularly vulnerable. His worst fears become embodied in the person of the Gentle Albee, a former vague acquaintance who appears declaring that his present misfortunes are the loss of his job and wife, are Levantthal's fault. Only when he is able to admit some responsibility for Albee and saves him from death, is Levantthal freed from fear.

This concentrated novel still seems one of Bellow's finest.

The Adventures of Augie March 1958 P

Originally entitled *Among the Machiavellians*, this is a picaresque chronicle of the fortunes of an illegitimate slum boy as he seeks a way of life which will enable him to combine responsibility towards others with freedom from the Machiavellian reality instructors who seek to dominate him and to convince him that life is a rat race.

Although this prize-winning novel was highly praised on publication its rambling shapelessness now makes it seem Bellow's least successful.

Seize the Day 1956 P

This novella was first published together with three short stories, *A Father to Be Looking for Mr Green* and *The Gonzaga Manuscripts*. Like them it is concerned with the insidious power of money. Broke and out of work, Wilhelm feels he is being strangled by the encircling pressures exerted especially by his separated wife, his swindling friend and his scornful father. On the day of which Bellow writes Wilhelm's troubles come to a head, but through them he struggles to regain the sense of "general love for other people, which is, he becomes convinced, "the right clue to the resolution of his difficulties.

Henderson the Rain King 1959 P

The prodigal Henderson dissipates his massive strength and fortune creating havoc and misery as he seeks to quell his soul's demand for a meaningful life. Eventually he flees to Africa where he inadvertently becomes the Rain Maker of a primitive tribe and thus heir presumptive to its king. When the latter's death is contrived by his jealous subjects, Henderson, who has already realised that it is his duty to return to his wife, escapes from the tribesmen and begins his journey home, a fighting Lazarus.

Whereas Henderson escaped to Africa, Herzog, a lecturer in philosophy, retires to bed in the derelict country house to which he has fled, shattered by his wife's desertion and his own inability to hate her new husband whom he had planned to shoot! Incidents in his past life are interspersed with extracts from the letters Herzog endlessly composes on personal, social and philosophical questions as he seeks to explain to justify to put in perspective to make amends. Gradually he realises that he has stopped hating his former enemies and that to continue his solitary brooding would be self-indulgent, so like Henderson, he prepares to return to our common life to share with other human beings as far as possible.

This hilarious novel is constructed with great skill and ingenuity.

Mr Sammler's Planet 1969

Born into a wealthy Polish family, educated at Oxford, demised of Bloomsbury and later of a concentration camp from which he miraculously escaped, the 72-year-old Sammler is an interested observer of modern American life where people seem to him to be frantically seeking to ignore the fact of death and absorbed in illusory attempts at self-fulfilment rather than in caring for one another. The death of a nephew makes Sammler realise that he too has begun to evade his responsibility towards others.

Elizabeth Bowen (b 1899)

A stylistic artist in the tradition of James Joyce, Bowen is famed for the beauty of her descriptive writing and for her sensitive analyses of feeling. Her finest novels are *To the North* 1932, *The House in Paris* 1935, *The Death of the Heart* 1938 (P).

Of her later novels the best seems *The Heat of the Day* 1949 (P), a love story set in war-time London, but her most recent, *Eva Trout* 1969, was awarded the James Tait Black Memorial prize for the best novel of 1969.

Christine Brooke Rose (b 1916)

The writing of Christine Brooke Rose, a lecturer at the free university of Valenciennes, is associated with that of the French authors of the *nouveau roman* and she has translated the work of Robbe-Grillet, one of their leaders.

Herself the author of eight novels, she now disowns the first five which are traditional in style and form, acknowledging only her recent experimental work, the novels *Out* 1984 (now out of print), *Such Between* and the short stories *Go When You See the Green Man Walking* 1970.

She has a poetic gift for creating precise visual images and a comedian's joy in the ambiguity of words which she delights to place in novel and unexpected juxtapositions using a form of the stream of consciousness technique.

Such 1968

This bizarre work may have been inspired by Nathalie Sarraute's *Between Life and Death* 1965.

The key to its significance seems to lie in the sentence: 'Surely man as such puts tremendous effort into moving through space and time.' The struggling central consciousness of the book belongs to Laurence/Larry/Lazarus who at first hovers between life and death later between consciousness and unconsciousness then between a continued withdrawal from everyday life and returning to it. An underlying theme is man's effort to distinguish between reality and illusion honesty and self-deception truth and falsity.

The novel's imagery is drawn from the world of astrophysics in which Laurence worked and also owes something to popular science fiction.

Between 1969

The lyrical and often very amusing *Between* expresses a sense of suspended animation and loss of identity in a world devoid of significance as experienced by a woman interpreter. Of mixed nationality neither married nor unmarried neither young nor old she moves from one meaningless international conference to another in indistinguishable planes stays at indistinguishable hotels meets indistinguishable people speaking a confused Babel of languages as she does herself.

The weakness of *Between* is that it expresses rather than explores a state of mind and such expression can be more powerfully and economically conveyed in verse than prose.

Alan Burns (b c 1935)

Burns is regarded by some critics as among the avant-garde of contemporary English novelists and his work has been highly praised by Angus Wilson a writer in a much more traditional vein. However Burns's vision of the brutality, hypocrisy and futile materialism of modern life seems to find successful expression only in the early *nouvelle* *Buster* and in *Celebrations*. Both draw upon his traumatic adolescent experience of the deaths of his mother and brother.

Burns's first book was conceived as a series of snapshots after he had noticed a photograph in a Chancery Lane window. He now writes in two stages cutting up his draft manuscripts into hundreds of slips of paper and shuffling them so as to achieve new random associations between their words and images. This cut-up technique if technique it can be called seems to have been devised by the popular American novelist William Burroughs.

Buster 1961 C

Published in Calder's *New Writers I* and later filmed this short impressionistic tale is more easily followed than Burns's later novels and throws helpful light upon *Celebrations* (q.v.).

Its protagonist Buster early wins the approval of his conventional father who designates him as a future Lord Chief Justice while rejecting his older son who has repudiated his values. Buster however admires his brother. Later he too rebels against their father and deliberately fails his law exams. When, in consequence, he is also rejected he bursts into the family home and unexpectedly fulfilling his father's prediction wreaks justice upon Helen the older man's beautiful spiteful mistress.

Europe After the Rain 1965 C

This novel was inspired by Max Ernst's painting *Europe After the Rain* depicting a devastated urban landscape. Inconsequential and dream-like the action opens with its narrator, accompanied by a girl, crossing a river into a devastated region which is under martial law. The girl is searching for her father whom from time to time, she finds. Her quest merges with the narrator's intermittently successful search for her. The novel ends with his return across the river alone but satisfied.

Celebrations 1967 C

Here as in *Buster* the novel centres upon the antagonistic relationships between two brothers and their brutal father and his mistress.

The novel's setting moves erratically between the Arctic and a typical suburban industrial estate. The timing of its action fluctuates in a similarly irregular way between the early part of this century and the present.

Williams the father is the head of a factory/state. His sons work there and when the younger wishes to leave Williams contrives his death. The older son plays a waiting game eventually wins the hand of his father's mistress and usurps his position.

The parts of this surrealist novel evoking life in the factory have a nightmare quality. The intervening parodies of state funerals and weddings are biting satire.

Babel 1969

Unlike Burns's previous novels this lacks even a skeletal narrative. Most of the book is written in short passages of rhythmic prose but the rhythms are monotonous and numb one's response to the sense of the words. Each passage opens with a headline quotation. Sometimes this headline stands alone but usually it is followed by a brief meditation or comment. References are made to over two hundred people alive and dead including many prominent in various walks of public life. The overall result is confusion and bewilderment admittedly an appropriate image of Babel but aesthetically and imaginatively unrewarding. One feels that Burns might have expressed this disenchanted vision more successfully had he submitted it to the discipline of verse.

Ivy Compton Burnett (1864-1969)

Miss Compton Burnett was a highly conscious artist who knew her limits and never exceeded them. Apart from an early rejected work she published eighteen novels: the first *Pastors and Masters* in 1925 the last *The Mighty and Their Fall* in 1963. Her nineteenth novel *The Last and the First* was published posthumously in 1971. Written mainly in dialogue each of her books deals with the claustrophobic life of a well-to-do middle class household at the turn of the century. Miss Compton Burnett's themes are those of Greek tragedy her formal decorous language is reminiscent of Jane Austen. The combination can be disconcerting.

Lawrence Durrell (b 1912)

Durrell's shorter novels are *The Black Book*, *While Eagles Over Serbia* and *The Dark Lady* (q.v.). His longer baroque fantasies have had a mixed reception. Their most appreciative critic is G. S. Fraser.

The Alexandria Quartet—*Justine* 1956 *Balthazar* 1958 *Mosbeline* 1958 *Clea* 1960 (all F).

Some find the Quartet a most enjoyable novel for others it is all but unreadable.

Its form says Durrell is based on the relatively proposition the first three volumes which give differing aspects and views of the characters lives and motives, having a spatial relationship the fourth which continues the narrative more or less chronologically representing time. The novel's construction thus resembles that of Faulkner's *The Sound and the Fury*, and has much in common too with works like Cary's *Gulliver Jimson Trilogy*.

Durrell's apparent theme is erotic love but his underlying interest is the relationship between art and life. He suggests life is significant only when interpreted by art. This attitude, rather than the form of his work, differentiates it from novels like Faulkner's and Cary's.

Durrell's volumes contain splendid passages but too often in the novel as a whole his sensuous language seems merely florid and pretentious his characters but flimsy inhabitants of a decadent fairyland

Time 1968 T *Nunquam* 1970

These two volumes comprise a single novel. Their titles are derived from a line from Petronius's *Satyricon*: 'Aut tunc aut nunquam'—Then or never. The theme of the work seems to be the individual's struggle for a sense of freedom in a world dominated by international commerce but although Durrell's theme is serious his treatment of it seems not only bizarre but frivolous as he chronicles the career of his protagonist Charlock, an inventor who is taken captive by the all powerful international firm of Merlin and eventually becomes its head.

Some passages in *Time* describing Athens and Constantinople recall the better parts of *The Alexandria Quartet* but in *Nunquam* there is a loss of momentum. This second volume is mainly concerned with the creation of a life like dummy representing the dead film star Iolanthé with whom Julian the impotent head of Merlin falls desperately in love and dies as he tries to prevent her from committing suicide by jumping from the gallery of St Paul's Cathedral.

Ralph Ellison (b 1914)

The Invisible Man 1952 P

Ellison is an American Negro and former musician. This his only novel is poetic in its complex symbolism and compelling language and in the intensity of its feeling.

We learn from the prologue that Ellison's hero is not only invisible but an underground man living in a cellar. He has affinities with the narrator of Dostoyevsky's *Notes from the Underground*. The novel also recalls Kafka. Like Kafka's Ellison's hero is anonymous and his vividly recounted experiences have the quality of bewildering dreams at times of nightmare. He tells of his life from the night he received a scholarship to the State Negro College to the night of a terrifying Harlem race riot when fleeing from supporters of a deranged Black nationalist Ras the Destroyer he took refuge in the cellar.

One of the novel's central episodes is that in a paint factory hospital where the hero is subjected to torturous experiments and there is talk of castrating him. Among other things the episode signifies the way in which all the scientists he encounters exploit those in their power attempting to force all life into rigid sterile patterns. Life he says is to be lived not controlled. A free society is loving and infinitely various.

The hero realises the scientists—politicians, demagogues and confidence men—are unaware of the limitations of their vision and cannot see they are destroying themselves as well as their dupes and victims. Images of blindness recur through out the novel. The narrator calls himself 'invisible' because he has come to feel people who look at him see only projections of their own imaginations. He realises he has been equally blind. One of the novel's themes is his gradual enlightenment as he learns to understand himself and others better—to see reality.

William Faulkner (1897-1965)

The American Faulkner received the Nobel Prize for Literature in 1950. Although his last novel was published only three years before his death, most of his best work appeared between 1922 and 1936. *The Sound and the Fury*, *As I Lay*

Dying Light in August (all P). *Abraham Lincoln* 1940. Together with the comic *The Hamlet* 1940 these novels are his finest achievement.

Faulkner's post-war novels can be divided into three groups: (1) those which are simply enjoyable stories: *The Town* 1957, *The Mansion* 1959 which together with *The Hamlet* form the Snopes trilogy and *The Reivers* 1962 (P). (2) *The Intruder in the Dust* 1948 (P) which is too overtly didactic to be a successful novel though of great interest to anyone concerned by the racial problems of the South. (3) two ritualistic novels: *Requiem for a Nun* 1951 (P) and *A Table* 1964 the latter set in France in early 1918 is constructed on an elaborate series of parallels with the events of Holy Week.

Faulkner's work is concerned almost exclusively with the Southern States and set in the mythological Yoknapatawpha County, Mississippi. A Southerner by birth he is soaked in the history and legendary folklore of Mississippi. Although many of his most memorable characters are bizarre tragic figures subnormal poor Whites murderers or other outcasts of society his work reflects not only the gruminess the callousness and brutality of the South but also the proud individualism, courage, humour and vitality of its people. Thus one reads Faulkner with pleasure despite the difficulties presented by his style.

These difficulties are at times inherent in his subject as at the beginning of *The Sound and the Fury* which is told from the viewpoint of a moron in the touching episode in *The Hamlet* when the idiot Ike Snopes steals a cow he loves in the evocation of Charles Mallison's nightmare (*Intruder in the Dust*). Sometimes however Faulkner seems needlessly obscure he indulges in turgid rhetoric his sentences are often three or four pages long sparsely punctuated and containing innumerable parentheses and parentheses within parentheses. The effect of such clumsy syntax is utterly bewildering and one sympathises with the exasperated critic who declared Faulkner a genius without talent. Such criticism however ignores the comic aspect of Faulkner's work his gift for raucous demotic humour.

William Golding (b 1911)

Golding's novels are poetic and like all poems cannot be fully appreciated on first reading. Essentially a religious novelist he aims to write total myths illuminating contemporary life. To a remarkable extent he has succeeded.

Golding has enormous technical virtuosity: no two of his works are alike although they express the same vision—a vision of men without God as tragic figures who seem unable to move without killing each other, torture those they love, watch themselves becoming automata. But Golding suggests man can regain freedom and the state of grace in which everything that lives is holy. Thus all his novels except *Panther Martin* express not only the horror but also the wonder and beauty of life.

Lord of the Flies 1954 F P

Golding rewrites *Coral Island* in realistic terms as an allegory of the Fall and an image of twentieth century society that makes and drops atomic bombs.

The Inheritors 1955 F

This astonishing *tour de force* shows the advent of *Homo sapiens* mainly through the eyes of the Neanderthal Lok. The measure of Golding's skill is not simply his brilliant evocation of the largely non-verbal world of Neanderthal Man but his avoidance of sentimentality. He shows the inevitability of *Homo sapiens* supremacy and the tragedy in which it involves him, as well as Lok.

Puncher Martin 1956 F P

This novel chronicles the struggles of a drowned sailor against God's overwhelming love. Made like all men in God's image Martin is named Christopher. Alive he chose to punch every thing he could, dead he refuses abnegation of himself and therefore continues to exist in a self made Hell on a rock he creates from the memory of a decaying tooth. Martin's struggles for survival are heroic ghastly futile.

Free Fall 1950 F P

Sammy Mountjoy retraces his life to discover when he lost his innocent delight in life and its beauty and how he regained this. Containing fine passages the novel is marred by the fact that Sammy interprets the significance of events in stead of the interpretation being left to us.

The Spire 1964 F

The narrative of this Golding's masterpiece centres on the building of the spire of Barchester (Salisbury) Cathedral. The cathedral symbolises three aspects of life: man suffering, crucified man, praying, erotic man.

Jocelyn the Dean believing himself divinely appointed to build the spire presses for its completion with ruthless disregard of the suffering and death he causes. His motives are in fact mixed and largely unconscious. Gradually he recognises his hubris and the mixed motives behind his obsession, realising his wicked folly. Admitting on his deathbed he knows nothing about God, Jocelyn is granted a vision of His glory and the wonder of creation as he gazes at the transfigured spire.

The Pyramid 1967 F

Set in Stillbourne, a small Wiltshire town, the novel is superficially a tragic comedy of provincial life (its central episode is very funny) but on a deeper level *The Pyramid* is a searching exposure of materialism.

The novel's central images are musical ones. Various tastes in and ways of performing music signify various kinds of love and modes of life. The title suggests the social pyramid on which the townsfolk wish to rise and also a metronome to whose rhythm that of a selfish class ridden society they choose to move like robots.

Nadine Gordimer (b 1923)

The writing of Nadine Gordimer, a South African, is banned in her own country. She has published four volumes of stories and five novels. The last of the novels *A Guest of Honour* appeared in 1971. Nadine Gordimer is more successful as a short story writer than as a novelist for she seems to lack the power to develop character at any length. One is nevertheless compelled to admire her brave and outspoken criticism of the calousness of the South African régime which makes the people of that country inhabitants of a 'World of Strangers'. The latter is the title and theme of her second novel.

Graham Greene (b 1904)

Greene's best work is *The Power and the Glory* 1940 (P). Apart from the works he calls 'enter tainments' of which the latest is *Travels with My Aunt* 1969, Greene has published five novels since the War. They are *The Heart of the Matter* 1948, *The End of the Affair* 1951, *The Quiet American* 1955 (all P), *A Burnt-out Case* 1961, *The Comedians* 1966 (P). All have settings of topical interest: war time London, the Congo, Vietnam, Haiti.

While Greene's work has been influenced by the thriller and the film, his literary master is Conrad and, although Greene's novels often seem

rather superficial and at times he appears unable to treat his characters objectively, he nevertheless tells a good story and is skilled at evoking the discomfort and squalor of life in the tropics. In his first two post war novels he failed to achieve artistic resolution between his religious beliefs and his feeling that life is a sordid struggle against impossible odds but *The Quiet American* and *The Comedians* which have no overtly religious themes are more successful.

L. P. Hartley (b 1895)

Hartley is a professional novelist and craftsman in the tradition of James and Hawthorne; the latter his acknowledged master. Like Hawthorne's Hartley's themes are moral, illuminated by skilful use of symbolism. In his best novels his style is humorous and gently ironical but in others he lapses into sentimental melodrama.

Hartley seems at his happiest when writing of children and adolescents, a recurrent figure in his work is the delicate overprotected hypersensitive and introspective boy as in *Eustace and Hilda* 1947, *The Go Between* 1953, *The Brick field* 1964. (The heroes of *The Boat* 1950 (C), *The Betrayal* 1966 and *My Sisters Keeper* 1970 are older, less successful versions of the same figure.) Hartley is skilled in evoking the atmosphere and scene of his characters' environment particularly when the latter is East Anglia in the earlier years of the century: Oxford or Venice.

Of the fourteen novels he has published the latest is *My Sisters Keeper* 1970. The best are:

The Eustace and Hilda trilogy—*The Shrimp and the Anemone*, *The Sixth Heaven*, *Eustace and Hilda* F.

The novel's theme is symbolised in the opening chapter when Eustace and Hilda, playing on the beach at Anchorstone (Hunstanton) try to rescue a half eaten shrimp from an anemone. The former is an image of the self sacrificing Eustace, the latter of his beautiful possessive sister. The effort to qualify for Hilda's approval is the ruling force in Eustace's life.

Hartley presents his hero with sympathy and humour. The novel follows Eustace to Oxford and Venice and ends with his return to Anchorstone to the now paralysed Hilda. Counter pointing their mutually destructive relationship is the vital life of their sister Barbara and her husband.

The Go Between P

The innocent Leo, staying with the rich family of a school friend, acts as a messenger between the latter's sister and her farmer lover who like the rest of the characters appear to him god like figures.

A Perfect Woman 1955

Save for their children Isabel and Harold have little in common. She finds him dull but an ardent reader of novels, believes herself aware of the dangers of indulging in romantic daydreams. Her boredom and dissatisfaction become clear when the handsome novelist Alec enters their lives after a chance meeting with Harold. Both wish for Alec's approval and friendship and to gether scheme to procure for him the barmaid of the local pub.

The voice of Isabel's conscience symbolised in her son's shouts to his sister 'Janice go back!' constantly interrupts her daydreams of Alec and the children's game with the doll Pamela gives symbolic warning of the dangers of their parents' wicked scheme.

The full irony of Hartley's title becomes clear at the end of the novel, when the publication of

Alec's new book provides another comment on his relationship with Isabel and Harold

Others of Hartley's novels *The Boat My Fellow Devils* 1961 *The Brickfield* and *The Betrayal* have very similar themes to that of *A Perfect Woman* but only in the treatment of Margaret the heroine of *My Fellow Devils* does he approach the objective sympathy which characterises his presentation of Isabel and Harold and in none of these other novels does he make such subtle use of poetic imagery as he does in *A Perfect Woman* *Dustace and Hilda* and *The Go Between*

Ernest Hemingway (1898-1961)

This controversial American was awarded the Nobel Prize for Literature in 1954. Hemingway's language and syntax are of extreme at times monotonous simplicity. He writes best of physical activities like hunting and fishing. The theme of all his writing is personal honour and courage but he tends to romanticise violence and suffering. His finest work is his earliest, the short stories *In Our Time* 1924 and the novel *A Farewell to Arms* 1929 (P). Hemingway's last novel, *The Old Man and the Sea* 1952, the story of an old man's struggle to catch and land an enormous fish, has immediate appeal but on subsequent readings its language seems contrived and precious.

Originally entitled *The Sea in Being* *The Old Man and the Sea* was planned as one of four volumes set in the Caribbean. Hemingway intended eventually to weld them into a single novel. Two of the other books he called *The Sea When Young* and *The Sea When Absent*. The other unnamed one he considered complete and intended to publish it in 1961 but this plan fell through. Now given the posthumous titles *Burns*, *Cuba* and *At Sea* these volumes which have been subjected to the editorial cutting of Mrs Hemingway and O. J. Schriener Jr. have been collected and published as *The Islands in the Stream* 1970.

Dan Jacobson (b 1929)

Jacobson by birth a South African now lives in England. He has published six novels all in a traditional form.

The Trap 1955 *A Dance in the Sun* 1956 *The Price of Diamonds* 1957 (all P)

These are three beautifully precise vignettes of South African life. *The Trap* and *A Dance in the Sun* present the tragic spiritual corruption engendered in those who support apartheid. *The Price of Diamonds* is a deliciously comic study of two business partners in a small mining town.

The Evidence of Love 1959

Jacobson's first full length novel. *The Evidence of Love* lacks the verve and precision of his earlier work. It tells how two protégés of a wealthy South African spinster fall in love and of the difficulties they face due to the fact that one of them is Coloured the other White. Those parts of the novel which deal with the life of the Coloured Kenneth are often vivid but Jacobson's presentation of the heroine Isabel, is rather lifeless.

The Beginners 1966 P

Jacobson's novels with a South African setting culminated with this chronicle of the life of a family of South African Jews, evoked through a series of brief snapshots. The career of the novel's central character Joel, bears some resemblance to Jacobson's own.

The Rape of Tamar 1970

A note of cynical despair, a sense that life is futilely repetitive but faintly discernible in *The*

Evidence of Love and *The Beginners* here becomes predominant. The story of *The Rape of Tamar* derives from *2 Samuel 13* but Jacobson's interest lies not in the creation of an historical verisimilitude but in the presentation of his narrator the cynical speculative Yonadab a ghost conversant with twentieth century culture who like the novelist feels compelled to recreate his past experience in order to objectify it.

B S Johnson (b 1933)

Johnson's *The Unfortunates* makes very painful reading but he is otherwise one of the most entertaining as well as one of the most skilful of contemporary *avant garde* writers. The predominant influences upon his work are the novels of Lawrence Sterne and Samuel Beckett.

Johnson prefaces his second novel *Albert Angelo* with a quotation from Beckett's *The Unnamable*. When I think of the time I've wasted on these bran dips when I had me on the premises and towards the end of *Albert Angelo* he says 'I'm trying to say something about me through him about when what the point telling stories is telling lies I want to tell the truth about my experience to reproduce the moment to moment fragmentariness of my life and to echo it in technique'. Unlike Beckett Johnson seems to feel it is possible to tell the truth.

His expressed aims as a novelist are those of the French Nathalie Sarraute but from the time of *Albert Angelo* Johnson would seem to have moved much further than she has towards abandoning the pretence of writing anything but the most thinly disguised autobiography. It is not simply that he says he writes about himself and includes in each of his last three novels such common details as references to a childhood in Hammersmith but that his writing particularly in the High Wycombe scenes of *Trawl* and in almost the whole of *The Unfortunates* conveys the feeling of vividly remembered personal experience rather than of fiction created upon the basis of such experience.

The difference between such apparently autobiographical novels and Mailer's avowedly documentary *Armies of the Night* (qv) is primarily formal and stylistic but also derives from the fact that whereas Johnson writes about private life Mailer reports himself as a participant in affairs of national and international importance.

Travelling People 1963 Pa

In this prize winning farcical comedy Henry a young hitch hiker is given a lift by Trevor a businessman who offers him a summer job in the luxury Stromboli Club on the Welsh coast which Trevor and a friend run as a hobby.

The novel whose form has been much influenced by Sterne's *Tristram Shandy* is written in a variety of styles.

Albert Angelo 1964 Pa

Here Johnson's protagonist is *alter ego* Albert is an aspiring architect who earns his living as a supply teacher in the Angel area of Islington. Often hilariously funny the novel is distinguished by the loving precision with which Johnson captures the atmosphere of London's dilapidated inner suburbs and the skill with which he deploys his fragmentary collage technique.

Trawl 1966

An unnamed narrator describes his experience as a winter pleasure tripper on a North Sea trawler. As the sailors fish the writer throws a trawl net into the sea of his memories. By the end of the three week voyage he has overcome his chronic sea-sickness (literal and metaphorical) and looks forward to reunion with his girl friend, Ginny, the Virginia of *Albert Angelo*.

CONTEMPORARY NOVEL

The Unfortunates 1969

The first and last sections of this book are fixed the rest bound in loose leaf so that readers may shuffle them—which seems a gimmick of small value but enables those so inclined to rearrange the book into two chronological narratives

Johnson tells of a Saturday in the life of B S Johnson (now married to Ginnie) who goes to a Midland town—clearly recognisable as Notting ham—to report a football match When a student Johnson visited the town and university as the guest of two friends Tony and June to whom he says he dedicated his first novel (as indeed the author did) On this later visit he is preoccupied by memories of these friends and of Tony's premature agonising death

Doris Lessing (b 1919)

A Rhodesian by birth Doris Lessing emigrated to England in 1949 She is probably best known as a novelist but has also published poems short stories and plays

Her novels explore ways in which people are affected by belonging to minority groups Her subjects include white Rhodesians and South Africans members of extreme left-wing political parties and women who resent the fact that ours is still largely a man's world. The objective sympathy which is so distinguishing a feature of her treatment of the first two subjects occasionally deserts her when she writes about the third.

The Grass is Singing 1950 P

In this accomplished first novel set in South Africa Doris Lessing writes of the tortured lives of Dick and Mary Turner isolated members of the White agricultural community and of their relationships with their African servants

The Children of Violence—Martha Quest 1952 *A Proper Marriage* 1954 *A Ripple from the Storm* 1958 *Landlocked* 1965 (all Pa) *The Four-Gated City* 1969

Reading the first two books of this sequence one is constantly reminded of George Eliot Not only do both novelists employ similar techniques but they share an intense concern with problems of morality and ethics Martha Quest the novel's passionately idealistic heroine recalls Dorothea Brooke and Maggie Tulliver and is presented here with the same kind of objective ironic sympathy that characterises George Eliot's treatment of Dorothea

In the third and fourth books however the portrayal of Martha is almost overwhelmed in a detailed study of the social and political life of Rhodesia during the Second World War Fascinating as social documents from a literary view point these volumes at first seemed less satisfying than the earlier ones but their function within the whole novel became clear upon the publication of *The Four-Gated City*

In this volume which is set in England the political and social questions of the last twenty years play a prominent part but Mrs. Lessing now emphasises their effect upon the individual as she depicts the mature Martha's gradual realisation of the ways in which a person's life and personality can be distorted by unquestioning acceptance of an ideology and how this can lead him to damage others as well as himself by denying the importance of individuals and dismissing their intuitive and imaginative insights.

This final volume has an appendix whose action is set in the future after a series of catastrophes have devastated much of the world This section reads convincingly but follows rather awkwardly upon the naturalism of the rest of the novel

M15

LITERARY COMPANION

The Golden Notebook 1962 P

The content of this novel is most interesting but its form is awkward The first part of each of its sections recounts incidents in the lives of the heroine Anna and her friends and acquaintances The rest of the novel consists of extracts from notebooks some diaries some stories in which Anna a novelist writes of her feelings about her work and her experiences as a disillusioned member of the Communist Party and as a divorcee who hopes to remarry

Malcolm Lowry (1909–57)

Under the Volcano 1947 P

Readers of this complex novel one of the century's finest should see Lowry's own criticism of it in *Selected Letters* edited Breit & Lowry (Cape)

Set in Mexico in 1938 and 39 it relates the tragedy of the alcoholic Geoffrey Firmin and his wife Yvonne to the world tragedies of war and man's inhumanity to man

In his neglected garden—a symbol both of his ruined marriage and of the mutilated world—Firmin stumbles on a broken notice board On it are the words

Do you like this garden?
Why is it yours?
We evict those who destroy!

words repeated at the end of the novel They recall two of its central images Eden signifying the beauty man discovers in Nature and the beauty he creates in loving human relationships Hell signifying the agony he suffers and causes others when he rejects love Lowry sees man as a splendid noble creature who must struggle incessantly to control sado-masochistic impulses which he can restrain only when he loves others and is able to accept their love Man cannot live without love is the novel's main theme

Firmin is a tragic hero in the tradition of Marlowe's Faustus to whom the novel's imagery relates him The objectivity of Lowry's portrayal of the tortured world of addiction is remarkable Firmin always has our sympathy rarely approval

This book is not simply a good story but a great poem, its themes expressed not only through the events of the narrative the lives and feelings of the characters but through vivid descriptions of Mexico and its people through subtle complex imagery

Lowry intended *Under the Volcano* to form one volume of a sequence The stories in *Hear Us O Lord From Heaven Thy Dwelling Place* 1962 (P) and the unfinished novel *Lunar Caustic* 1963 and *Dark as the Grave Wherein My Friend is Laid* 1969 were to have been incorporated in the other volumes

Mary McCarthy (b 1912)

The American journalist and critic Mary McCarthy has published five satirical novels on the lives of American artists and intellectuals *The Company She Keeps* 1942 (P) *The Osses* 1949 (S) *The Groves of Academe*, 1952 (S) *A Charmed Life* 1955 (P) *The Group* 1962 (P) Like Simone de Beauvoir and Doris Lessing Miss McCarthy is particularly interested in the rôle of the educated woman in twentieth-century society Parts of her novels are very amusing, but in general they seem too cerebral and anaemic

Norman Mailer (b 1923)

Mailer an American is a journalist and film-director and the author of one book of verse as well as six novels He sees life as a battlefield

between the forces of good and evil and the motive behind the sensationalism of much of his later work seems to be a desire to shock readers into an awareness of the nature of American society which he feels is obscene and life denying. Mailer suggests that the majority of Americans are either becoming cogs in the machines of a brutal totalitarian technology land or taking selfish refuge in drugs and nihilism instead of accepting the dangers of living adventurously and trying to establish creative relationships. Readers interested in Mailer's social philosophy should refer to *Advertisements for Myself* 1959, *The Presidential Papers* 1963, *Cannibals and Christians* 1966, *Ulam and the Siege of Chicago* 1968.

The Naked and the Dead 1948 Pa

Many critics feel this novel constitutes Mailer's most successful expression of his view of the human condition. He regards it as the work of a young engineer. Its subject is the American troops' capture of a Pacific island from the Japanese but its interest lies in Mailer's treatment of the power structure within the American force which is presented as a microcosm of society. The mass of the troops represented by the soldiers of one platoon are shown as the all but helpless victims of the men of power—the fascist General Cummings and the Platoon Sergeant Croft. Between the two groups stands the ineffectual liberal Lieutenant Hearn.

Mailer paints a remorseless picture of the agony of the ordinary soldier's life and of the absurdity of the war and is very successful in his treatment of the characters of Cummings and Croft. The weakness of the book lies in his characterisation of the lower ranks. These soldiers are obviously intended to represent a cross section of American society but although using techniques derived from Dos Passos Mailer gives a biographical sketch of each man in the platoon none of them is clearly differentiated from the others.

Barbary Shore 1951

In this turgid allegory of the Cold War the amnesiac Lovett finds himself involved in a contest between two secret agents McLeod and Hollingsworth for the affections of McLeod's wife the promiscuous Gummever.

The Deer Park 1955 Co

Mailer planned this novel as the first of eight whose themes were to cover the whole of American life. This was the only one to be finished. Its theme is pleasure and its title comes from D'Angerville's *Vie privée de Louis XV* which refers to the Deer Park that gorge of innocence and virtue in which were engulfed so many victims. Mailer's *Deer Park* is a Desert D'Or or a fictional pleasure resort near Hollywood.

An American Dream 1965 M.

Both the title and the wild improbability of this novel's action suggest that Mailer intends it to be read as an allegory showing the narrator Rojack resisting the suicidal lure of nihilism presented by the moon and then escaping from the evil forces of American society personified in his wife, her father and her maid. The sexual relationships between the characters would thus have symbolic importance.

The novel has its comic moments but its style is generally sensational and its language often highly obscene.

Why Are We in Vietnam? 1967 Pa.

D.J. an eighteen year-old Texan accompanying his parents at a dinner party shortly before leaving to fight in Vietnam, remembers a hunting trip he and his friend and his father took to Alaska two years before.

This satirical novel suggests with a measure of success the confused and distorted values of a society whose motto is 'Go out and kill'. The book is divided into alternating sections of breathless narrative and hysterical commentary progressing at a speed which leaves the reader feeling rather stunned but the chief impression is of the relish and gusto with which Mailer wrote the novel.

The Armies of the Night 1968 P

Apparently Mailer's finest work since *The Naked and the Dead* this is an absorbing and at times highly comic reconstruction of the events of the Peace March on the Pentagon in October 1967. It is written in two sections. In the first the protagonist is Mailer himself described objectively in the third person. In the second part we are helped to understand the motives and feelings of other marchers and the fears of the police and troops who confronted them. The book is notable for its objectivity and humour.

Bernard Malamud (b 1914)

Malamud's name is often coupled with that of his compatriot Bellow. They have a common Jewish heritage. Malamud's novels are similar in theme to those of Bellow but his writing is less exuberant. Both men show a keen appreciation of natural beauty rare in American novelists.

The Natural 1952 P

As Earl Wasserman has noted the events of this novel have a factual basis and its theme is that of the Arthurian regeneration myth. However this story of a baseball player lacks artistic unity and its hero is never fully convincing.

The Assistant 1957 P

Here Malamud found a much more fruitful subject the quiet tragedy of Morris Bober an unsuccessful Jewish grocer and of his Gentile assistant Frank Alpine. For the sake of Bober and of the latter's daughter Helen Alpine who has made many false starts in life gives up what may well be his last hope of achieving material success. The novel is written with beautiful restraint and Chekhovian irony.

A New Life 1961 FS P

Levin a reformed drunkard, obtains an English post at a small state college but eventually sacrifices his hard won chance of an academic career for the sake of the woman he has loved.

The novel is set in the early 1950s the period of McCarthyism. Malamud criticises the hysteria pervading American life at this time exemplified in the academic and social atmosphere of Cascadia College where Levin, a man of liberal principles suffers from his colleagues' fears and prejudices.

A New Life is less concentrated than *The Assistant*. It contains elements of picaresque comedy and is at times very amusing though occasionally its tone seems frivolous and inappropriate.

The Fixer 1966 P

Yakov Bok is like Levin, a victim of hysterical feelings of national insecurity. A Jewish odd job-man—a fixer—he leaves the Pale Settlement for Kiev hoping to begin a new more fruitful life but is arrested on a trumped up charge and endures three terrible years imprisonment awaiting trial.

The inspiration of the novel was the case of Mendel Beilis, a Kiev labourer arrested in 1911 and falsely charged with the ritual murder of a Christian child. Malamud says the novel is

intended to stand rather as a myth than an isolated case study. But it lacks the compelling force of myth.

Pictures of Fidelman 1969

Parts of this book were published in slightly different forms in Malamud's collections of short stories *The Magic Barrel* 1958 (P) and *Idots First* 1963 (P). It is an episodic work containing six pictures on the career of a would-be artist Arthur Fidelman who goes to Italy to study the work of Giotto but soon abandons this project in order to make further attempts to discover where his own talent as an artist lies.

This is an uneven work, but enjoyable for its humour which is derived as much from Malamud's style as from the ludicrous situations in which he places Fidelman. The best pictures are those entitled *The Last Mohican* and *Portraits of the Artist*. The latter contains an hilarious account of Fidelman as a sculptor of holes.

Ir's Murdoch (b 1919)

A philosophy don, Iris Murdoch has published thirteen novels, the latest being *A Fairly Honourable Defeat* 1970. A sympathetic study of her work has been written by A. S. Byatt.

Technically Miss Murdoch's experiments in fiction bear a superficial resemblance to T. S. Eliot's experiments in drama (see Sec I). Eliot sought by means of poetic ritual to give expression to the ultimate themes of man's search for truth and of the conflict between forces of good and evil and from the time of *The Cocktail Party* he sought to embody his rituals within the conventions of the well made play. Miss Murdoch seems to be trying to combine ritualistic actions and the conventions of undemanding popular fiction. Despite their sophisticated veneer few of her novels rise far above the level of this popular mode. All her earlier novels have moments of poetic intensity and beauty such as the description of Rainborough's feelings as he gazes at a snail in *The Flight From the Enchanter* 1956 (P) or Dora's releasing a butterfly in *The Bell* 1958 (P) and in the evocation of fog bound east London in *Time of The Angels* 1966 (P) but in her latest book the use of such poetic symbols degenerates into mannerism when she describes the heroine (Morgan) as pursuing of a pigeon in Piccadilly Underground Station.

Her first tale *Under the Net* 1955 (P) an amusing existentialist fantasy that recalls Beckett's *Murphy* remains Miss Murdoch's most satisfying novel. The recent *Bruno's Dream* 1969 which contains a splendid portrait of old age in the character of Bruno, suggested that her latest book might bring the flowering of her undoubted talents but *A Fairly Honourable Defeat* proved disappointing.

It shows how the complacent lives of the two liberal progressives Rupert and Hilda Foster are shattered by the intrusion of Hilda's younger sister Morgan, and Morgan's former lover the amoral Julian. Like Morgan le Fay this Morgan is an enchantress and together she and Julian destroy Rupert. The greater part of this novel is written in dialogue which is extremely difficult to follow at times as only one of the characters and he a minor one, has an individual voice. Perhaps, like *A Severed Head* 1961 (P) which it resembles, *A Fairly Honourable Defeat* will be adapted for the stage which would highlight the comic elements of its bizarre narrative.

Vladimir Nabokov (b 1899)

A Russian by birth, Nabokov came to England during the Revolution, subsequently lived in Germany and France and emigrated to America in 1940.

Translations of his early novels are now becoming available. Those he has written in English

include *Lolita* 1955 (Co), *Pnin* 1957, *Pale Fire* 1962 (Co), *Invitation to a Beheading* 1969. The first of these earned notoriety among the ill-informed who imagined it was pornographic. Nothing could be further from the truth.

Nabokov is a learned writer. His humour wit and above all his masterly use of language make his novels a constant source of delight.

V. S. Naipaul (b 1932)

This distinguished Caribbean novelist was born in Trinidad of Indian parents. The heroes of all his novels are men who feel an urgent need to give their lives order and significance. Thus although most of his work has a Caribbean setting its themes are of world wide interest. Naipaul began as a writer of comedy and all his novels have a comic element although his work has become increasingly sombre in tone as it has increased in complexity.

The Mystic Masseur 1957 P

In this delightful comedy of Colonial politics Naipaul shows the metamorphosis of Ganesh Ramsumair, an insignificant semi-educated Indian into G. Ram.ey Muir M.B.E. respected Colonial statesman.

The Suffrage of Elvira 1958 P

It was not until a few months before the second General Election in the Elvira constituency of Trinidad that people began to see the possibilities. Neighbours feuds practical jokes bribery black magic and marriage broking all play parts in this campaign which has an illomened beginning for Naipaul's endearing protagonist Harbans when he nearly runs over two Jehovah's Witnesses and a black dog! However after a costly and nerve wracking campaign he wins the coveted seat on the island's Legislative Council.

A House for Mr Biswas 1961 Fo P

This sad story tells of Mr Biswas's search for independence and security. Inveigled into early marriage he finds he is expected to become a submissive appendage of his mother in law's enormous household. Biswas has no intention of playing this rôle but he is not a practical man and has little formal education and no trade so that his first two attempts to establish himself independently soon fail. At last in his early forties he manages to buy a house but dies soon after wards.

Naipaul makes us feel the dreadful tensions and frustrations of family life in overcrowded conditions where there is never any privacy but despite its sad theme, the novel is often very funny for Biswas is an imaginative man who delights in colourful language and has a flair for picturesque invective. His touching pride in his children's intelligence and his growing love and respect for his wife are most sensitively portrayed.

Mr Stone and the Knights Companion 1963 FS

The elderly Mr Stone is filled with despair at the prospect of his impending retirement. Then he suddenly conceives the idea that active pensioners of his firm should visit the disabled. Organising this scheme gives him new hope and vigour and although these fade the novel ends on a note of subdued confidence.

The Mimic Men 1967 P

Singh, the narrator of this fascinating novel, is an exiled politician from a newly independent Caribbean state. Singh analyses the events of his life, which he convincingly suggests is representative of those of all Colonial politicians. Thrust suddenly into power, they are compelled to destroy the former pattern of administration.

and having no traditions to guide them nor any experience of government inevitably become mimic men

Flannery O'Connor (1925-64)

The work of this novelist and short story writer from the Southern States of America has a growing reputation in her own country although it is less well known in England and has until very recently been difficult to obtain

Flannery O'Connor published two novels *Wise Blood* 1952 and *The Violent Bear it Away* 1960. She writes in a poetic ruthlessly comic style about isolated eccentrics afflicted with religious mania who evolve their own grotesque fundamentalist creeds.

George Orwell (1903-50)

Orwell's post-war novels express feelings apparent in his earlier journalism.

Animal Farm 1945 P

The theme of this satirical fable is the futility of popular revolutions. Led by the pigs the animals of Manor Farm evict their brutal owners. However one of the pigs, Napoleon, gains absolute power, establishing a police state. The animals are worse off than before.

1984 1949 P

This grim nightmare which Orwell wished to call *1948*—his publisher dissuaded him—develops the ideas of *Animal Farm* in a vision of a totalitarian world whose rulers exploit psychological and technological discoveries to retain and consolidate power.

As a novel it is less successful than *Animal Farm*. It has not the latter's occasional humour and the presentation of its villain, O'Brien, is unconvincing. Raymond Williams's *Culture and Society* (P) sympathetically relates the novel to Orwell's paradoxical feelings about socialism.

Anthony Powell (b 1905)

Powell published five novels in the 1930s. The elegance of his style and the fact that he took a comic view of upper and middle class society led to his comparison with Waugh.

His sixth work, *A Dance to the Music of Time* is planned as a set of four trilogies. Ten volumes so far have appeared: *A Question of Upbringing* 1951, *A Buyer's Market* 1952, *The Acceptance World* 1955, *At Lady Molly's* 1957 (all P), *Casanova's Chinese Restaurant* 1960, *The Kindly Ones* 1962, *The Valley of Bones* 1964, *The Soldiers' Art* 1966, *The Military Philosophers* 1968, *Books Do Furnish a Room* 1971.

In this poetic novel Powell is clearly influenced by Proust. His narrator, Nicholas Jenkins, imagines the passage of time as a formal dance in which people appear and reappear unexpectedly and in surprising combinations. This is the novel's central image.

Jenkins is an extremely intelligent, thoughtful man, a connoisseur of pictures and a novelist vividly aware of the limitations of our knowledge of others, even of our closest friends and of the dangers of forming stereotyped ideas of people. He has an insatiable desire to understand what motivates human action, particularly how we are influenced by the thirst for power and by a love of adventure. Jenkins's gradual realisation of the complexity of life is expressed poetically through the references to paintings: as a young man he is usually drawn to Renaissance and Baroque works with classical subjects, as he becomes 'less ascetic, intellectually speaking more corrupt per-

haps and recognises that individuals live in different ways that all human beings—even at close range—are equally extraordinary—he refers increasingly to paintings of other periods.

The novel whose action opens in the early 1920s with a flashback to 1914 and has now reached the period following the second world war contains an enormous range and variety of characters. Each volume introduces new figures.

Powell has the most sensitive ear for nuances of speech. His novel leisurely but never dull contains passages of brilliant comedy.

Alan Sillitoe (b 1928)

Sillitoe's first book, *Saturday Night and Sunday Morning* 1958 (Pan), is among the better of a number of novels of working class life which appeared in the late 1950s and early 60s. Others include Keith Waterhouse's *There is a Happy Land* 1967 (P), Billy Liar 1959 (P), Barstow's *A Kind of Loving* 1960 (P) and David Storey's *Flight into Camden* 1960 (P).

Arthur Seaton, the hero of Sillitoe's novel, is a beligerent young worker in a Nottingham bicycle factory. He sees life as a continual battle for survival and feels particular hostility towards the forces of the Establishment. Seaton's hero is Boris Karloff, but his deepest satisfaction comes from a quiet day's fishing and a country walk with his girl friend.

The novel is uneven in quality, but its occasionally cheap and sensational language appropriately suggests the influence of Seaton's favourite films and much of the dialogue is vigorously realistic. The rural scenes reflect the influence of Lawrence who also came from Nottinghamshire.

Saturday Night and Sunday Morning was followed in 1959 by a volume of stories containing a fine nouvelle, *The Loneliness of the Long Distance Runner*, which gives the book its title. Sillitoe's later novels, which have been generally less favourably received by critics, include *The General* 1960, *The Death of William Posters* 1965 (both Pan), *A Tree on Fire* 1967, *A Start in Life* 1970.

C P Snow (b 1905)

Strangers and Brothers—11 vols 1940-70 P

In the course of this sequence the narrator, Lewis Eliot, rises from humble beginnings to success at the Bar at Cambridge and in the Administrative Civil Service. While this is clearly not an autobiographical work, the course of Snow's own career as a scientist, don and civil servant has followed a similar pattern.

One of the strengths of these volumes derives from the fact that Eliot is an unrepudiated observer of his friends and colleagues' behaviour. We feel he prefers some men to others, but rarely does he judge any of them.

The volumes follow no strict chronology and only two, *A Time of Hope* and *Homecomings*, are concerned directly with Eliot's personal life. The other books of the sequence are each centred on the life of one of Eliot's friends or acquaintances. The best of them all is *The Masters*, where an account of the election of the Master of a Cambridge college becomes an image of political life. The other volumes have a less perfect form and vary in quality, but all are of documentary interest in that they deal with such subjects as the making of the first atomic bomb and the painful decisions in which scientists and civil servants were involved at that time.

Wole Soyinka (b 1934) See also Section I

The Yoruba poet and dramatist Soyinka has published one novel which has lately been awarded the *New Statesman's* triennial prize for African and Caribbean fiction

The Interpreters 1965 Pa

In this original highly enjoyable novel Soyinka writes about a group of young Nigerian artists and intellectuals. The narrative is arranged in solo and choral sections now reflecting the experience of individuals now that of the group. The work has two main themes which are expressed through complex symbols. The first is the characters' struggle to discover and express the relationship between their traditional culture and contemporary Nigerian society. The second is the need for a fearless commitment to the search for truth. Soyinka includes some highly comic episodes and sketches of dishonest and selfish people. Particularly memorable are an encounter with a German reporter who likes to pretend he is American a party given by the Ogunzors an ignorant snobbish Nigerian don and his wife and the ridiculous behaviour of Fassyi who accuses his charming wife of behaving like a bush girl from a London slum. Soyinka takes a poet's delight in vivid and inventive use of words and is particularly skilful in his treatment of comic dialogue.

Muriel Spark (b 1918)

Since the appearance of her first *nouvelle* *The Comforters* (P) in 1957 Mrs Spark has published eight others the latest being *The Driver's Seat* 1970. She has also written one full length novel *The Mandelbaum Gate* 1965 (P) short stories a play verse and critical works.

Mrs Spark is an entertaining writer likely to be enjoyed particularly for the tart economy of her language and for her keen observation of absurd and grotesque behaviour and speech. But most of her work is slight and *The Mandelbaum Gate* suggests that she is indeed unable to treat characters or themes in depth or at any length.

Her early *nouvelles* are strange mixtures of comedy of manners and surrealist fantasy her later tales melodramatic rather than surrealist. Most of them illustrate Mrs Spark's interest in violent death a subject she sometimes treats with naive callousness. Her most satisfying work to date seems *Memento Mori* 1957 (P) which chronicles the reactions of a group of elderly people to mysterious telephone calls telling them to remember you must die. Only in this book and to a lesser extent in *The Prime of Miss Jean Brodie* 1961 (P) does Mrs Spark show much imaginative sympathy for human weakness. However Professor Kermode has suggested that her three books *The Prime of Miss Jean Brodie* *The Girls of Slender Means* 1963 (P) and *The Mandelbaum Gate* add up to the most distinguished achievement of any British novelist since the war and perhaps those of us who would question this opinion have not yet learnt to appreciate Mrs Spark's techniques.

William Styron (b 1925)

A native of Virginia one of the former slave states Styron is particularly concerned with the theme of slavery as an emotional or spiritual condition. He implies that it is responsible for the immaturity brutality and ugliness of much American life and suggests that it stems primarily from the Americans' heritage of militant repressive and self-righteous Puritanism.

Styron's weakness is his tendency to illustrate rather than to explore his novels' themes and many of his characters are too cerebrally conceived, yet even in *Set This House on Fire* his least successful work Styron remains an impressive novelist. The architecture of his books

three of which are very long is most skilful and all his work is illumined by a poetic gift for capturing the atmosphere of an event or scene and embodying fleeting visual impressions in vivid precise images.

Lie Down in Darkness 1948 Co

The events of this novel take place on the day of Peyton Loftis's funeral but most of the book consists of long flashbacks through which we learn about the lives of Peyton and her unhappy parents and come to understand why she committed suicide.

Styron implies that the Loftises story is symbolic of life in the southern States and that the latter is itself a paradigm of American life in general. However the novel does not sustain the weight of this interpretation for although the characters arouse our pity they never attain the stature of representative tragic figures that such a theme demands. Nevertheless this is a remarkable novel to have been produced by a writer of twenty three. Its strength comes from Styron's gift for presenting individual scenes illustrated in the novel's brilliant opening paragraphs and in episodes such as the account of Peyton's wedding.

The Long March 1952 P

The narrative of this very short book gives an account of the relationships between two Marines recalled for service during the Korean war with which they have no sympathy and their Colonel a regular officer whose avoidance of any sign of emotion has earned him the sobriquet of Old Rocky. Here Styron writes of the slavery of military life and the corruption and brutality it engenders but his underlying theme is the dilemma of liberals who born into a generation of conformists are thus trapped in a predicament which personal insurrection could if anything only make worse and yet to acquiesce in it would be to become like cannibals hardly men at all. The passion with which Styron expresses this dilemma makes *The Long March* his masterpiece.

Set This House on Fire 1960

Themes from the previous books are here combined with a sweeping condemnation of the moral and spiritual anarchy of contemporary American life but the novel remains essentially a *roman à thèse* and of the three main characters only Kinsolving a drunken artist and ex soldier becomes more than a blueprint and even so the parallels Styron suggests between him and Oedipus seem grotesquely inappropriate. Nevertheless the novel is well worth reading for its incidental poetry. It contains brilliant evocations of the beauty of the Italian countryside and of rural Virginia the hideousness of American cities and the languor of New York on a Spring Sunday.

The Confessions of Nat Turner 1967

This is an imaginative reconstruction of the life of the leader of an abortive slave rebellion. The story is told in the first person as Nat awaiting trial looks back over the events of his life and explains why he decided to murder his white masters. Nat himself is not a fully convincing figure but minor characters are and Styron is particularly successful in his portrayal of the liberal Judge Cobb whose predicament recalls that of the marines in *The Long March*.

William Trevor (b 1928)

Trevor's most recent novel *Mrs Eckdorf in O'Neill's Hotel* appeared in 1969. It tells how the neurotic Mrs Eckdorf a professional photographer searching for material of human interest is led to the run-down O'Neill's Hotel in Dublin. Here she finds a source of comfort and she believes true goodness in Mrs Sinnott the

deaf and dumb nonagenarian proprietress who loves and accepts people for themselves and avoids making any attempt to manipulate or coerce them

This novel is a development from Trevor's early bizarre comedies *The Old Boys* 1964 *The Boarding House* 1965 and *The Love Department* 1966 (all P). Like them it is written with delightful elegance and precision but whereas in the earlier books Trevor sometimes seemed a rather callous observer of humanity in *Mrs Lel dorf in O'Neill's Hotel* he imparts a sense of sympathetic understanding of even his least attractive characters

John Updike (b 1932)

Updike a novelist and short story writer from Pennsylvania has a genuine and congenial talent for recreating the atmosphere and daily life of rural New England. His early ambition was to be a painter and he retains an artist's eye for precise visual detail but unlike Jane Austen another miniaturist of country life Updike seems to lack a sense of his own limitations as a novelist. He sometimes spoils his work by decorating it with superfluous symbols and fails when he ventures outside the rural American scene which is the source of his inspiration

The Poorhouse Fair 1958 P

Set in an old people's home on the day of its annual fair this short novel creates a vivid impression of life in the 'poorhouse' and of the characters of its inmates and its unimaginative and ambitious young director

Rabbit Run 1960 P

At twenty six Rabbit Angstrom still lives in the imaginative world of his schoolboy triumphs at baseball and flees from his responsibilities to his wife children and mistress

Again Updike vividly evokes the atmosphere and scenes of his story and his minor characters are convincingly sketched. The novel's weakness derives from its author's ambiguous attitude towards his protagonist

The Centaur 1963 P

The prize winning *The Centaur* which covers two days in the lives of a schoolmaster and his son displays Updike's greatest strengths and weaknesses. Alternating chapters of the narrative are written like those of a conventional realistic novel. They are vivid and highly comic. In the other chapters all characters are referred to by names drawn from classical myth and apart from the two main characters who are always referred to as Chiron and Prometheus these names are inconsistently applied and serve merely to confuse. As Arthur Mizner has remarked the realistic sections of the book are so well written that they cannot be connected in any but the most sterile and mechanical ways with this mythological superstructure

Of the Farm 1965 P

Here Updike reverts to the wholly realistic manner of his early novels to evoke the tensions which arise when Joy is accompanied by his new second wife and her son visits his possessive elderly mother who singlehandedly runs the family farm.

Couples 1968 P

This is a sad comedy of the boredom of the lives of a group of middle-class couples who have 'retreated' to the country a boredom they relieve only by sports and frivolous sexual encounters, and are therefore shocked when two of their number have a serious 'affair' and are repudiated by their respective partners

As in Updike's earlier novels the details of everyday life are beautifully captured but here his central characters are rather flatly drawn

Bech A Book 1970

Like Malamud's *Pictures of Fidelman* (qv) which it palely resembles parts of this book have already appeared as short stories. Bech the protagonist is a writer on a cultural tour and each chapter finds him in a different country. However Updike seems to have taken small pains to coordinate these stories and although parts of the book are amusing the total impression is of a rather careless pot boiler

Evelyn Waugh (1902-66)

Waugh's style is elegant and his novels are often amusing but they are generally superficial and marred by cruelty and distasteful snobbery. A popular writer of the 1930s he published nine novels after the War

The Sword of Honour trilogy (pub in 3 vols *Men at Arms* 1952 *Officers and Gentlemen* 1955 *Unconditional Surrender* 1961 (all P) revised and reissued as one book 1965)

Waugh's best novel this chronicles the experiences of Guy Crouchback during the Second World War. Crouchback welcomes the War which he feels will give his life the direction and purpose it has lacked since his wife deserted him. The first two volumes of the trilogy give a convincing impression of administrative incompetence during the early stages of the War and are occasionally very funny but they share the cruelty and snobbery of Waugh's other writing

The third volume is much better. Crouchback a cardboard figure until now comes alive and in a moving encounter with a refugee woman is forced to admit he became a soldier in order to evade the difficulties of his personal life and that he and others like him were as responsible as the enemy for the horrors of the War

Patrick White (b 1912)

White an Australian was educated in England where he took a degree in modern languages and has travelled widely in Europe and America. He is the author of plays and short stories as well as eight novels

The first of these *Happy Valley* 1939 is now unobtainable and White seems to regard it as worthless. His second *The Loving and the Dead* 1941 (P) is an uneven novel much influenced by the writing of Virginia Woolf but already displaying the extraordinary combination of vision and intensity and brilliant social comedy which characterises his post-war novels. *The Aunt's Story* 1943 *The Tree of Man* 1955 *Poss 1957* *Inders in the Charist* 1961 *The Solid Mandala* 1966 (all P) *The Vicevector* 1970

Like Golding's novels these are essentially religious poems but whereas Golding except in *The Spire* concentrates on man's loss of grace White is more concerned with his experience of awareness of the God above God who is both immanent and mysteriously transcendent. His vision of life as reflected in these novels is similar to that expressed by the existentialist theologian Tillich. (v *The Courage to Be* Fo etc.)

White suggests that the 'conformism' of civilised life is inimical to goodness and exemplifies this in his treatment of the suburb Sarsaparilla, the setting of *The Solid Mandala* and of parts of most of his other novels. One of his plays and several stories *The Life of Sarsaparilla* is presented variously as comic sterile hypocritical cruel and evil. It is almost always hideous and invariably pitiful

White's main characters are regarded by most of their acquaintances as odd or stupid or mad. They are generally avoided and often feared and attacked because their essential innocence presents an intolerable challenge to the self-protective conformism of normal people. Notable exceptions are the tragic Nietzschean superman Voss and Waldo, one of the two main characters of *The Solid Mandala*, who is isolated by his own ignorance and pride.

All White's heroes and heroines suffer greatly and some die, but except in Voss he does not imply that suffering is a necessary condition of goodness, but rather that it is its inevitable concomitant. Joy returns to those who survive for all these novels emphasise though good must endure evil it never yields to it.

Another of the novels' recurrent themes is the difficulty of communication. White's heroes and heroines have the gift of profound empathetic communion but even the most educated of them find it all but impossible to articulate their experiences of joy and suffering. Most of them try to express themselves in other ways in painting, music, dance and increasingly through a wordless selfless love for people.

Like that of all major writers, White's style is highly individual and makes challenging demands upon his readers. His idiosyncratic punctuation and, in *The Tree of Man*, his frequent use of verbless sentences, seem attempts to reflect his characters' fumbling for understandings and expression of their experiences. Sometimes White makes no obvious distinction between his characters' expression of feeling and his own comment upon that expression. In *The Aunt's Story* such interplay between his own and his character's viewpoint is at times confusing but in subsequent novels his increasing mastery of technique adds to the subtle allusive qualities of his style. White takes a poet's delight in the metaphorical ambiguity of words. He is a master of ironic broths and epigrammatic wit.

To symbolise his main characters' quests for understanding and their progress towards it, White uses the age-old symbols of The Explorer, Traveller, Artist and Wise Simpleton. Other figures who repeatedly occur in his novels are a laundress, a harriard mother and a physically deformed spinster.

His finest novels *The Tree of Man*, *Voss* and *Riders in the Charcol* are those inspired by archetypal legends: the stories of the Creation and Fall (*The Tree of Man*), the expedition of the explorer Ludwig Leichardt (*Voss*) and the Crucifixion (*Riders in the Charcol*).

White's novels are by no means faultless. Sometimes his style seems self-conscious, at others empty rhetorical. Occasionally his symbolism is clumsy and in his last two novels there is a general loss of momentum combined in *The Solid Mandala* with what seems like gratuitous violence. Nevertheless White remains one of the most rewarding if also one of the most demanding of contemporary novelists. Each of his books is extremely complex. To write of them so briefly is to deal summary justice.

Angus Wilson (b 1913)

Although now best known as a novelist, Wilson first made his name with a volume of short stories *The Wrong Set*, 1949 (P). He has since published two other collections of stories and a play as well as six novels.

Wilson is an admirer of Jane Austen and at times the style of *Hemlock and After* is reminiscent of that of her novels. He has also long admired the writings of Zola and Dickens, on which he has published critical studies and recently he has expressed his growing appreciation for the techni-

cal skill of Virginia Woolf, an appreciation which is apparent in his latest novel *No Laughing Matter*.

A serious comic novelist, Wilson is merciless in exposing snobbery, hypocrisy and self-deception. However, he does not always achieve artistic transformation of his material. Thus although some of the finest parts of his work are in dialogue, some of his virtual conversations are as painful to read as they would be to endure in reality. Like Zola and Dickens, Wilson is horrified yet fascinated by cruelty and vulgarity. He has been called morbid by some critics. There are certainly times especially in *The Old Men at the Zoo* when the charge seems justified. But Wilson can also be deliciously funny as in his account of the Historical Association meeting (*Anglo Saxon Attitudes*).

His chief technical fault is a tendency to overload his novels with characters; he has no time to develop. His best works seem to be *The Middle Age of Mrs Eliot* and *Late Call*, in both his cast is limited. Some of the minor characters particularly working-class ones, appear caricatures and variations of the same types recur from one book to another. Wilson is nevertheless a writer of immense vitality. Each of his novels is quite unlike the others although they have certain common themes.

Obviously aware of the stresses imposed by the political and social problems of our century, Wilson was the first contemporary English novelist to write frankly of the homosexual underworld.

Hemlock and After 1953 (P) *Anglo Saxon Attitudes* 1956 (P) *The Middle Age of Mrs Eliot* 1958 (P) *Late Call*, 1964.

Each of these novels opens with the hero or heroine facing a crisis which compels him (her) to reassess his (her) adequacy as a person and in relation to others. Each endures considerable mental suffering. Bernard Sands, the novelist hero of the first book, dies before he can rebuild his life. Geoffrey Middleton, historian, connoisseur of pictures (*Anglo Saxon Attitudes*), Meg Eliot, widow of a successful barrister, and Sylvia Calvert, retired hotel manageress (*Late Call*), each in quite different ways, comes to find purpose and meaning in life.

Conversely, Meg's brother David, who has also suffered bereavement, withdraws to the petty isolation of his market garden. David is the most fully drawn of the several figures in Wilson's novels who indulge in ritual self-denial instead of facing facts (cf. Inge, *Anglo Saxon Attitudes*, Susan, *No Laughing Matter*).

The Old Men at the Zoo 1961 P

A political satire, the novel abounds in images of brutality and sadism. At the beginning of the book, the narrator Simon Carter, Administrator of the London Zoo, seems more imaginative and sensitive than his colleagues, but he becomes increasingly cold-blooded. The novel is an exploration of megalomania. Each of the Zoo's successive Directors is obsessed with putting his own pet schemes into practice and ruthlessly exploits his colleagues and the animals in his care, all of whom he regards as objects to be manipulated. The book closes, at the end of a British-European war, with Simon's canvassing his own appointment to the Directorship.

No Laughing Matter 1967

This ambitious, extremely long novel, written in a variety of styles and containing a short story and several plays, presents a panorama of twentieth-century life. Ultimately, it seems to fail because, since the narrative is divided among the lives of the six Matthews children and their parents constantly shifting from one to another, none of the characters is fully realised.

II TWENTIETH CENTURY POETRY

This section does not profess to be a full account of the poetry of the current century as that would not be possible within the present compass. The aim is rather to touch upon some aspects of the poetry and to suggest ways of approaching it.

I INTRODUCTION

The Poem as an Art Form expressive of Feeling

There is no short cut to the enjoyment of poetry. The only approach is an attentive reading poem by poem remembering always that the poet is attempting to express personal *feeling* through a pattern of words in which their order their associations and their verbal music are all of the utmost significance.

Coleridge described poetry as a more than usual feeling, with more than usual order and the reader may like to turn to the paragraph on the function of dramatic art (13) where reference is made to Susanne Langer's thesis that art gives form to our feeling, response to life. By this is meant not only emotion as distinct from reason but the whole grout of our response to life as human beings—what it *feels* like to use the senses to have emotions even what it feels like to think.

Such feeling response cannot adequately be conveyed by logical discourse. How often we hear the phrases 'I mean' 'You know' from speakers who implicitly acknowledge that they are incapable of expressing the inexpressible through the medium of prose discourse and must rely on the sensitivity of their hearer to interpret their feeling. The artist's task is to translate the inarticulate cry into significant images, patterns and forms which convey their import with precision and beauty.

It is perhaps easier for us to see how the painter the sculptor or the musician can do this and how like Henry Moore they may resolutely refuse to say what their work means for to limit it to meaning is to divert attention from its unique value its numinous feeling quality. But the poet in his subtle and difficult art must use as his material words and grammatical structures which themselves have meaning from which they cannot be divorced. Although possible meanings of individual phrases must be established the modern literary critic eschews any attempt to state what the poem as a whole means. He attempts rather to explicate the poem to unfold its hidden implications to make clear its significance as a whole. We must remember first and foremost that a poet normally uses words not literally but with a figurative meaning. He loves to speak of one thing as if it were another. The best approach is first to read the poem as a whole and then re-read it with particular attention for the special import of the individual figures of speech.

Special Difficulties of Twentieth century Poetry

Poetry of the current century presents the reader with special difficulties. Hitherto however strange or elaborate the imagery in most poems prosaic statements and a rational framework could be discerned but from about 1910 even these were often discarded, so that an even greater receptivity is demanded of the reader.

Drastic Social Changes in the Era between the Wars

For a fuller understanding of modern poetry we should return to the vital period between the wars when the masters Yeats and Eliot were developing new insights and techniques and setting standards which have not since been equalled.

Inevitably the poetry of the time reflected on temporary changes in society. The Georgian

Books of Verse 1911–22 illustrate how the familiar rural tradition was becoming outworn and it was now to be maintained by only a few poets Hardy being the most distinguished and influential. For England was fast becoming a predominantly urban society and the imagery of the countryside inevitably used by Shakespeare Wordsworth and Keats was becoming no longer relevant sometimes incomprehensible to the town dweller.

In France fifty years earlier Baudelaire (1821–67) had drawn inspiration from the city both in his preoccupations and in his imagery. In England it was the genius and originality of Ezra Pound (b 1895) and T. S. Eliot (1898–1965) with their highly original experiments in theme and style who now gave direction to a new kind of poetry urban sophisticated and cosmopolitan.

Other social factors had their influence. The horror and futility of the First World War the Communist revolution the economic slump the decline in religious faith the discoveries of Freud all contributed to the collapse of the old stable surerities and left poets profoundly shaken and searching for new values and effective modes of expression.

Pound Eliot and W. B. Yeats (1865–1939) all repudiated the current bourgeois values of wealth and worldly success which with the rapid growth of industry commerce and advertising were becoming ever more deeply entrenched. Stigmatised by Matthew Arnold in *Culture and Anarchy* as Philistine in 1869 they are the corrosives of art and cause the poet to feel out of sympathy with society.

Pound and Eliot and later William Empson (b 1906) consciously directed their poetry to a select minority. Intellectual and satirical it makes no appeal to facile emotion. The familiar metres and rhymes have been discarded. The elliptical syntax the complex organisation of the imagery the erudite references to other cultures all make demands. A phrase like Pound's 'His Penelope was Flaubert' is not immediately clear. Such poetry is not intended to be lapped up by a complacent bourgeoisie.

Another aspect of the new style was indifference to accepted canons of respectability in subject and in diction a candour about sex (encouraged by the work of Freud) and the use of vernacular and slang which in the Sixties sometimes degenerated into scurrility.

Aesthetic influences

(a) *The development of the romantic aesthetic*

One of the prime causes of the change in poetic method is not social but aesthetic the clarification and evolution of the Romantic concept of poetry.

In *Romantic Image* Frank Kermode has pointed out that from the time of Coleridge there has been a growing conviction in writers such as Keats Blake Pater and Yeats that the artist in whom the powers of imagination are allied with a passionate sensibility has a special quality of apprehension and expresses his intuitions in a unique way. The work of art according to this theory is original essentially whole in itself an aesthetic monad and resists analysis into form and content. Without ulterior purpose or utility its only *raison d'être* is to be. The image Coleridge insisted is essentially vital not mechanistic but organic and it has itself been presented by organic images notably that of the tree and the dancer.

(b) *The French Symbolists*

In his *Azels Castle* 1931 Edmund Wilson discussed the aims of the French Symbolists and

their stimulus to English writers including Yeats and Eliot

The Symbolist leader Stéphane Mallarmé attempted to create a new idiom for poetry. Supremely disinterested, a saint of literature, he wrote little himself but at his modest weekly receptions he gently expounded his influential views to such visitors as Whistler, Degas, La forgue, Valéry, Claudel, Gide, Wilde, George Moore, Yeats and Debussy.

Influenced by Poe, Mallarmé cultivated in his poetry a suggestive indefiniteness blurring the distinctions between the actual world and that of dream and reverie. Debussy's well-known transposition into music of his *L'après midi d'un faune* wonderfully conveys his evocative and amorphous imagery.

Like Poe the Symbolists were much concerned to reproduce in their poetry the flow of music and they were much influenced by Wagner. They came even to discard the classical Alexandrine and to develop *vers libre*. In the cult of indefiniteness they would like Poe confuse the perceptions of the senses. Poe for instance hears the coming of darkness.

What was the purpose of these experiments in poetic language? The Symbolists were so much preoccupied with the unique quality of individual experience and with the complex and evanescent nature of consciousness that they eschewed anything so commonplace as a description or statement as a falsification of experience and endeavoured instead to express unique and transitory feelings by suggestive images and symbols fastidiously chosen and patterned with exquisite care. The time honoured rational framework of poetry was being scrapped so that it was becoming irrelevant to speak of the meaning of a poem.

(c) *The problem of objective validity in symbolist art*

The symbolism was not of the commonly accepted kind such as the dove with the olive branch. Each poet deployed a highly idiosyncratic symbolism peculiar to himself in order to express his own intensely personal feelings. Such symbols were, says Wilson, really metaphors detached from their subjects. Inevitably such poetry is not easy to interpret. An example easily available in English is Valéry's *Le Cimébère Marin* translated by our Poet Laureate, Day Lewis as *The Graveyard by the Sea*.

The basic problem for the Symbolist poet is to find an imagery both true to his own unique experience and also in some way significant and communicable. That is the supreme test.

It is fascinating to see how English poets such as Yeats, Eliot, and Sitwell stimulated by the French experiments, tackle this problem and give objective validity to an intensely subjective vision.

II SOME INDIVIDUAL POETS

1 The Masters of the Decade between the Wars.

W B Yeats (1865-1939)

References are to the *Collected Poems* (Macmillan)

Yeats's influence is exerted not by the happy romantic Celtic twilight verses between 1889 and 1904 but by the complex, shrewy poems appearing between 1910 and 1939. Although in traditional verse forms they establish Yeats as a great master of the modern symbolic image.

Brought up by a sceptic father, Yeats had sought from early youth for some significance to life in heterodox mysticism such as theosophy and the Kabbala, and above all in Blake. Their highly developed systems of symbols stimulated his innate sensitiveness to this intuitive form of insight and expression and encouraged him to develop his gift for waiting on images as they arose from the deeper regions of his mind. Arthur Symonds whose *The Symbolist Movement in Literature* was published in 1899, introduced him

to the work of Mallarmé and other French symbolists and confirmed him in his poetic approach which he now realised was part of a European movement.

To give objective validity to highly subjective images he used several techniques. Following Shelley's example he would repeat the same symbol throughout the body of his work so that one poem illuminates another. The symbol thus seen in perspective reveals new facets of its significance sometimes even contradictory aspects.

For example in early poems the rose signifies not only love and in its Rossetian form a mystic union but also Ireland, beauty both sensual and intellectual and the beauty of Maud Gonne with whom Yeats remained hopelessly in love.

A ruined Norman tower which Yeats had converted into a dwelling recurs from 1919 in many poems. Its basic significance is the artist's isolation but it also suggests Milton's Platonist Shelley's visionary prince, Samuel Palmer's lonely light and Yeats's own Anglo-Irish heritage. He was greatly concerned to give the symbol solidity and firm outline and stresses the tower's emblematic winding gyres spirals treadmill of a stair and the grey stone fireplace with an open hearth and the fire of turf of simple hospitality.

He juxtaposed exalted symbols with the singularly down to earth motifs which he deployed with increasing frequency. The indignity of age is a sort of battered kettle at the heel or a tattered coat upon a stick until in his emblematic protagonist Crazy Jane he presents the ultimate in physical destitution inspired by poetic frenzy.

Yeats also relied on archetypal images from the Great Memory to which we respond unconsciously. In *The Two Trees* (p. 54) he follows Blake in his use of the image of the tree which develops from the Kabbala and the Biblical Tree of Life. To Yeats it came to embody the organic nature both of all life and of the imagination or reality intuitively perceived by the artist as whole and vital. Yeats like Blake contrasted this imaginative vision with the abstractions of the discursive intellect and his most perfect expression of the work of art as an organic and indissoluble unit occurs at the climax of *Among School Children*. Here in a passage of multiple import he marries the image of the tree to that of the dance.

O chestnut tree great rooted blossomer
Are you the leaf the blossom or the bole?
O body swayed to music, O brightening glance
How can we know the dancer from the dance?

Yeats's poetry was also supported by a frame work of mythology whether of Gaelic legend, Greek mythology as in *Leda* and *The Swan* or as in much of his more mature work that of his own private system, which he expounded in his prose *A Vision* 1926. For instance he saw history as opposing cycles of 2000 years each cycle being a reversal of the previous one. He represented this diagrammatically by opposing gyres his gyre being the spiral traced on a cone.

But Yeats's finest poems even when the meaning depends on his private hinterland are still valid and intelligible in themselves. *The Second Coming* affects us through the singular clarity and force of the metaphors and the controlled energy of the rhythm.

somewhere in sands of the desert
A shape with lion body and the head of a man,
A gaze blank and pitiless as the sun,
Is moving its slow thighs while all about it
Reel shadows of the indignant desert birds.
The darkness drops again but now I know
That twenty centuries of stony sleep
Were vexed to nightmare by a rocking cradle
And what rough beast its hour come round at last

Slouches towards Bethlehem to be born?

Yeats is the poet of paradox and often quoted

Blaise Without contraries there is no progression His own life was one of manifold tensions a perennial fluctuation between contemplation and his active participation in Irish politics and art. (He was Production Manager of the Abbey Theatre and was made a Senator)

A dominant theme is the dichotomy between the sensuous living and the creation of immortal works of art the latter symbolised by Byzantium in two splendid poems Here he reflects the sensual music of whatever is be, often born and dies or the fury and the mire of human veins for monuments of unaging intellect symbolised by Byzantium with its gold mosaic the starlit or the moonlit dome and the golden smug, bird a miracle in glory of changeless metal (pp 217-280)

Yet in the contemporary *Dialogue of Self and Soul* p. 265 the poet opts for life however sordid

I am content to live it all again
And yet again if it be life to pitch
Into the frog spawn of a blind man's ditch

Paradoxically the splendour of Yeats is the unresolved conflict. In poem after poem he passionately faces his dilemmas personal political artistic metaphysical never to rest in a comfortable final solution but forging instead enigmatic and arresting images of universal experience

T S Eliot (1888-1965)

The poems referred to are contained in *Collected Poems 1909-1962* (Faber)

Thomas Stearns Eliot is a poet who makes considerable demands on his readers. To some extent these may be met by using critical works such as George Williamson's *A Reader's Guide to T S Eliot* but a poet who apparently needs to be read with a key is a little daunting so it is perhaps as well to decide what these demands are and whether they are much heavier than or very different from those made by other poets

Eliot studied philosophy at Harvard (1906-10) and continued his studies abroad at Munich the Sorbonne and later (1914) Oxford. He had been interested for a time in Eastern philosophy but chose not to indulge his inclination as he considered it might hinder his participation in Western culture and in Western culture from the Greeks onward he was steeped. One must expect from a writer who read so widely in Greek Latin French Italian and German as well as English a range of references beyond what is usually expected of the well educated arts graduate and from a poet trained in philosophical disciplines one should further expect subtlety and precision. These expectations are met and the poetry most of it at least well repays the effort of the reader who must follow a technique in which unity is achieved not by a framework of narrative or sensory description or even a logical sequence of thought but by imaginative association where several layers of thought and feeling are fused

Eliot's first book of verse *Prufrock and Other Observations* was published in 1917 although the title poem *The Love Song of J Alfred Prufrock* had been published separately in 1915 in America, apparently at Ezra Pound's instigation. This poem is probably one of the easiest to begin with and yet touches on ideas and experiences with which Eliot was continually concerned

At the head of the poem is a quotation from Dante's *Divine Comedy*. It is relevant to the poem in that its speaker says that he has answered Dante only because he believes that his answer cannot be taken back to earth since no one ever leaves the deep abyss alive. Eliot's character is first seen making his way through a maze of streets, a scene which reflects Prufrock's state of mind. The correlation between the exterior situation and the interior state is suggested clearly

Streets that follow like a tedious argument

He arrives at a party we hear, at a distance as it were the sounds made by the guests but in the

foreground are Prufrock's thoughts. He is sadly aware of the impression he makes the figure he cuts and thus inhibits him so that for fear of being misunderstood he withdraws and does not ask his question. This much is achieved with great delicacy. His fear of being ridiculous mis understood and becoming old together with the wry mockery of self deprecation

Though I have seen my head [grown slightly bald]

brought in upon a platter

I am no prophet—and here's no great matter makes him a sympathetic character. But there is more to the poem than the failure of a middle aged man. Prufrock's city is characterised by fog smoke drains restlessness its citizens use prepared faces and formulated phrases perhaps to defend themselves against any contact with reality which might disturb their pleasant but futile lives measured out with coffee spoons. In this society people may talk of culture but it is the culture of the past the present remains unproductive and people remain isolated and unable to communicate. The sea images which replace the fog are less picturesque but possibly more emotive the fog may be understood as Baudelaire used it to represent the Unreal City half dead but the sea image comes from the English tradition and the Mermaids may recall Donne's satirical love poem *Go and Catch a Falling Star* while the last three lines remind us of Keats's concluding lines in *Ode to Melancholy*. It is these two recurrent images of fog and sea which form the framework of the poem and which suggest the breadth of the poet's intention

The same loneliness and sense not only of failure but of there being nothing worth succeeding in is expressed in *Gerontion* perhaps more bitterly. This meditation on approaching death is inconclusive

I would meet you upon this honesty

but if the speaker is not sure what death means he is even less sure of the meaning or value of human life. The references to windy spaces (line 15) and

Gull against the wind in the windy straits

suggest Claudio's speech on the terrifying prospect of existence after life has ended in *Measure for Measure*. The quotation at the head of *Gerontion* comes from the Duke's speech in that play when he tries to steel Claudio's nerve for his coming execution by proving that life is not worth having. Eliot's Old Man seems to agree but the Duke's Christian assurance for he is disguised as a friar evokes no response in him for Christ the Word cannot communicate through the swaddling darkness. Whatever the crucifixion may have once meant has been adulterated beyond recognition and there is nothing to replace it

The Waste Land published in 1922 established Eliot as a major figure on the contemporary scene. Some reviewers thought it a literary hoax because of the elaborate use of allusion and quotation (in several languages) as well as the lack of any formal structure. Charles Powell in *The Manchester Guardian* dismissed most of it as so much waste paper. F L Lucas thought the unhappy composition should have been left to sink itself but it is not easy to dismiss in three lines what is being written about as a new masterpiece. Those who thought it a masterpiece praised its honesty its emotional unity and above all its projection of twentieth century malaise the plight of a whole generation. At all events Eliot's reputation as a poet increased though controversy may be raised again in a different form now that Eliot's original notebooks are being studied. It has been known for some time that Ezra Pound to whom *The Waste Land* is dedicated, recommended considerable revisions mostly in the form of cuts which Eliot accepted but the extent was not known until the John Quinn papers were made public in 1988

However the version published in 1922 certainly impresses one with a sense of disillusion and anti climax. The old pre war Edwardian world has

been destroyed perhaps it was never very satisfactory but there seems to be nothing to replace it. The theme is repeated at intervals throughout in different ways sometimes as a dead land where the sun beats a place where the cisterns are empty the wells exhausted an empty chapel with dry bones. The crowds on London Bridge walking through the fog are dead for each is locked within himself. The modern Cleopatra seated in her burnished chair is surrounded by erotic symbols but the romantic suggestion of the gold Cupidon is disturbed by *synthetic* perfume and destroyed by recollection of the rape of Philomel. This Cleopatra's life is pointless and unreal she can only look forward to a game of chess. At the other end of the social scale there is the prostitution of personal relationship to the level of having a good time and instead of new life abortion. The nymphs are departed indeed.

But at the end there is perhaps some hope in

The awful darning of a moment's surrender
Which an age of prudence can never retract.

At all events it seems particularly relevant to this half of the twentieth century when the possibility of our producing a waste land seem even greater.

In 1927 Eliot became an Anglican. His poems *Ash Wednesday*, *Journey of the Magi*, *A Song for Simeon* reflect his new belief and his gift for using allusion is directed towards Christian sources. Thus in *Ash Wednesday* single lines from well known prayers and responses from the Ave Maria and The Reproaches of the Catholic Good Friday service are used technically in the same way that the repeated and echoed phrases in earlier poems are used to give unity but as the phrases that Eliot uses are ones that are frequently repeated in the liturgy of the church the poem provides for some readers a kind of ceremony.

His major work after this is *Four Quartets* where he is concerned with the Christian philosopher's interpretation of time meaning as expressed through words and salvation. They are full of paradoxes and though a progression of thought may be traced in the four each Quartet may be read as a unity in itself. The mood of the second Quartet *East Coker* is sombre and the fear of nothingness the dissatisfaction with the shabby equipment of contemporary language recalls parts of *The Waste Land* but the fourth *Little Gidding* named after the home of a seventeenth century community of Anglican mystics is more hopeful.

All manner of thing shall be well.

Considerable time needs to be spent on these poems if the complexity of the thought is to be appreciated but the pattern of the verses, the delicate manipulation of the metre may be enjoyed by the reader who is prepared to listen carefully.

2 Edith Sitwell (1887-1964)

In *The Scarlet Tree* Sir Osbert Sitwell vividly describes his elder sister's early background. She was saturated in English poetry read Baudelaire at the age of seventeen and her governess Helen Rootham, translator of Rimbaud, became her life long friend.

Sitwell interprets her early verses in *Facade* 1922 as abstract patterns in sound, written in reaction against 'rhythmical faccidity and verbal deadness'. She experimented indefatigably with the effect on rhythm and speed of subtle and elaborate patterns of rhyme, assonance and dissonance successfully capturing dance rhythms. Some verses were set to music by Walton and accompany the well known ballet.

Like the French Symbolist writer de l. Isak Adam (author of *Axel*) Sitwell also deliberately juxtaposed words that clash in a protesting combination. She adopted the synaesthesia practised by Poe and the French Symbolists, transferring the language of one sensation to indicate the experiences of another as when morning light appears as creaking or whining. In later poems we find such phrases as 'the dust brays

or purple perfumes of the polar Sun repeated from Rootham's Rimbaud.

Elegant and mannered the butterfly verses of *Facade* lack inner significance yet they gave Sitwell the expertise to express intense feeling in her later poetry.

Gold Coast Customs 1929 is the counterpart of Eliot's *Waste Land*. Both express the poet's revulsion from modern society by finding an objective parallel in primitive ritual. Sitwell writing during the Depression was most dismayed by the heartlessness of the city which she images through the bygone Customs in Ashantee where once at the death of an important person hundreds of the poor were butchered that their blood might lave his bones. This Reeling appalling/Cannibal mart symbolises the contemporary sacrifice of the poor demanded by the spiritually dead epitomised by Lady Ramburgen smart plague cart, massively indifferent to the destitution of the slums where driven by Want a cruel rat gnawing there the pathetic prostitutes. The calico dummies/Flap and meet.

The ghastly Customs the desolate slums violently alternate and reflect each other in the kaleidoscope of nightmare relentlessly maintained by the rhythm of savage drum beat and fevered pulse.

Although the metre and repetitive phrasing have an obsessive monotony the impact of the poem which foretells the sick thick smoke from London burning is unforgettable.

In *Street Songs* 1942 Sitwell was in command of images of arresting clarity. Two poems on the Raids are incidentally a clear vindication of Symbolist technique for both are extended metaphors detached from their subjects.

In the ironic *Lullaby* of despair the Pterodactyl the steel bird which fouls its nest, has devastated the earth and only the Baboon is left to mother the surviving child.

Still Falls the Rain boldly uses the superbly simple image of rain, heavy reiteration and a thudding tolling rhythm stressing the dark monosyllables.

Still falls the Rain—
Dark as the world of man black as our loss—
Blind as the nineteen hundred and forty nails
Upon the Cross.

It is a poem of profound and universal compassion for man and beast and also of religious faith for the Rain is also Christ's blood shed in suffering love and illumination.

In later publications Sitwell develops the long ode written from the vantage of the poet-seer matured by suffering. Like Yeats she was now giving her work coherence by playing variations on key symbols. Some images appear strained but the most effective are drawn from familiar sources as the Bible history myth and mankind's most primitive experiences—of sun, earth, bees, grain, fruit, metals, and of cold and warmth always emblematic for her of evil and good. On these she sets her idiomatic stamp.

She constantly opposes two kinds of gold. In *Harvest* she celebrates the warm gold of the laughing heat of the Sun and the ripe bearded fire/Of wheat reflecting divine energy and love. In *The Song of the Cold* 1945 she laments the lust for the cold, destructive metal that possesses Dives and the saints of Mammon who ache with the cold/From the polar wastes of the heart the cold of hell.

Deeply shaken by Hiroshima, Sitwell wrote *The Shadow of Cain* 1947. The theme of the title poem is fission and envisages Mankind's migration into the Cold from Cain's first murder up to Hiroshima when the Primal Matter/Was broken and 'to the murdered Sun a totem pole arose of dust in memory of Man. The crisis stirs an obscure prescience of impending calamity of a

profound fusion between the two aspects of Man Lazarus embodiment of gold corn and human suffering and Dives of money and dilemma. But the two gods fight and finally unite in a new resolution and hope

This visionary poem is sometimes declamatory and the bleak *Dive for the New Sunrise* with its terse antitheses is more immediate and moving

After *The Shadow of Casa* haunted ever by the shadow that fell on Hiroshima she yet continued to write poems that are hymns of praise to the glory of Life

3 Some Poets of the Thirties

Wystan Hugh Auden (b 1907)

Auden was educated in a small public school Gresham's and later went to Oxford. Here he met Stephen Spender, Louis MacNeice and others who formed temporarily a group of political poets most of whom were involved in the Spanish Civil War

His first book of poems appeared in 1930 and was well received. After the publication of *The Ascent of F6* a play which he wrote in collaboration with Christopher Isherwood, he was expected to become a major figure in English poetry. However, later books of verse were less well reviewed and in the mid thirties the *Scrutiny* critics complained of his triviality, irresponsibility and lack of maturity. He left England in 1939 and has since lived in America and Austria. As Eliot took out British citizenship Auden took out American and again like Eliot he accepted Christianity though perhaps in a less orthodox form.

Auden's interest in politics and the violence of political struggle is reflected in much of the imagery he uses as well as more directly in such different poems as *The Shield of Achilles* and *Alonso to Ferdinand: Let History be my Judge* is an early example of his political verse. Russia's forced collectivisation policy is the event which roused the feeling expressed here but it is not directly referred to so that if it were not for the date the reader would not necessarily associate the poem with that particular policy but with the harsh repression of any uprising or with the invasion of a weak country, the tragedy of the imposition of impersonal policy on the ignorant and defenceless is suggested and the callous self justification of the powerful ironically revealed. A later poem, *The Unknown Citizen* satirises the omnipresence of the bureaucratic state and possibly the twentieth-century obsession with statistics. It begins with particular people as in the dramatic monologues and some of the elegies or poems for Auden's friends. In his less successful poems he tends to be either too clever (like Gratiano's in *The Merchant of Venice* his reasons are like two grains of wheat hid in two bushels of chaff) or too anxious for effect. In the same way his dry humour and use of anti climax is very effective at times but sometimes the very ease with which he seems to do it betrays him and the joke becomes irritating.

Apart from anthologies in some of which he is fairly well represented the Penguin edition which is the poet's own selection of verse makes a good introduction to his work. There is one collected edition of *Collected Shorter Poems 1927-1957* (Faber). Otherwise his large production of verse is to be found in about ten small editions (all Faber). A recording of the poet's reading of his own poems has been made by Caidmon and is well worth listening to.

Stephen Spender (b 1908)

Collected Poems 1928-1952 (Faber)

Spender's first poems, up to 1933 are mainly concerned with or derived from the ideas of Marxism and Freud. There are the stormy calls

Oh, comrades let not those who follow after
—The beautiful generation that will spring from our sides

Let them not wonder after the failure of banks
The future of cathedrals the declared insanity of our rulers

We lacked the Spring like resource of the tiger—

but what the comrades are to do is not clear. One does not expect a political manifesto in a poem but the vagueness of the sentiment of equal like the shine from the snow is irritating. It is difficult to take the optimism of such a poem as *The Funeral* seriously yet if it is meant to be ironic the wit needs clarifying. Spender's early impact and placing in literature doubtless derived from his political and psychological idiom but the poems which have stood the test of time are those which are more personal e.g. *My parents kept me from children who were rough* which strikes a more convincing note.

From 1936 onwards his poems are often about war, first the Spanish Civil War and then the Second World War. He is moved by the fate of the ordinary civilian particularly the young who became involved in battles they do not understand. The defencelessness of the young soldier is poignantly conveyed and in poems such as *Ultima Ratio Regum* he links the greed of society particularly the middle classes with the slaughter of the innocent.

The belief in socialism and the brotherhood of man rather glibly expressed in the earlier poems is still present but the tone of poems from this later period is compassionate. Spender rejects the easy outright condemnation of either war or the enemy and refuses to glorify war by celebrating heroism. In fact there are no easy answers to the questions proposed in these exploratory poems. In the introduction to his collected volume Spender speaks of them as being malleable and possibly this unfinished sense is both their weakness and strength.

C Day Lewis (b 1904)

Collected Poems 1954 (Cape) and various short later volumes

Of this group of poets C Day Lewis is probably the most prolific. He began to publish in 1925 and was associated with Auden and Spender up to the outbreak of the Second World War. His early poems show Auden's influence—the use of colloquialism, the experiment with verse form and the concern with politics. How alien this type of verse was from his own vein may be seen from the symphonic poem *A Time to Dance* 1935 where in one section he parodies the Apocalypse to describe the division of society into the exploiters and the exploited.

I saw

The director placing explosives under the infant's cradle the editor keeping a nursery for snakes

The scientist madly driving against traffic lights the artist studying his acne in a pocket mirror

Later he imitates the rhythm of popular songs

As his expectation of a Marxist solution faded and involvement in politics lessened due at least in part to the Spanish Civil War and then the World War, he developed a quieter tone and used the more traditional verse forms. His work is generally polished if not particularly vigorous. His translation of Virgil's *Aeneid* in 1952 was generally well received and in addition he has written several books of criticism as well as detective stories under the pseudonym Nicholas Blake.

Louis MacNeice (1907-63)

The Collected Poems of Louis MacNeice edited by R. Dodds, 1967 (Faber)

Louis MacNeice was born in the same year as Auden, published his first book of poems in 1929 and continued writing fairly steadily until 1963. He was actively interested in politics of an idealist left wing type and was influenced by the contemporary interest in psychology. In 1937 he joined

with Auden in publishing *Letters from Iceland* but after Auden's departure for America in 1939 the partnership if so it may be called dissipated itself. MacNeice continued his work as a lecturer in classics and also wrote several radio scripts for the B.B.C. including the verse drama *The Dark Tower*.

His longest non-dramatic poem is *Autumn Journal* which covers events from August to December 1938. Apart from its obvious historical interest—he clearly records his impressions of and fears about the political events of that period—it is an unusually convincing poem. It has an authenticity as of Pepys's diary but it is pervaded by a philosophical tone which brings details into focus. The verse flows smoothly most of the time but the metre is not intrusive in fact as an example of the art to hide art it is of its kind hardly bettered.

Observation of significant detail, personal reflection on the political situation as it affects society as a whole, reminiscence and a private transitory reaction are skillfully interwoven. For instance he has spent most of the night anxiously assessing the possibilities of war breaking out and at six o'clock hears various sounds of people going to work—

And I notice feathers sprouting from the rotten
Silk of my black
Double eiderdown which was a wedding
Present eight years back
And the linen which I lie on came from Ireland
In the easy days

and I wonder what the morning
Papers will say
And decide to go quickly to sleep for the morning
already

Is with us the day is to-day

Humour often directed at himself gives his poetry a sharpness which it might otherwise lack since he seldom seems driven by an overpowering inspiration. His use of colloquialisms and cliché is less frequent than Auden's and possibly because of this more effective. The opening to his tribute to his friend in *The Casualty* is a good example of this and the rest of the poem illustrates MacNeice's gift for characterisation for expressing admiration and regret without sentimentality.

In spite of disappointments and disillusionments MacNeice remained liberal in outlook, and sympathetic to many views (see for example, *Bottle-neck* and *The Conscription*). He may not be a major poet but he has integrity and a respect of poetry reflected in his skillful handling of metre which makes him an honest poet rather than a brilliant dilettante.

4. Dylan Thomas (1914-58)

Collected Poems 1952 (Dent)

In many ways his poetry could hardly be more different from that of the previous group. Dylan Thomas as a poet at least was hardly touched by social concerns, and was uncommitted politically. His poems do not exhibit the intellectual force which Auden's and Eliot's do. If these last mentioned poets derived their inspiration from metaphysical poets like Donne, then Dylan Thomas may be said to derive his from poets such as Southwell or the visionary Blake.

The theme of much of his poetry is the oneness of all creation, the unity of experience, the human is intermingled with the divine, flesh and spirit are indivisible and the world we inhabit is not essentially different from us.

The force that through the green fuse drives
the flower
Drives my green age that blasts the roots of
trees

Is my destroyer

Death is incipient in birth and so in love—

"The word flowed up translating to the heart
First characters of birth and death.

Sometimes death is accepted as in *And death shall*

have no dominion and in *A Refusal to Mourn* at other times Thomas seeks to defy death by protest.

Go not gentle into that good night

Old age should burn and rave at close of day

The condensed language particularly the use of verbal nouns and adjectives reflects sometimes not very clearly this sense of the unity of creation.

His use of language though much imitated remains recognisably his own. He uses cosmic symbols: sun, heaven, stars, sea, fire and wind, images such as womb, bird, blood and tomb, colours: green, gold, red, blue and black. Much of his verse—that is when it is not overloaded with images—evokes kaleidoscopic pictures and the rhythmic metrical pattern is generally strong which is possibly why he was in his own lifetime a popular poet. He draws too a great deal on biblical symbols and this coupled with the use of formal sound patterns, assonance, rhyme and alliteration gives his verse an incantatory sound which is quite impressive. Finally he has resuscitated the transferred epithet technique.

At his best he has produced moving but un-sentimental celebrations of childhood. *Fern Hill* *Poem in October* *Over Sir John Hall* some religious poems for example the unusual pattern poem *Vision and Prayer* and some occasional poems.

Very good recordings of Thomas's readings of his poems have been made by the Caedmon group.

5 The English "Movement" Poets.

Robert Conquest's anthology *New Lines* 1956 (Macmillan) marks the next stage—sometimes called the Movement—in English poetry. In his introduction Conquest remarks that groups of poets typical of their decade were presented to public fire by anthologies which took up definite positions. His anthology was prepared in the belief that a genuine and healthy poetry of the new period has established itself. The main objections he makes to criticism published from the beginning of the Second World War is that it encouraged poets to produce diffuse and sentimental verbiage or hollow technical pirouettes. The poets he chose apart from being contemporary have in common only the acceptance that poetry is written by and for the whole man, intellect, emotions, senses and all, and on the technical side a refusal to abandon rational structure and comprehensible language. However in their reaction against the undisciplined expression of emotion the Movement poets tend to go to the opposite extreme. Their writing is highly intelligent and often witty but generally seems more cerebral than truly imaginative, lacking the inspiration of passionate feeling. The wry self-mockery and hopelessness of much of Larkin's verse is typical of the work of the Movement as a whole but some younger poets, notably Gunn and Hughes who were early associated with the group have gone on in another more vigorous direction.

Philip Larkin (b 1922)

The North Ship 1945 *The Less Deceived* 1955 *The Whitsun Weddings* 1964 (all Faber)

Like Dylan Thomas, Larkin recalls his childhood but he refuses to romanticise it. In *I Remember I Remember* he speaks of Coventry where he was born as a place where his childhood was 'unspent' and he lists the crises commonly associated with precocious youth which did not occur. So far the poem is mildly ironic but its end is disturbing.

You look as if you wished the place in Hell
My friend said judging from your face Oh
well,
I suppose it's not the place's fault "I said
Nothing like something happens anywhere "

The sense of emptiness of opportunities untaken, of flatness is a theme of much of Larkin's verse e.g. *Work*, *Departures*, *Triple Time*, but the self-mockery and irony give the work a pointedness.

which most elegaic verse lacks when he reflect on the past he is neither nostalgic nor resentful. A conversational tone is used to attract attention but the language is a selection of the language really used by men. He does not indulge in the vague slipshod phrasing of what passes for the conversation of ordinary people. A good example of his style is *Church Going* a reflection on the future of churches when they fall completely out of use which raises the whole question of belief (in values neither immediate nor material).

Thom Gunn (b 1929)

Fighting Terms 1954 *The Sense of Movement* 1957 *My Sad Captains* 1961 *Touch* 1967 (all Faber)

At first glance Gunn's poetry seems as contemporary as the morning paper. Titles such as *On the Move* subtitled *Man you gotta Go Black Jacks* *Elvis Presley* suggest rightly that his poetry is rooted in the present but not in such a way that it will be incomprehensible when the present has become the past. He is concerned with violence in the classical world in *The Wound* and *Helen's Rape* in the sixteenth century in *A Mirror for Poets* and in the twentieth century in *Claus von Stauffenberg* in personal relationships as well as public but it is not an unthinking surrender to mere excitement or admiration of brutality but a recognition of its necessity.

In this society the boundaries met
Of living danger death leaving no space
Between

Yet at this point they found
Arcadia a fruitful permanent land
(*A Mirror for Poets*)

In *Saint Martin and the Beggar* Martin the saint of man must learn to fight before he can grow and then without hesitating he halves his cloak to cover the beggar. He is justified because his action was natural. The tragedy of modern man lies in his inability to marry instinct intention and action.

One joins the movement in a valueless world

At worst one is in motion and at best
Reaching no absolute, in which to rest
One is always nearer by not keeping still
(*On the Move*)

Ted Hughes (b 1930)

The Hawk in the Rain 1957 *Lupercal* 1960 *Wodwo* 1967 *Crow* 1970 (all Faber). There is also a small book of *Selections* from Hughes and Gunn (Faber).

There is some similarity between these two poets. Both have worked in America, both have developed a concise style which mirrors the toughness of their attitude to experience their refusal to make the rough places smooth.

This said the differences become more apparent as their individuality becomes clearer. Hughes for example uses animal imagery far more than Gunn. He approaches the human dilemma through the animal but the animal is not a mere cipher. In *Pike* for instance the pike exists in its own right and since Hughes did collect animals in his boyhood the incident

Suddenly there were two Finally one

With a sag belly and the grim it was born with is probably true. But the recollected night mare at the end of the poem goes beyond a boy's terror. The pond he fished, the eye the dream darkness are symbols both of the violence which lay in his own subconscious and that of the human race. The human being too is potentially a killer from the egg.

In the other poems Hughes is searching for an identity. In *An Otter* the otter

'Gallops along land he no longer belongs to
He enters the water by melting

At one level we have the hunt which loses and then finally catches the otter but at another level there is the self attendant and withdrawn the individual who does not take root.

Hughes's descriptive powers are certainly strong and sensuous and there are in his verses for children, *Meet my Folks* and *The Earth Owl* descriptions of people and creatures some of which are as strange and amusing as those of Edward Lear or Lewis Carroll. In the volume *Poetry in The Making* Hughes gives a fascinating account of the genesis of some of his poems and of his methods of composition.

6 The American "Confessional" Poets

The term 'confessional' poetry seems to have been used first by reviewers of Lowell's *Life Studies* poems which arose from their author's suffering a mental breakdown. It has since been applied to the work of Sylvia Plath and Anne Sexton which also derives from the immediate experience of mental illness and like *Life Studies* expresses feelings of guilt bitterness and isolation the material of the confessional or the psychoanalyst's couch.

The label 'confessional' is also used in a more general though allied sense to denote work in which the poet makes an uninhibited confession of hatred addiction lust or similar experience about which usually most of us are reticent. An extreme exponent of this genre is the Beat writer Allen Ginsberg a selection of whose verse may be found in *Penguin Modern Poets 5*.

In 'confessional' writing the poet's need to objectify his experience in order to give it artistic validity presents itself in an acute form. Its resolution demands the rare courage and technical virtuosity that Eliot displayed in *The Waste Land* and Lowell approaches in a very different way in *Near the Ocean*.

Robert Lowell (b 1917) See also Section I

Poems 1938-1949 (1950) *The Mills of the Kavanaughs* (1961) *Life Studies* (1955) *Imitations* (1961) *For the Union Dead* (1964) *Near the Ocean* (1967) *Notebook* 1970 Faber

In an interview published in J. Scully's *Modern Poets on Modern Poetry* Lowell records how he was early drawn to the work of Latin, Elizabethan and Jacobean poets. His own mature writing reflects the continuing influence of these early mentors with whom he shares an anguished sense of the fragility and transience of beauty and a revulsion from the brutal vicious materialism of the society in which he lives.

His first important work *The Quaker Graveyard in Nantucket* 1945 is an elegy for a cousin drowned while serving in the navy during the Second War. The poem presents this cousin as continuing the brutal tradition of the Quaker whalers of Nantucket and links him with Ahab the tragic deranged hero of Melville's *Moby Dick*. The vigour of the poem's language the musical skill with which Lowell evokes the sounds and atmosphere of the bleak Nantucket coast and the force of his revulsion from the whalers' obscene cruelty are immediately impressive. As Hugh B. Staples has noted in his valuable reference book, *Robert Lowell—the First Twenty Years* a central theme of the poem is 'human evolution, considered as a part of God's plan. Here as in much of his later work, Lowell shows the aggressive individualism of men bringing a return to primitive violence. The gentle pastoral stanza VI presents the ideal figure of the Virgin who 'Expressionless expresses God'. However this stanza lacks the force of the others. The affirmation of faith in the poem's concluding line is similarly less convincing than Lowell's expression of revulsion from the Quakers' primitive lust for power and wealth.

The poem's images have multiple significance. The whale 'is the whited monster' is at once

a symbol of Being Itself of the vengeful Jehovah and of Iesu Saviour. It is the victim of the sailors' greed and also the agent of their death and damnation a whited sepulchre an image of their corrupt faith. The sea is the god Poseidon, the earth shaker and also the primitive source of life and life itself hurt and fouled by man.

These and allied images take on new significance in Lowell's later poems where they replace the Catholic symbols of his early work as he strives to achieve a more flexible resonant style which will give objective validity to his vision. In his mature work the sea and water continue to symbolise life particularly the life of the spirit. Fish at times represent the primitive violence man has loosed upon the world but the fish is also an image of vitality struggling against the stone and bone crushing waterfall. Monsters become grunting yellow dinosaur steamshovels possessive dragons and the Gorgon a fearsome yet beautiful and pitiful tyrant and tyrannicide.

Lowell's use of such images is linked with his frequent evocations of the language and imagery of the Bible particularly the Old Testament and the Apocalyptic books beloved of the New England Puritans. He applies such language and imagery to the life denying creeds of the Puritans themselves and to all those who seek to dominate their fellows driving in stakes to command the infinite and creating God the Logos in their own image a tyrant with bloody hands. Lowell combines such Biblical allusions with references to Classical myths—particularly that of Perseus and Medusa—to give his work wider significance and fuller perspectives. He uses American place names with religious and historical associations: Mount Zion Concord Carthage, and writes of contemporary life in terms of that of Ancient Israel and Rome as in the following passage where the insistent rhythm the punctuation and feminine rhymes accentuate the image of the clumsy military machines irrevocably lurching toward their shattering end.

Hammering military splendor
top heavy Goliath in full armor—
little redemption in the mass
liquidations of their brass
elephant and phalanx moving
with the times and still improving
when that kingdom but the crash
a thousand forekins stacked like trash
(*Waking Early Sunday Morning*)

In his early verse Lowell imitated the metrical forms of Elizabethan and Jacobean poetry. His middle period was a time of experiment the dramatic monologues of *The Mills of the Kava Naughts* are written in more colloquial run on couplets similar to those of Browning. *Life Studies* and *For the Union Dead* contain a number of poems in free verse. His volume *Near the Ocean* marks Lowell's return to stricter metrical forms, using a stanza based on four couplets which he now deploys with the deceptive skill of a master. His earlier experiments with style and metre and the experience he has gained by writing plays and by recreating poems from Latin and other languages for the volume *Imitations* now enable him to write with vigorous simplicity and haunting beauty.

'Lost in the Near Eastern declivity
the tyrant and tyrannicide
lie like the bridegroom and the bride
the battering ram abandoned prone
beside the apeman's phallic stone
(*Near the Ocean*)

Although the autobiographical poems of *Life Studies* have been among the most widely noted of Lowell's work his later volumes seem of more lasting importance. They express a complex tragic vision of life in a black classic world of lost connections. We are all tyrants Mussolini was one of us Caligula is our namesake and tyrannicide itself a most arrogant form of tyranny bringing widespread suffering and destruction.

I have seen the Gorgon
The erotic terror
of her helpless, big bosomed body
lay like a slop
Wall-eyed, staring the despot to stone
her severed head swung
like a lantern in the victor's hand
(*Florence*)

Pity the monsters! Pity the planet all for
gone from this sweet volcanic cone

Lowell's recent poems express the anguish of our almost impossible quest for asylum peace. We are like a lot of wild spiders crying together/ but without tears. Innocence goodness and beauty life itself are as fragile as the orange and black/oriole's swinging nest. In *For the Union Dead* he suggests we can survive only by having the angry wrenlike vigilance which chooses death rather than savage servility or the security of a Mosler safe the 'Rock of Ages' that survived the blast. The ultimate test is whether we dare become alive enough to die.

Like Yeats Lowell has come to feel that we experience innocent joy only in the creation and contemplation of art. Exploring the frightening corners of the woodshed he creates from his lumber poems that give darkness some control evoking joy even while they sing despair.

Sylvia Plath (1932-1963)

The Colossus (1960) *Ariel* (1965) Faber

An American of German ancestry Sylvia Plath was married to Ted Hughes. Some of her early poems such as *Mushrooms* and *Sow* have an affinity with his but the most powerful influence upon her work seems to have been the encouragement she received from Lowell.

Like all poets she has power to make us see the world as if for the first time to enhance our awareness of life. She writes of poppies wrinkly and clear red like the skin of a mouth and bells that soberly bong out their names. Her world has the clarity of a primitive painting but the poems of *Ariel* make almost intolerably painful reading for they express the heightened vision and self mockery the frangible control of utter hopelessness. Their images are often grotesque and full of menace.

'Dawn gilds the farmers like pigs
Swaying slightly in their thick suits

White towers of Smithfield ahead
(*To them*)

The moon far from being a symbol of serene agape is a face

White as a knuckle and terribly upset
It drags the sea after it like a dark crime it is quiet
With the O gape of complete despair
(*The Moon and the Yew Tree*)

Plath's world is starkly coloured in red black white and the yellow of decay. She combines these images with allied symbols of energy death and living death blood the wren moonlight the winding sheet and the pupa. Her poems are haunted by a black father figure the Nazi panzer man of *Daddy*. The power with which she expresses her anguished vision derives partly from the simplicity of her metres and verse forms which

often have the insistent quality of nursery rhyme

Poems like *Daddy* and the allied *Lady Lazarus* are unlikely to be forgotten but in future others such as the title poem of *Ariel* and *The Arrival of the Bee Box* and *Elm* may be valued more highly. Our judgment is distorted by Plath's recent death and the knowledge that the harrowing poems of *Ariel* were the prelude to her second and successful attempt at suicide

Anne Sexton (b 1928)

Anne Sexton began writing in 1957. *Selected Poems* 1964 and *Love Poems* 1969 have been published in England by the Oxford University Press. She acknowledges a debt to Lowell and deals with the same kind of subject as Sylvia Plath

John Berryman (b 1914)

Homage to Mistress Bradstreet (1956) *77 Dream Songs* (1964) *Berryman's Sonnets* (1967) *His Toy His Dream His Rest* (1969) Faber

Berryman is the most distinguished of those poets to whom the label 'confessional' is applied in its more general sense. Technically he is a most inventive and ingenious writer and his work has enormous vitality. Some find it undisciplined and pretentious

The best of his early poems *Homage to Mistress Bradstreet* is cast in the form of a dialogue between Berryman and the 17th cent. immigrant Anne Bradstreet, a poet maquette with whom he feels tender affinity. We are on each other's hands/who care. Both of our worlds unhandd us

The total effect of the poem is of a conversation between two aspects of the same personality

In *77 Dream Songs* and *His Toy His Dream His Rest* Berryman develops the techniques he used in the earlier work to present multiple facets of a protagonist called Henry, a white American in early middle age who has suffered an irrevocable loss. These two books form a single work of three hundred and eighty-five lyrics. Together they present a kind of open-ended *Odyssey* of contemporary American life. They are often very amusing, often intensely irritating and their allusions to American society sometimes make them difficult for the English reader to follow, but they are compulsive reading and individual songs the painful 29 and 53 and the grotesque 91 for example remain fixed in our minds

Berryman's Sonnets is a sequence of poems about an unhappy love affair. It was written during the 1940s and has affinities with Meredith's *Modern Love*

Conclusion

Readers who are spurred by their study of the poets discussed here and wish to explore further will discover much to enjoy in the work of writers to whom space precludes more than reference. Robert Graves, Edwin Muir, R. S. Thomas, Peter Redgrove, the Americans Robert Frost, William Carlos Williams, Theodore Roethke, Elizabeth Bishop and Charles Olson. Penguin Books publish good anthologies *The New Poetry* and *Contemporary American Poetry* as well as two series *Penguin Modern Poets* which includes the work of many lesser English and American writers and another of major European poetry *Penguin Modern European Poets*

III TRADITIONAL VERSE PATTERNS

The poet's intensely individual music is played on the age-old instrument of metre and rhyme and the better we understand the instrument the keener will be our enjoyment of the poet's skill and genius

Even verse that cannot be called poetry—verse that is mechanical uninspired lacking that intensity of insight and expression that we recognise as poetic—even this mediocre verse can teach us something of the poet's instrument. A homely nursery rhyme like *Humpty Dumpty* can help us to appreciate the metre of *Ariel's* unearthly song. Where the bee sucks

It is for this reason that the following guide to versification throws its net wide gathering together for our consideration patterns as diverse as those of the medieval ballad and the modern Frenchified triolet of the flippant cleric and the grave blank verse of Wordsworth's *Prelude*

The following account of English verse is illustrated by quotations and by constant reference to the numbered poems in the new edition of *The Oxford Book of English Verse* 1939

Thus OBEV 16 means *Oxford Book of English Verse* New Edition Poem No 16

I. INTRODUCTION STRESS METRE AND RHYME

If we listen carefully to spoken English, we shall observe that there is a natural tendency to stress

some syllables more than others. In the following sentence for example the greater stress normally falls on the syllables whose vowels are marked with an acute accent which is the usual way of indicating stress

The express left Manchester at seven

It is obvious that in this sentence the stress falls in a quite haphazard way and it is for this reason that we recognise the sentence as prose for the essential difference between English prose and verse is that in prose the stress falls at random while in verse the stressed syllables occur according to some regular pattern

If we mark the stressed syllables in the following line from Wordsworth

And loud halloo and screams and echoes loud

It is immediately clear that the stress occurs regularly. The line is in fact composed of a simple stress pattern of an unstressed syllable followed by a stressed (e.g. and loud) which is repeated throughout

It is a regular pattern of stress such as this that in English verse constitutes what we call metre. Metre in Greek means simply measure, and it is always by stress that we measure our verse

Another feature that distinguishes our verse from prose is the use of rhyme although rhyme unlike metre is not essential to verse

II METRE

Different Kinds of Feet

In English verse the unit of stress pattern constitutes a foot the foot of verse being comparable to the bar of music

English verse uses several kinds of feet some of two syllables or disyllabic some of three syllables or trisyllabic and occasionally a foot of four syllables

Disyllabic feet are of four kinds

The **Iamb** consisting of an unstressed syllable followed by a stressed *e.g.* return

The **Trochee** consisting of a stressed syllable followed by an unstressed *e.g.* river

The **Spondee** consisting of two stressed syllables *e.g.* door mat

The **Pyrrhic** consisting of two unstressed syllables *e.g.* in the phrase into town into is a pyrrhic

Trisyllabic feet are of four kinds

The **Anapest** consisting of two unstressed syllables followed by a stressed *e.g.* as you wish

The **Dactyl** consisting of a stressed syllable followed by two unstressed *e.g.* archery

The **Amphibrach** very rarely used consisting of a stressed syllable between two unstressed *e.g.* delighted

The **Tribrach** still more rare consisting of three unstressed syllables *e.g.* last three syllables of incommunicable

A four syllabled foot is very occasionally found

The **Choriambus** which may be thought of as a trochee followed by an iamb *e.g.* Tóil for the brave

Different Kinds of Metrical Line

Based on the different kinds of feet are the different kinds of English metre which may be compared with the time in music

Disyllabic metres may be either iambic or trochaic for it is impossible to speak at any length using only pyrrhic or spondees and the most common trisyllabic metres are anapestic or dactylic Examples of different kinds of metrical line follow

Iambic Line

I stróve with nóne for nóne was wóth my strífe
[OBEV 584]

Trochaic Line

Hóme art góne and tá en thy wáges
[OBEV 150]

Anapestic Line

With a héy and a hó and a héy nonnó
[OBEV 147]

Dactylic Lines

Wit with his wántonness,
Tásteth death's bitterness
[OBEV 177]

Amphibrach Lines

Most friendship is feigning, most honesty
Then heigh ho the holly
This life is no t jolly
[OBEV 146]

Choriambic Line

Kentish sun B,ng stood for his king

Variations in Metre

Satisfying poetry is rarely entirely regular. Mechanical regularity is soon wearisome to the ear and is a characteristic of doggerel. The poet satisfies our love of rhythm in a more interesting and subtle way by introducing all kinds of variations and inversions while at the same time maintaining the throbb of the basic metre. An account of the chief variations follows

Eision

Eision is the suppression in pronunciation of a vowel or a syllable

In the anapaestic line

The Assyrian came down like a wolf on the fold
the second foot appears to have four syllables but in fact the *i* of *Assyrian* is elided or dropped before the *u* as shown by the little bracket. The elision of *i* which is pronounced *y* and known as consonantal *y* is especially common and occurs in such words as familiar opinion. Elision is often shown by the use of the apostrophe as in heav'n. In heav'n we see one of the many conventional elisions of poetry like *his* *twas* *didst* *o'er* *eer* *laurest* and many more

Substitution

Substitution is the use of a foot different from that of the metre in which the poem is written. In the following examples we can see the effect on iambic verse of some common substitutions

Of a Trochee

Stiffen the sinews summon up the blood
Shakespeare Henry V

Here the initial trochee gives force and emphasis

Of a Spondee

Rócks cáves lákes fens bógs déns and shádes
of death

In this extraordinary line of Milton's the spondees slow down and weight the verse

Of a Pyrrhic

They fly forgóttén as a dream

Here the pyrrhic in the third foot gives lightness to the line

Of a Dactyl

Cháttering his téeth for cóld that did him chíll

When a dactyl replaces an iamb it is usually in the first foot as in this typical instance from Spenser where the dactyl gives emphasis and variety to the line

Of Anapæstis

And the cómng wind did róar more lóud
And the sáils did sigh like sáde
[OBEV 562]

The initial anapæsts in these two lines from The Ancient Mariner give an effect of hurry and speed

Additional Syllable

An additional syllable may be added to either the beginning or end of a line

Feminine Ending

A feminine ending is an extra unstressed syllable that is added after the final stressed syllable of a line giving a gentle falling inflexion. It is often used in blank verse and is a marked characteristic of Shakespeare's later plays e.g.

Be not afraid the isle is full of noises
Sounds and sweet airs that give delight and hurt
not

Anacrusis

Anacrusis is the use of an extra syllable before the first regular foot of the line

Dropped Syllable

It sometimes appears that a line is a syllable or syllables short until we realise that a suspense or pause occupies the time that would have been taken by the missing syllable. The dropped syllable can be indicated by the caret mark thus ^. The following technical terms are used for lines that are short of syllables

Catalectic Line

This leaves off in the middle of the last foot as in the trochaic line

Ever lét the fáncy róam

or the dactylic line

' Rings on her fingers and bells on her toes

The catalectic line is common in trochaic and dactylic verse for it is in keeping with the tendency of English verse to end on a stressed syllable

Acephalous Line

This omits the first syllable of the line as in the anapestic line

That hóst with their bánners at sunset were
seen

The Cæsura

The cæsura is a special kind of pause quite different from that which indicates a dropped syllable. It is a pause about the middle of a line and is usually indicated by a pause in the sense e.g.

Both hungered after death both chose to win
or die

Two Ways of Describing Metre**The Classical**

The actual names that we have been using for the different kinds of feet and metres are derived from Greek. It is most important however to realise that in the classical languages they had a different meaning for Greek and Latin verse was written on a quite different principle from ours and was scanned according to the quantity or length of the syllable and not according to stress. Thus an iamb in Greek and Latin consisted of a short syllable followed by a long marked thus u - and a trochee of a long syllable followed by a short marked - u

In English verse the length of the syllable is totally irrelevant. For instance the line

Póllý pút the kítte ón and léts have téa
begins with five trochees all consisting of two short syllables

The application of Greek words to English metres is confusing only if we forget that in English verse the criterion is stress

The Modern

Some writers however prefer new ways of describing our verse and the most popular method is set out below

A foot is called a period

A disyllabic metre is called duple or double time

A trisyllabic metre is called triple time

A period with the stress on the first syllable is said to be falling

A period with the stress on a second or third syllable is said to be rising

III RHYME

Another thing that gives a formal pattern to English verse and distinguishes it from prose is rhyme. It is not essential to our verse much of our verse being rhymeless

Rhyme is a similarity in sound in words occurring normally at the ends of lines. In true rhyme the last stressed syllable and consonants following it are the same while the sounds preceding the stressed vowel are different e.g. cage/page pleasure/treasure

The Types of Rhyme

The most familiar division of rhyme is into masculine feminine and triple rhyme but we also distinguish broken and Leonine rhyme

Masculine Male or Single Rhyme

The final syllable is stressed e.g. cage/page joy/boy

Feminine Female or Two syllabled Rhyme

The syllable before the last is stressed and the final syllable unstressed e.g. pleasure/treasure bending/lending

Triple or Tumbling or Three syllabled Rhyme

The antepenultimate syllable is stressed. Triple rhyme is normally found in light or comic verse like that of W. S. Gilbert. This punning Epitaph on a Dentist employs it

Stranger! Approach this spot with gravity!
John Brown is filling his last cavity

In The Bridge of Sighs [OBEV 662] Hood dares to use it in a serious poem with such rhymes as scrutiny/mutiny

Broken Rhyme

Broken rhyme where more than one word is needed to complete the rhyme is occasionally used e.g. estate/their gate

Leonine Rhyme

Although rhyme normally occurs at the end of the line we also find verse where the first half of the line rhymes with the second. This device known as Leonine rhyme is frequently used in Coleridge's Ancient Mariner [OBEV 562] e.g.

The ice did split with a thunder fit

Poetic Licence in Rhyme

The difficulty of rhyming in English is considerable for many words have not a single rhyming word some have only one others very few. Certain licences are therefore allowed to the poet in the following ways

Eye Rhyme or Printers' Rhyme

Here words rhyme only to the eye as love/move Keats in Meg Merrilies uses rushes/bushes

Identical Rhyme

Here the same syllable or word is used twice so that the line rhymes with itself *e.g.* part/im part [OBEV 562] universe/this verse [OBEV 817] The use of rhyming words spelt differently but pronounced identically is also a poetic licence *e.g.* wright write right

Cockney Rhyme

Keats use of Cockney rhymes has been much criticised *e.g.* mourn/torn faces/uses briar/attire There is still considerable difference between Northern and Southern pronunciation of English and many eminent poets have availed themselves of a Southern pronunciation in rhyming dawn/morn although in the North of England the *r* of morn would be sounded

Assonance

Assonance is sometimes used instead of rhyme and occurs frequently in early folk poetry and less formal verse It consists in a similarity in the accented vowels and those which follow but not in the consonants *e.g.* feet/creep skin/swim

Perversion of Rhyme

Modern poets following Wilfred Owen have sometimes used a deliberate perversion of rhyme which should not be confused with assonance Wilfred Owen opens his bitter poem *A Terre* with the following stanza

Sit on the bed I'm blind and three parts shell
Be careful can't shake hands now never shall
Both arms have mutined against me—brutes
My fingers fidget like ten idle brats
The deliberate falsity of rhymes like shall/shall and brutes/brats conveys Owen's horror at the disintegration and collapse of the First World War

Recording of Rhyme Schemes

The conventional way of noting rhyme schemes is to call the first series *a* the second *b* and so on Normally each new series is indented *e.g.*

Joyful joyful!	<i>a</i>
When virginity	<i>b</i>
Seeks all covet	<i>a</i>
Man's affinity	<i>b</i>
Fate all flowery	<i>c</i>
Bright and bowery	<i>c</i>
Is her dowery!	<i>a</i>
Joyful joyful	<i>a</i>

W S Gilbert Yeomen of the Guard

IV THE STANZA

Some poems are divided into groups of lines which strictly speaking are called stanzas though in popular language they are often known as verses Generally the stanzas of a poem are uniform but sometimes they are varied as in Milton's *Lycidas* [OBEV 325]

V ENGLISH VERSE FORMS

English poetry uses an immense wealth of verse forms distinguishable from each other by the predominating metre and also by the pattern of rhyme and the kind of stanza—or by the absence of rhyme and stanza. An account of these follows

Iambic Metres.

The metre most natural to the English language is undoubtedly the iambic

With Iambic Pentameter as Basis.

The iambic pentameter of five stresses and ten syllables also called the iambic decasyllabic line

is more used than any other and is the basis of the following forms

Blank Verse Blank verse consisting of unrhymed iambic pentameters is the metre of Shakespeare's plays Milton's *Paradise Lost* Wordsworth's *Prelude* and Tennyson's *Idylls of the King* In the hands of such masters it is a most flexible instrument especially when diversified with the eleven syllabled line with a feminine ending Shakespeare used the metre with increasing freedom though it must be remembered that some apparent variations are due to the different pronunciation of Elizabethan times

The following lines of blank verse occur in Wordsworth's *Prelude* Book III He is describing his rooms in St John's College Cambridge

And from my pillow looking forth by light
Of moon or favouring stars I could behold
The antechapel where the statue stood
Of Newton with his prism and silent face
The marble index of a mind for ever
Voyaging through strange seas of Thought
alone

Heroic Couplet The heroic couplet consisting of iambic pentameters rhyming in pairs was in Elizabethan times called *riding rhyme* possibly because it is the metre of The Prologue of Chaucer's *Canterbury Tales* and of many of the tales themselves It became the most fashionable metre of the eighteenth century when it was used by Pope Goldsmith and Johnson Keats later employed it in *Lamia*

The *Closed Couplet* was in the heyday of the couplet's vogue considered the most polished and correct Here the sentence form exactly coincides with the couplet and the rhyme has a channelling effect *e.g.*

True ease in writing comes from art not chance
As they move easiest who have learned to dance

Pope was the supreme master of the closed couplet and eschewed variations such as enjambement or the Alexandrine

Enjambement is a variation used by poets before Pope's time and revived by the Romantic poets In enjambement the sentence flows over from one line or couplet to the next and the click of the rhyme is submerged *e.g.* Keats' description of *Lamia* in her serpent form with skin of dazzling hue

And full of silver moons that as she breathed
Dissolved or brighter shone or interwrought
Their lustres with the gloomier tapestries
Keats *Lamia*

The *Alexandrine* another variation is a line of six iambic feet Dryden made frequent use of the Alexandrine but Pope parodied it in the brilliant line that serves as a mnemonic.

A needless Alexandrine ends the song
That like a wounded snake drags its slow length along

The *triolet* another variation consists of three lines rhyming together The third line is frequently an Alexandrine

Rhyme Royal. Rhyme royal has seven iambic pentameters, rhyming ABABBCD Used by Chaucer in *Troilus and Cressida* [OBEV 14 and 15] and Shakespeare in *Lucrece* it was revived by Massfield in such poems as *Dauber*

Spenserian Stanza. The Spenserian stanza has eight iambic pentameters followed by an Alexandrine rhyming ABABBCD Invented by Spenser in *The Faerie Queene*, it was used by Byron in *Childe Harold* Keats in *The Eve of St Agnes*, and Shelley in *Adonais*

Elegiac Stanza The Elegiac stanza has four iambic pentameters rhyming ABAB. It is also called the heroic quatrain, quatrain meaning a four-lined stanza. This form is best known through Gray's *Elegy* [OBEV 465].

Omar Khayyám's Stanza

The Omar Khayyám stanza receives its name from its use by Fitzgerald in his translation of the *Divan*. It has four iambic pentameters rhyming AABA.

Ottava Rima Ottava rima also called the octave stanza has eight iambic pentameters rhyming ABABABCC. It was used by Byron in *Don Juan* and by Keats in *Isabella*.

Terza Rima Terza rima has stanzas of three iambic pentameters with a linking rhyme scheme, e.g. BCB CDC etc. The concluding stanza is rounded off with an extra line rhyming with its central line, e.g. DEDD, constituting in effect a heroic quatrain. Used by Dante the verse has been adapted by English poets. Shelley's *Ode to the West Wind* [OBEV 617] uses modified terza rima, the final rhymes being DEDD.

The Sonnet A sonnet has fourteen iambic pentameters. Perfected in Italy by Petrarch who died in 1374 it was introduced into England in the sixteenth century. There are two chief types of sonnet.

The Petrarchan or Italian sonnet has an octave of eight lines rhyming ABBAABBA, followed by a sestet of six lines where some variety of rhyme schemes is found. The strictest Petrarchan sonnets have either two tercets of three lines each with rhymes CDCDE or else three pairs of lines rhyming CDCDCD.

An example of sestet rhyming CDCDE is Milton's *On His Blindness* [OBEV 827].

Examples of sestet rhyming CDCDCD are Wordsworth's *Upon Westminster Bridge* [OBEV 534] and Keats' *On First Looking into Chapman's Homer* [OBEV 641].

Not all of these examples observe the natural pause between octave and sestet which is characteristic of the strict Italian form and many of our finest sonnets depart from the original rhyme scheme in both octave and sestet.

A lesser known Petrarchan sonnet by Keats

To one who has been long in city pent
His very sweet to look into the fair
And open face of heaven—to breathe a
prayer

Full in the smile of the blue firmament
Who is more happy when with heart's content
Fatigued he sinks into some pleasant lair
Of wavy grass and reads a de bonair

And gentle tale of love and languishment?
Returning home at evening with an ear
Catching the notes of Philomel—an eye
Watching the sailing cloudlet's bright career
He mourns that day so soon has glided by
E'en like the passage of an angel's tear
That falls through the clear ether silently

The Elizabethan or Shakespearean sonnet consists of three quatrains with the rhymes ABAB/CDCD/EFEF concluded by a couplet rhyming GG. The couplet often clinches the thought.

Examples are Shakespeare's sonnets [OBEV 155-174] and Keats' last sonnet [OBEV 644].

Other Iambic Metres

Many of our iambic verse forms use a shorter or longer line than the pentameter.

The Octosyllabic Couplet The octosyllabic couplet consists of lines of four stresses and eight

syllables and the lines rhyme in pairs. English poets like Marvell have used this metre effectively, e.g. *A Garden* [OBEV 305 see also OBEV 367 370]. It is the metre of Massfield's *Everlasting Mercy* and Reynard the Fox.

The Ballad There are two chief kinds of ballad metre.

(a) *Strict Ballad Form* consists of stanzas of four iambic lines, the first and third with four stresses and the second and fourth with three with the rhyme scheme ABCB. The fine old ballads *Sir Patrick Spens* [OBEV 381] and *The Wife of Usher's Well* [OBEV 388] are in this metre. Coleridge in *The Ancient Mariner* [OBEV 562] shows how many varieties of stanza can be based on the simple ballad stanza.

Fourteeners is the name given to a form which is simply a rearrangement of the ballad quatrain as a rhyming couplet of two iambic lines with seven stresses as in Macaulay's *The Armada*.

(b) *Less Strict Ballad Form or Long Metre* consists of stanzas of four iambic lines each with four stresses, the rhyme scheme being ABCB or ABAB. Many ancient ballads such as *Thomas the Rhymer* [OBEV 379] are of this type.

"In Memoriam" Metre This is the metre of Tennyson's *In Memoriam* is like the less strict ballad metre in having four iambic lines each with four stresses but its rhyme scheme is ABBA.

Short Metre Short metre rarely used consists of iambic quatrains, each line having three stresses and the rhyme scheme being ABCB.

English Hymn Metres Most English hymns are written in short iambic lines and English hymnology names them according to the number of syllables. The most common are

Common Metre or 6886 with rhymes ABAB, e.g. *O for a thousand tongues to sing* [Songs of Praise 595].

Long Metre or 8888 with rhymes ABAB, e.g. *When I survey the wondrous cross* [Songs of Praise 133].

Short Metre or 6886 with rhymes ABCB, e.g. *Blest are the pure in heart* [Songs of Praise 456].

Double Iambic Metre When we are accustomed to hearing verse we come to realise that stresses are not always of equal weight. It is possible to distinguish in these fourteeners of Massfield a major stress marked and a minor stress marked.

Oh some are fond of Spanish wine and some are
fond of French
And some'll swallow tar and stuff fit only for a
wench

Massfield's *Captain Stratton's Fancy* [OBEV 939].

The lines have in fact four major stresses and between the major stresses intervene three syllables of which the middle has a minor stress. It is this alternation in the weight of the stress which gives its characteristic swing to such a poem as Chesterton's *The Rolling English Road* [OBEV 930].

Trochaic Metres

Pure Trochaic Metre

English poets seldom use a pure trochaic metre partly because of the difficulty of rhyming and partly because the continual feminine ending that it involves is not pleasing to the English ear. A few very short lyrics in this metre can be found as Browne's Song *For her gait if she be walking* [OBEV 251] but the only poem of any length is Longfellow's *Hiawatha* and the metre

of this *tour de force* tends to sound monotonous. It consists of unrhymed lines each of four stresses
e g

Like a yellow leaf in autumn
Like a yellow water lily

Modified Trochaic Metre

Ever since the Middle Ages our poets have contrived to combine the advantages of a trochaic metre and of a masculine ending by the simple expedient of shortening the last foot of the line to a stressed monosyllable. This catalectic or shortened trochaic line is found both in couplets and in stanza forms. *The seven syllabled trochaic couplet* also called the *trochaic tetrameter* consists of these catalectic or shortened lines rhyming in pairs and is a gay tripping measure as in some passages of Milton's *L'Allegro* [OBEV 318].

Háste thee nymph and bring with thee
Jest and youthful Jollity

Keats uses the metre in *Bards of Passion* and *Fancy* [OBEV 637 and 638].

Lyrics in modified trochaic metre are often found. Herrick uses the seven syllabled lines rhyming in pairs in *Cherry Ripe* and other lyrics [OBEV 284, 279, 280, 281]. Edmund Spenser in *Forerather* [OBEV 965] uses it in a stanza rhyming ABABCC. George Herbert in his lyric *Discipline* [OBEV 291] brilliantly combines five and three syllabled lines rhyming ABAB e g

Thrów away Thy róð
Thrów away Thy wráth
O my Gód
Táke the géntle páth

Further Variations in Modified Trochaic Metre

The modified trochaic line is especially subject to further variation

(a) It is often combined with a pure trochaic line e g in Hunt's poem *Jenny Kiss'd Me* [OBEV 600] where the catalectic and the complete trochaic line alternate regularly

(b) It often has an extra unstressed syllable preceding it (anacrusis) as in the second of these lines from Keats' poem *Fancy* [OBEV 638].

In a dárk conspírácy
To í banish Eýen fróm her ský

The line that results might well be taken for iambic and there are some passages in English poetry such as lines in Milton's *L'Allegro* [OBEV 318] which can be described either as irregular trochaic or irregular iambic lines! It depends on what the hearer judges to be the *basic stress*.

Double Trochaic Metre

Corresponding to double iambic metre there is a double trochaic metre. W. S. Gilbert effectively uses it in many of his patter songs as in *Ferdinand and Elvira* e g

Thén we lét off páper cráckers éach of which
contáined a mótto
And she listened while I réad them till her
móther told her nó to

These lines, like those in double iambic metre, have four major stresses (marked) and between the major stresses three syllables of which the middle carries a minor stress.

A modified double trochaic metre where the last foot is shortened to a stressed monosyllable can be recognised in Tennyson's *Locksley Hall*, or in Lewis Carroll's verses in *Alice in Wonderland*.

Will you wálk a líttle fáster? sáid a whítting
tó a snáil

Trisyllabic Metres Generally

Because of the irregularities incident to verse in anapaestic, dactylic and amphibrachic it is not

easy to distinguish one trisyllabic metre from another. Swinburne, the past master of trisyllabic metres, often passes with great freedom from anapaestic to dactylic lines within the same stanza.

Anapaestic Metres

Pure Anapaestic

Anapaestic metre is used only in short poems and often conveys a sense of speed and urgency. The chief variation is the omission of one or two of the unstressed syllables at the beginning of a line. Some of the best known examples of anapaestic verse are Byron's *Scenarchib Flecker's 'The War Song of the Saracens'* and Lewis Carroll's parodies. 'Tis the voice of the lobster and 'You are old Father William' from *Alice in Wonderland*.

The Limerick

The limerick may be defined as a single anapaestic stanza having the first two lines of three feet, the next two lines of two feet and a concluding line of three feet with the rhyme scheme AABBA.

The origin of the limerick is uncertain but it became popular after the appearance in 1846 of Edward Lear's *Book of Nonsense*. Lear's limericks differ from the contemporary type in that his final line is normally a repetition adding nothing to the sense and repeating one of the previous rhyme words.

Most of our modern limericks are passed on by word of mouth but some that concisely express some intellectual attitudes have appeared in print as the following on Determinism —

There wás a yóung mán who sáid Dámn!
It áppeárs to mé nów thát I ám
Just á béíng thát móves
In prédestínáte gróoves
Nót á táxi or búsbút á tráím

Dactylic Metres

Pure Dactylic

Like pure trochaic metre, pure dactylic metre has a feminine ending to the line which makes rhyming difficult and does not satisfy the English ear. Very few serious poems keep consistently to a pure dactylic verse and Robert Graves in *The Wilderness* is most unusual in this respect e g

Christ of Hís géntleness
Thírstíng and húngéríng
Wálked in the wílderness

Modified Dactylic Metre

Normally dactylic metre is modified in that a catalectic line is frequently used where the final foot is shortened to a trochee or a stressed monosyllable as in Hood's *Bridge of Sighs* [OBEV 662] the most remarkable dactylic poem in the language e g

Óne móre unfórtúnáte
Wéáry of bréáth
Ráshly ímpórtúnáte,
Góne to her déáth.

Shakespeare also uses the catalectic line in the refrain to *Where the bee sucks* [OBEV 140]—

Mérrily mérrily sháll I líve nów
Under the blóssóm thát hángs on the bóugh

It is interesting to note how the catalectic dactylic line of the refrain is matched by the catalectic trochaic line of the verse

Amphibrach Metres

Pure Amphibrach Metre

The amphibrach metre is extremely rare in English although it occurs occasionally in a few lines or a refrain like that to *Blow, blow, thou Winter Wind* [OBEV 146]. Laurence Binyon's

Bablock Hymne is one of the few poems to use amphibrachs continuously *e g*

Till sunset was dimming
The West with pale flushes
Behind the black rushes
The last light was dimming

Modified Amphibrach Metre

The pure amphibrach line can be used alternating with a catalectic line shown of its last syllable as in Goldsmith's drinking song in *She Stoops to Conquer* Act I Scene 2 *e g*

Let school masters puzzle their brain
With grammar and nonsense and learning

Choriambic Metre

There are few poems in pure choriambic metre. Ruskin's quatrains *Trust Thou thy Love* [OBLV 753] is one of the few examples *e g*

Trust thou thy Love if she be proud is she not sweet?

Choriambic effects are often obtained incidentally especially in blank verse when the first foot of a line is a trochee

Lionel Johnson frequently achieves the same kind of effect in lyric verses by substituting a choriamb for two iambs as in the poem *By the Statue of King Charles* [OBLV 909] *e g*

Comely and calm he rides
Hard by his own Whitehall

Sprung Rhythm

Sprung rhythm was practised by Gerard Manley Hopkins and his followers

Its distinction lies in the fact that in a foot of verse the first syllable is always stressed and this stressed syllable may be followed by any number of unstressed syllables from none to three or even more as the occasion demands. Hopkins has described sprung rhythm in the Preface to his *Poems*

Quantitative Classical Metres

Since the Renaissance poets such as Spenser, Coleridge and Tennyson have from time to time endeavoured to reproduce in English verse the complicated quantitative metres of Greek and Latin verse. The difficulty if not impossibility of putting the stress on the long vowel in English has for the most part rendered such experiments interesting only to the scholar.

It should always be remembered that the technical names such as iamb and trochee although borrowed from the classics have in English verse a quite different meaning referring never to quantity but always to stress.

Metrical Forms of French Origin

It became fashionable during the last years of the nineteenth century for poets to imitate certain verse forms which had long been practised in France some of them from the time of the troubadours.

Chaucer and Gower had in the fourteenth century used some of these forms. Later English poets had occasionally experimented with some of them and Swinburne, Austin Dobson, Edmund Gosse and others did much to adapt and naturalise them, although their intricate rhyming patterns are very difficult to construct in a language so short of rhymes as English. The most popular were the triolet, villanelle, rondeau, ballade and sestina.

Characteristic of the Anglicised versions are

1. Freedom as regards metre and length of line

2. Complicated and exacting rhyme schemes which permit of no such poetic licence as identical rhyme

3. A refrain line which recurs in certain stereotyped positions without any alteration of sound although there may be significant alteration of meaning. Only the sestina is without a refrain.

Triolet

A triolet is a single stanza of eight short lines. The first line is repeated as the fourth and the first and second appear again as seventh and eighth. Only two rhymes are used the scheme being ABAAABAB.

The triolet was re-introduced into England by Bridges in 1873. Austin Dobson's *A Kiss* is a good example of the form.

Rose kissed me today
Will she kiss me tomorrow?
Let it be as it may
Rose kissed me today
But the pleasure gives way
To a savour of sorrow—
Rose kissed me today
Will she kiss me tomorrow?

See also Dobson's triolet *I intended an Ode* [OBLV 828]

Villanelle

The villanelle has five stanzas each of three lines followed by one stanza of four lines. It has a refrain which consists of the first and third lines of the first stanza. These lines alternately form the last lines of the four middle stanzas and reappear as a concluding couplet to the poem. Only two rhymes are employed throughout. Stanzas one to five rhyme ABA and stanza six ABAA.

Austin Dobson wrote several villanelles including the well known *On a Nankin Plate*. The following of Henley's is both a good example and description of the form.

Villanelle by W. E. Henley

A dainty thing's the Villanelle
Shy musical a jewel in rhyme
It serves its purpose passing well

A double clappered silver bell
That must be made to clink in chime
A dainty thing's the Villanelle

And if you wish to flute a spell
Or ask a meeting neath the lime
It serves its purpose passing well

You must not ask of it the swell
Of organs grandiose and sublime—
A dainty thing's the Villanelle

And filled with sweetness as a shell
Is filled with sound and launched in time
It serves its purpose passing well

Still fair to see and good to smell
As in the quaintness of its prime
A dainty thing's the Villanelle
It serves its purpose passing well

Rondeau

A rondeau is a short and compact verse form. It has thirteen lines usually of eight syllables which use only two rhymes and in addition a refrain usually of four syllables which introduces a third rhyme. This refrain consists of the first half of the opening line and is twice repeated thus giving the rondeau fifteen lines all told. The rondeau is divided into three stanzas with the following rhyme scheme: AABBA AAB + refrain C AABBA + refrain C.

Austin Dobson wrote many rondeaux to this exacting plan including the ingenious *You bid me try and In After Days* [OBLV 830].

A Pondeau by Austin Dobson

You bid me try

You bid me try Blue Eyes to write
A Rondeau What!—forthwith?—to night?
Reflect Some skill I have 'tis true —
But thirteen lines!—and rhymed on two!
Refrain as well Ah hapless plight!

Still there are five lines—ranged right
These Gallic bonds I feared would fright
My easy Muse They did tell you—
You bid me try!

That makes them eight The poets in sight —
Tis all because your eyes are bright!
Now just a pair to end in 'oo' —
When maids command what can't we do
Behold!—the PONDEAU tasteful light
You bid me try!

1876

Rondeau

The rondeau is a variation of the rondeau Swinburne in his *Century of Roundels* wrote a hundred and his pattern is usually followed. It consists of nine full lines plus the refrain (consisting of the opening half of the first line) which is twice repeated giving eleven lines all told. Only two rhymes are used throughout. The rondeau is divided into three stanzas with the following rhyme scheme: ABA + refrain B B A B ABA + refrain B

Swinburne's rondeau called *The Pondeau* is especially interesting

Rondel

The rondel is a form of verse similar to the rondeau. The modern English version consists of fourteen lines all told. Only two rhymes are used and the initial two lines are repeated as lines 7 and 8 and again as lines 13 and 14. The rondel is frequently arranged in three stanzas with a rhyme scheme as follows: ABBA ABAB ABBAAB

The rondel was revived in the nineteenth century by Bridges, Dobson, Gosse, and Henley and Dobson's *Love* comes back to his vacant dwelling is one of the best known

Ballade

There are several kinds of ballade but the most popular modern form consists of three eight-lined stanzas followed by an envoy of four lines. Each of the stanzas and the envoy end with a refrain. The rhymes of the eight-lined stanzas are ABABBCBC and of the envoy BCBC

Austin Dobson wrote several ballades of this kind the best known being *This was the Pompadour's fan* and *And where are the galleons of Spain?*

Chaucer's *Ballade Hynd Absolon* thy glite tresses clere is of an earlier seven-lined type without an envoy

A ballade by Austin Dobson

The Ballad of the Thrush

Across the noisy street
I hear him careless throw
One warning utterance sweet
(This faint at first and low
The full notes closer grow)
Hark! What a torrent gush!
They pour they overflow—
Sing on sing on O Thrush!

What trick, what dream's deceit
Has fooled his fancy so
To scorn of dust and heat?
I prisoned here below
Feel the fresh breezes blow
And see thro' flag and rush
Cool water sliding slow—
Sing on sing on O Thrush!

Sing on What though thou beest
On that dull bar thy foot!
Somewhere the green boughs meet
Beyond the roofs a rove
Somewhere the blue skies show
Somewhere no black walls cru
Poor hearts with horrid woes—
Sing on sing on O Thrush!

Envoy

Bird though they come wel now
The empty cage the hush
Still ere the brief day go
Sing on sing on O Thrush!

1883

The Chant Royal

The chant royal is a longer form of ballade. It has five stanzas of eleven lines and an envoy of five lines

The rhyme scheme is AB ABCDDDEDE and the envoy has rhyme DDEDE

The Sestina

The sestina has six stanzas each of six lines. The end words to the lines of the first stanza are repeated as end words in the other five stanzas but in a different and stereotyped order. The poem concludes with an envoy

The first sestina published in English was in Spenser's *Shepherd's Calendar* (1579). Swinburne wrote many including *I saw my soul at rest upon a day*

The Clerihew

The clerihew is an amusing quatrain so called after its inventor Edmund Clerihew Bentley. It disdains regular metre and depends on the simple rhyme scheme A A B B. The distinctive characteristic of the clerihew is that it is concerned with some eminent person who is named in the first line and then described in a wilfully fanciful way the matter being dictated by the exigencies of the rhyme as in Bentley's clerihew on J. S. Mill

John Stuart Mill

By a mighty effort of will
Overcame his natural bonhomie
And wrote *Principles of Political Economy*

We might invent a clerihew for Pears Cyclopaedia and say

You will find *Pears Cyclopaedia*
A simpler and speedier
Aid in your search for verity
If you do not use it with levity

Free Verse or Vers Libre

It is hardly possible to define anything so vague as Free Verse. It is characterised by a greater intensity of feeling and a more elevated language than is usual in prose and has a rhythm that is different from that of poetry in that it is irregular it has rhythm but not metre

Free Verse is arranged in lines but these lines have an indefinite number of syllables. They have balance but no regularly recurring pattern of stress and no rhyme

The best known writer of Free Verse is Walt Whitman whose *Leaves of Grass* was published in 1855

VI. CONCLUSION

The foregoing account is no more than a description of our traditional verse forms. It in no way implies that verse is written according to rules

We have only to look at Shakespeare's lyrics [OBEV 133-174] to realise how brilliantly free and inventive the poet can be in devising new and delightful patterns of verse—many of them so subtle as to be very difficult to define. All that the students and critics can do is to follow in the poets' wake endeavouring to understand and elucidate the forms that the maker has created

IV FIGURES OF SPEECH

We constantly use figurative language without realising it. When we say that we are browned off, fed up, at the end of our tether, we do not expect to be taken literally. We are in fact employing metaphors.

An understanding of metaphors and other figurative expressions enables us to use our language with greater confidence and effectiveness. It also helps us to understand more fully what others have written. Especially is it valuable when we read a good novel, play, or poem for to the creative writer figurative language is as natural as the air he breathes.

The following guide to our figures of speech is arranged alphabetically for ease of reference.

Alliteration. A kind of repetition. Two or more words in close succession begin with the same letter or sound, usually a consonant. Up to the fourteenth century much English verse was written according to an alliterative principle as in this modernised quotation from *Piers Plowman*:

I had wandered me weary so weary I rested me
On a broad bank by a merry sounding burn.

A strong tendency to alliteration still survives in our poetry. Shakespeare ridicules it in the mechanicals' play in *A Midsummer Night's Dream* (Act V Scene 1) in such lines as—

Whereat with blade with bloody blameful
blade
He bravely broach'd his boiling bloody breast.

Anti-climax. See **Bathos**.

Antithesis. A figure of speech where ideas are so set out that they are in sharp contrast to each other. *e.g.*

Better to reign in Hell than serve in Heaven
Milton
To err is human, to forgive divine
Pope

Apostrophe. A figure of speech where the speaker or writer suddenly breaks off and directly addresses some other person who may be present either in the flesh or only in the imagination. Often it is not a person but a thing, abstraction, or personification that is addressed as in Milton's famous apostrophe, *Hail, holy light* in *Paradise Lost*. Book III line 1. Apostrophe can be used with comic effect. *e.g.*

She turns O guardian angels stop her
From doing anything improper.

(This couplet is also incidentally an example of bathos.)

Assonance. (1) Assonance is correspondence of vowel sounds. For instance in the opening lines of the fairy song in *A Midsummer Night's Dream* (Act II Scene 3) there is a play on only three vowels, and this repetition helps towards the effect of a magic charm. *e.g.*

Philomel with melody sing

In Tennyson's poem *Break, break, break* the repetition of the *o* sound in the second line is an outcry of grief. *e.g.*

On thy cold grey stones O sea

(2) Assonance is sometimes used instead of rhyme especially in early folk poetry. Here there is correspondence of one word with another in the accented vowel and any vowels which follow but not in the consonants. *e.g.* in *King Estmere*, Spain is rhymed with same, and barone with home.

Bathos or Anti climax. A figure of speech that consists of a sudden and ludicrous descent from lofty to trivial things. In *The Rape of the Lock*, Pope wittily used bathos to satirise the frivolity of the woman of fashion who lacks all sense of proper feeling, casts the same screams of horror and shrieks to pitying heaven.

When husbands or when lapdogs breathe their last

The careless writer may fall to bathos which is unintentionally comic in its effect. The word bathos in Greek means depth.

Climax. A figure of speech where ideas are set out in such a way that each rises above its predecessor in fable. In Greek the word climax means a ladder. One of the finest examples is in Shakespeare's *The Tempest* (Act IV Scene 1) when Prospero says

And like the baseless fabric of this vision
The cloud-capp'd towers, the gorgeous palaces,
The solemn temples, the great globe itself
Yea, all which it inherit, shall dissolve.

Epigram. A concise and pointed saying effective by its wit and ingenuity. It often uses antithesis. S. T. Coleridge's definition of this form is in itself an epigram. *e.g.*

What is an epigram? A dwarfish whole
Its body brevity and wit its soul.

Euphemism. A figure of speech where a harsh or distressing expression is replaced by one that is gentler if less accurate. Thus we may call a lie a flight of fancy or a terminological inexactitude. There is a striking instance of euphemism in *Macbeth* (Act I Scene 5) when Lady Macbeth, planning the murder of her guest Duncan, says: He that's coming must be provided for.

Hypallage or Transferred Epithet. A figure of speech where an adjective or adverb is separated from the word to which it belongs grammatically and is transferred to some other word in the sentence, its unusual position giving it a kind of emphasis. The word obsequious is thus transferred in the sentence: A lacquey presented an obsequious cup of coffee.

Hyperbole. A figure of speech where there is a deliberate use of exaggeration for the sake of effect as in the phrase: tons of money. Lady Macbeth uses hyperbole when she says: Here's the smell of blood still! all the perfumes of Arabia will not sweeten this little hand. (Act V Scene 1).

Writers of film trailers frequently indulge in hyperbole.

Innuendo. A figure of speech where something is hinted at or suggested but not openly stated. Dickens uses innuendo to suggest Scrooge's stinginess by saying: Darkness was cheap and Scrooge liked it.

Irony. (1) A figure of speech where the speaker says one thing but intends the opposite to be understood. Shylock uses the word courtesies ironically when he says:

Fair sir, you spit on me on Wednesday last
You spurn'd me such a day, another time
You call'd me dog, and for these courtesies
I'll lend you thus much money.

Merchant of Venice (Act I Scene 3)

The use of irony can clearly be seen in Shakespeare's *Julius Caesar* in Antony's well known speech to the citizens. They gradually realise

that when Antony repeats that Brutus and the rest are honourable men he is speaking ironically and intends the opposite. When they fully perceive this they cry 'They were traitors villains murderers' (Julius Caesar Act III Scene 2)

(2) *Dramatic irony* is the use of words which have a second inner significance that is not realised by some of the actors in a scene. For instance in Sheridan's *School for Scandal* Act IV Scene 3 Sir Peter admires Joseph Surface's useful screen and Surface replies 'Oh yes I find great use in that screen. He and the audience know but Sir Peter does not that at that very moment the screen is concealing Peter's own wife who had rashly visited Joseph.'

It is helpful to remember that in Greek the word *irony* means dissimulation.

Litotes A figure of speech which is really a special kind of understatement (or *Meiosis*). Instead of making a positive statement (e.g. 'This is a difficult task') we might use Litotes and say 'This is no easy task' thus expressing a positive by the negative of its opposite.

Malapropism An amusing inaccuracy in vocabulary. Words that have an accidental similarity in sound may become confused in the speaker's mind and the wrong word may come uppermost. Thus Mrs Malaprop complains that the disobedience of her niece gives her not hysterics but hydrostatics. It is not surprising that Mrs Malaprop of Sheridan's *The Rivals* has given her name to this kind of verbal confusion though many before her time including humble folk in Shakespeare's plays have uttered malapropisms. Bottom in *A Midsummer Night's Dream* says that in the wood they may rear more obscenely when he means obscurely.

Meiosis A figure of speech where a deliberate understatement is made for the sake of effect. English people are especially fond of Meiosis and often use it colloquially. In such an expression as 'He made a very decent contribution' meaning a very generous contribution. The full meaning of what we intend is often conveyed by the tone of voice e.g.

This is *some* war

Metaphor It is helpful to think of the figure of speech metaphor as a condensed simile. In metaphor one thing is not merely compared to another as in simile but is boldly spoken of as if it actually *were* that other. Thus Bacon in the following metaphor does not say books are *like* food but speaks of them as if they actually *were* food e.g. 'Some books are to be tasted others to be swallowed and some few to be chewed and digested.'

Metaphor is usually defined as the transfer of a name or descriptive term to some object to which it is not properly applicable thus making an implicit comparison. Shakespeare uses nautical terms to describe our human situation when Brutus says

There is a tide in the affairs of men which taken at the flood leads on to fortune (Julius Caesar Act IV Scene 3)

In *Mixed Metaphor* two or more inconsistent metaphors are used of the same object as when, speaking of a suspicious someone said 'I smell a rat. I see it in the air but I will nip it in the bud.'

Metonymy A figure of speech where a person or thing is not named directly but by some associated thing. Instead of saying 'The prisoner addressed the magistrate' we might use metonymy and say 'The prisoner addressed the bench.' Similarly a speech from the Lord

Chancellor is sometimes called a speech from the Woolsack.

Onomatopoeia The use of words which imitate or echo the sounds they suggest e.g.

Seas half frozen slushed the deck with slime
Mansfield

Oxymoron A figure of speech where words that are usually contradictory are combined in one expression e.g. 'bitter sweet'

I know this is a joyful trouble to you
Macbeth Act II Scene 3

Paradox A figure of speech where a statement is made that at first sight seems contradictory or absurd e.g.

The rule of the road is a paradox quite
If you keep to the left you are sure to be right
and

The child is father of the man
Wordsworth

Pathetic Fallacy A figure of speech where it is assumed that things of nature have feelings like those of human beings e.g.

And daffodils fill their cups with tears
Millon

In Greek *pathos* means feeling

Personification A figure of speech where some abstraction or some inanimate thing is represented as a person e.g.

Rule Britannia

But look the dawn in russet mantle clad
Walks o'er the dew of yon high eastern hill
Hamlet Act I Scene 1

Personification is really a special kind of metaphor

Pun The use of words so as to convey a double meaning as in Belloc's couplet

When I am dead I hope it may be said
His sins were scarlet but his books were read

In the three puns that follow there is a suggestion of a banking transaction! The Egyptians received a check on the bank of the Red Sea which was crossed by Moses. Puns which were popular in the nineteenth century especially with Lamb and Hood are now out of favour.

Simile A figure of speech which makes a comparison pointing out a similarity between things otherwise unlike. It is usually introduced by *like* or *as* e.g.

Men fear death as children fear to go in
the dark Bacon
His own thought drove him like a goad
Tennyson

Spoonerism An accidental transposition of the sound of two words so called after Rev W. A. Spooner warden of New College Oxford e.g.

You have hissed all my mystery lectures for
You have missed all my history lectures

Synecdoche A figure of speech where the name of a part is used for the whole, or the whole for the part, e.g.

A fleet of a hundred sail
meaning of a hundred ships

Synecdoche is really a special kind of Metonymy

Transferred Epithet See Hypallage

V LITERARY FORMS

Allegory A description or story which has a second and deeper significance below the surface. The characters are really personifications usually representing some vice or virtue. Allegory flourished in the Middle Ages, but the best known allegory in the world is Bunyan's *Pilgrim's Progress* (1678) which has been translated into over a hundred different languages and dialects. On the surface *The Pilgrim's Progress* is the story of a journey in which the hero encounters many difficulties but at last reaches his destination. Its inner meaning is the progress of the Christian soul through life on earth. Spenser's *Faerie Queene* (1590 and 1596) is a more subtle and complex allegory capable of several interpretations: religious, ethical and political. Allegory has been described as extended metaphor. See M39

Autobiography The story of a man's (or woman's) own life written by himself. The autobiography is becoming increasingly popular. Recent excellent examples being Stephen Spender's *World within World*, Richard Church's *Over the Bridge* and Laurence's *Cide with Rosie*.

Ballad. There are two chief types of ballad

1. A light song of an sentimental as was the Victorian ballad or a popular song often of a personal kind praising or attacking some notability

2. A traditional poem passed on by word of mouth. Many of our traditional ballads date from the 15th century. They tell some stirring tale as do the many ballads about Robin Hood. Sometimes they record an actual occurrence like the ballad *The Battle of Otterbourne* which tells of a Border skirmish fought in 1388. Such ballads are enlivened by lively dialogue and they use a special kind of stanza which is described on M33

Ballade. A short highly stylised poem with a strict verse form. See M37

Biography A narrative telling the life story of some actual person usually a well known figure. The most famous biographer of classical times was Plutarch who in the 1st century A.D. wrote his series of parallel *Lives* of twenty three Greeks and twenty three Romans. The English translation of this provided Shakespeare with some of the plots of his plays. Boswell's *Life of Samuel Johnson* (1791) is our best known English biography.

Burlesque The aim of burlesque is to make us laugh by ridiculing the work of some other writer. Sometimes it treats his serious subject in a mocking way. Sometimes it takes the form of an absurd imitation or caricature of his style. Some of our most successful burlesques are dramatic in form, like Sheridan's. *The Critic* produced in 1779. This has a play within a play called *A Tragedy Rehears'd* a brilliant burlesque of the sentimental historical plays so popular in his time. Danny Kaye's film *The King's Jester* is a burlesque of pseudo historical films.

Chant Royal. A poem of a strictly formal kind. French in origin. See M37

Clerihew A single stanza verse form four lines long. See M37

Comedy A play which is happy and amusing in tone but not necessarily light or superficial. A comedy always has a fortunate conclusion. Shakespeare's *Twelfth Night* and Oscar Wilde's *The Importance of being Earnest* are typical examples.

Drama A play in verse or prose where the story is unfolded and the characters represented through the actions and speeches of actors on stage. It is essential to good drama that there should be some kind of dynamic action and some conflict between the characters. In comedy the conflict is usually open and external. As Yeats. *Like It* for instance begins with a quarrel between Orlando and Oliver. But most of the world's finest tragedies reveal also an inner conflict in the soul of man. In *Hamlet* the hero is at odds with many people including his mother the king Ophelia Polonius and Laertes but all these struggles are of secondary significance compared with the conflict in his own mind. Even a play like *Waiting for Godot* which reduces incident and conflict to a minimum must make some concession to the demand of the audience for the dynamic. Drama cannot be static. Occasionally poets have written dramas which they knew were not practicable for the stage. Shelley's lyrical dramas *Prometheus Unbound* and *Hellas* are of this kind. See Section I

Eclogue In classical literature a brief poem usually in the form of a dialogue between shepherds. It was a popular form in the time of the Renaissance. Spenser's *Shepherd's Calendar* (1579) consists of twelve eclogues one for each month of the year.

Elegy A lyric poem of lamentation for the dead. Gray's *Elegy in a Country Churchyard* (1700) is the best known English elegy. It reflects in a general way on the destiny of the humble folk who are buried in a quiet churchyard probably that of Stoke Poges but most elegies mourn the death of only one person. Such are Shelley's *Adonais* (1821) on the death of Keats and Matthew Arnold's *Thyrsis* (1867) commemorating his friend Arthur Hugh Clough. Tennyson's *In Memoriam* (1850) is unusual in that it is not a single elegy but a series of elegant poems inspired by the poet's grief for the death in 1833 of his friend Arthur Hallam.

Epic A very long narrative poem usually consisting of several books. The epic tells of the splendid deeds of some hero of history or legend and is frequently concerned with war. Some of the world's greatest epics are the Greek *Iliad* and *Odyssey* ascribed to Homer the Latin *Aeneid* of Virgil the Hindu *Mahabharata* and Milton's *Paradise Lost* whose hero is God himself. The epic is distinguished by its sustained dignity of style.

Epilogue See Prologue

Essay The word essay derived from the French, means literally an attempt or an endeavour and as a literary term it applies to a short prose composition which attempts to present the author's reflections on any subject he chooses. As a literary form the essay derives from the French *Essais* of Montaigne first translated into English by Florio in 1609. Our first English essayist was Francis Bacon who published between 1597 and 1625 three volumes of his essays brief pithy and objective in character. In course

of time the essay has become more subjective and personal especially in the hands of Lamb Hazlitt and contemporary writers

Extravaganza A composition musical or literary which uses improbable and fantastic elements and incidents. A good example of narrative extravaganza is Thackeray's *Pose and the King* (1855) in which for instance Cruffanuff's husband the footman is because of his rudeness turned into a door knocker. Extravaganzas are frequently dramatic in form and most pantomimes may be regarded as such.

Fable A very brief story designed to teach some lesson or moral. The characters of the story are often animals, birds or insects which converse like human beings. The most famous of all fables are those attributed to Aesop and those of La Fontaine the French writer of the 17th century.

Farce A species of dramatic comedy whose whole aim is to excite laughter. It does not scruple to use improbable characters and incidents and absurd situations. Charley's Aunt is a typical farce.

Lampoon A coarse satire (qv) attacking an individual. Lampoons are usually short. The word itself is derived from a French word meaning drinking song.

Limerick A single stanza verse form 5 lines long and with a formal metre and rhyme scheme. See M35.

Lyric In ancient Greece a lyric was originally a poem meant to be sung to the accompaniment of the lyre, a stringed musical instrument rather like a small harp. Later the word was used for a poem with song like qualities, short, usually divided into verses and expressing the feelings of the poet. The lyric flourished in England in the Elizabethan age as witnessed by the lovely lyrics scattered through Shakespeare's plays. Neglected in the 18th century it became popular again with the Romantic poets of the 19th century. Odes, elegies and sonnets are all species of lyrics.

Mask or Masque A dramatic entertainment performed by amateurs and originating in the court masquerade. The action or plot of the masque is of the slightest and there is little concern with portrayal of character for the masque gives pleasure by means of its verse, music and dancing and its elegant costume and scenery. It was very popular in the 16th and 17th centuries and from 1606 Ben Jonson wrote many court masques for which Inigo Jones designed original costumes and settings. Our best known examples are Shakespeare's masque in Act IV of *The Tempest* and Milton's *Comus*.

Melodrama. There are two meanings of the word melodrama.

1. In the early 19th century a melodrama meant a play usually of a romantic and sensational kind in which songs were inserted and where an orchestra accompanied the action. The musical comedy of today might be regarded as its modern counterpart.

2. Today the word melodrama is used of an inferior kind of play which deliberately excites the emotions by its sensational and violent happenings but which has a happy ending. We should be careful to distinguish melodrama which uses violence for its own sake from serious plays like *Hamlet* or *King Lear* where violent acts are only incidents necessary to a profound interpretation of human conduct.

Memoirs. The word is normally used of a record of events of which the author has some personal experience or special source of information.

Miracle Plays. Medieval verse plays produced from the 11th to 14th to 18th centuries by the town guilds and performed in the market place or other suitable open space. They consisted of a series of dramatized stories from the Bible or Lives of Saints. Each scene would be allotted to one of the guilds which was then responsible for its production on a wheeled stage. As soon as the actors of one guild had completed their scene their stage would be trundled off sometimes to another rendezvous and would itself be succeeded by another stage with its scene until a whole cycle or episodes had been performed. Four great cycles of miracle plays are still extant called after the towns where they were probably performed: York, Coventry, Chester and Wakefield. The Wakefield cycle is often called the Towneley cycle. The plays have not only a strong religious sense but a lively comic spirit. The Towneley cycle has some especially racy comic scenes. One popular incident shows the noisy quarrel that results when Noah's wife refuses to go into the ark.

Mock Heroic. A species of parody (qv) caricaturing some play or poem written in a lofty and high flown style. *The Rehearsal* (1672) by Villiers is typical. It is an absurd imitation ridiculing the artificial and high falutin heroic plays which were then in vogue.

Monody. In Greek literature an ode sung by a single voice like our solo in music. In English literature it signifies a poem of mourning for someone's death. The elegies Lycidas by Milton and Thyrsis by Matthew Arnold were both called monodies by their authors.

Monologue. Originally a scene where one person of the drama spoke alone. Today it usually means a dramatic composition for a single actor such as the well known Lancashire monologues presented by Stanley Holloway. The word is also sometimes used as meaning soliloquy.

Moralities or Morality Plays. Medieval verse plays of an allegorical kind which attempted to teach lessons of virtue to the persons of the drama usually being not real people but personifications. Most Moralities date from the 15th century the best known being *Everyman* which is Dutch in origin. The hero Everyman is summoned by Death and vainly appeals for help to his friends, Fellowship, Kindred, Goods, Knowledge, Beauty and Strength but all fail him. Only his own Good Deeds will consent to accompany him on his last journey.

Mysteries or Mystery Plays. Some modern writers use the term Mystery play instead of Miracle play (qv). It is really an alternative title. One critic tried to distinguish between Mystery plays, as concerned with stories from the Gospels, and Miracle plays, as concerned with the lives and deeds of Saints, but this distinction is not usually followed.

Novel. A lengthy prose fiction in narrative form telling a realistic story of people and their doings. Its chief interest is in character and incident. The first English novelist was Samuel Richardson, whose novels, especially *Pamela* (1740-41) and *Clarissa Harlowe* (1747-48) had a European reputation. In the present century writers like James Joyce and Virginia Woolf have written what have been called novels of the stream of consciousness where the interest lies not so much in the incidents as in the mind's response to events and reflections. See M4-41.

Ode. In classical literature an ode was a poem to be sung. In English literature it signifies a

lyric poem usually in rhyme and is seldom longer than 150 lines. It is usually in the form of an address, and lofty in its feeling and style. The ode was popular with the romantic poets. Some of our best known are Shelley's *Ode to the West Wind* and Keats' *Ode to a Nightingale*. *Ode to a Grecian Urn* and *To Autumn* all of them published in 1820.

Parable A parable is an arresting simile or metaphor from nature or common life which may be elaborated into a life like story. It presents a situation which at a certain point implies some correspondence with ethical or religious principle. See C. H. Dodd's *The Parables of the Kingdom*.

Parody A literary caricature which mimics the themes and style of some other author in such a way as to make his faults seem absurd and laughable. J. C. Squire's *Trials of the Trade* is an amusing collection of his skilful parodies of such writers as Byron, Wordsworth and Massfield.

Pastoral A pastoral poem romance or play is one in which the life of shepherds or of simple rustic folk is portrayed in an idealised way. Originating in Greek literature the pastoral was revived at the time of the Renaissance. Spenser's *Shepherd's Calendar* consists of twelve pastoral eclogues. Shakespeare's *As You Like It* is a pastoral play. Milton's *Lycidas* is a pastoral elegy and his *Comus* a pastoral masque. There is usually in the pastoral a deeper meaning below the surface. A critic has said: "The shepherd's cloak was the acknowledged disguise of the lover the poet, the courtier the pastor of souls the critic of contemporary life." In the pastoral form the charm of a simple setting and deeper significance are combined.

Prologue and Epilogue Generally speaking a prologue means a foreword, or preface and an epilogue an appendix to a literary work but the terms are often used more specifically when referring to a play. Here the prologue is a short speech in verse or prose spoken to the audience by one of the actors before the play begins the epilogue a similar speech after its conclusion. The prologue endeavours to put the audience into a receptive state of mind, the epilogue to ask for a kind reception to the play. Shakespeare's *Romeo and Juliet* has a prologue his *As You Like It* an epilogue spoken by Rosalind who says, "Good plays prove the better by the help of a good epilogue." In the 18th century it was customary for a leading actor to speak the prologue and for a leading actress to make a plea for the play in the epilogue.

Romance The romance of the early Middle Ages was a fictitious tale in verse telling the adventures of some hero of chivalry the interest being in the incidents sometimes of a supernatural kind rather than in character. The most famous of these early romances is the French *Chanson de Roland* of the early 12th century. In the later Middle Ages a romance might be written in prose. In the 16th and 17th centuries a romance meant a tale in either prose or verse in which the scenes and incidents were remote from those of real life. Sir Philip Sidney's *Arcadia* (1590) written to entertain his sister is of this type. Today the word romance is rather vaguely used of a tale of somewhat improbable events. Sir Henry Rider Haggard wrote several such romances including *King Solomon's Mines* (1886) and *She* (1887).

Rondeau A poem of a strictly formal kind French in origin. See M35.

Rondel A poem similar in form to the rondeau. See M37.

Roundel A variation of the Rondeau. See M37.

Saga The word saga which is of Norse origin and means story is applied to the medieval prose narratives of Iceland and Norway especially those concerned with the traditions of Icelandic families and Norwegian kings. William Morris in his *Earthly Paradise* gives in *The Lovers of Gudrun* a version of the Icelandic *Laxdæla Saga*.

Satire A work in either verse or prose attacking folly and vice. Pope's *Dunciad* in verse published between 1728 and 1743 ridicules contemporary authors and literary follies in a massive attack on dullness and literary hacks. Swift's *Gulliver's Travels* (1726) which on the surface is a series of prose tales of travel to imaginary countries is actually a comprehensive satire. It begins in the first book on Lilliput with incisive ridicule of the squabbles between English political parties and religious sects and culminates in the final book on the Houyhnhnms in a devastating attack on all that is bestial in human nature. Samuel Butler's *Erewhon* (an anagram of Nowhere) published in 1872 also uses a prose travel tale in his satirical exposure of Victorian convention and hypocrisy. Although not precisely satires many of Shaw's plays are satirical in spirit. *Arms and the Man* may be considered in one of its aspects as a satire on war.

Sestina A poem of a strictly formal kind French in origin. See M37.

Skit A light satire often in the form of parody.

Soliloquy In a soliloquy a man talks to himself or utters his thoughts aloud regardless of the presence of others who may hear him. The word is usually applied to such utterances by a character in a play. The most famous soliloquies in literature are those of Hamlet.

Sonnet A lyric poem of fourteen lines with an intricate rhyme scheme. See M34.

Squib A brief sharp satire (qv) attacking an individual.

Threnody A term from the Greek seldom used today. It means a song of mourning especially a lament for the dead.

Tragedy A play or other literary work which is preoccupied with the serious and unhappy aspects of life. It is sombre in tone and ends with misfortune. Shakespeare's *Macbeth* and Ibsen's *Ghosts* are typical tragedies.

Tragi-Comedy The word is used in two different ways.

(a) It may denote a play (or very occasionally a story) which combines both tragic and comic elements. Chekhov's *The Cherry Orchard* is a tragi-comedy of this type.

(b) It may also mean a play which is for the most part sombre in theme and tone but which has a happy conclusion like Shakespeare's *The Winter's Tale*.

Trilogy In Greek literature a series of three tragedies like Aeschylus' trilogy the *Oresteia* written when he was nearly seventy in the 5th century B.C. In modern times the word trilogy is applied to any sequence of three literary works which are related to each other in subject and theme.

Triplet A single stanza verse form eight lines long and with a very formal pattern. French in origin. See M33.

Villanelle A poem of a strictly formal kind French in origin. See M36.

VI LANGUAGES

The number of known living languages exceeds 3 000 the great majority of which can be ascribed to about 2 dozen main language families. More than half the world's population of 3 632 000 000 however can be reached by as few as 13 languages.

Languages are related in a distinct group if their ancestry can either be traced back to the same mother tongue or be inferred to derive from an assumed parent language (through comparative linguistic methods historical records etc.). The term 'family' is used for the largest possible such grouping. Contrary to common belief related languages need not be alike phonetically or grammatically nor need speakers of related languages have racial or cultural characteristics in common.

The scientific study of the structure and mechanics of language in general is the domain of *general linguistics*; various branches of which connect with other sciences such as for example communication theory. *Comparative linguistics* denotes the study of the history and relationships of individual languages and language groups and has connections therefore with social studies such as ethnology and historical geography. Modern linguistic study has developed from the study of comparative philology which dates from the end of the 18th cent. It achieved greater scientific objectivity and exactitude in the last decades of the 19th cent. since when the term *philology* has reverted to its original significance denoting the study chiefly of written texts its connections lie therefore rather with literary history and criticism.

Chinese has the greatest number of speakers followed by English Hindi Russian Spanish Japanese German French Italian Malay Bengali and Portuguese.

The oldest recorded language is Sumerian which was spoken by a non-Semitic people who lived in the southern part of ancient Mesopotamia c. 3500 B.C. It was a language conveyed in cuneiform script with a structure and vocabulary unrelated to any other known language. It lost ground to the Akkadian Semitic language and began to die out in Hammurabi's time.

The oldest living language is Chinese with a progressive history of 4 000 years during which it has maintained its identity and given shape to ideas. It is not phonetic i.e. it is not written in groups of letters which represent sounds but each word is represented as a character. Coptic a direct descendant of the ancient Egyptian language has also survived but only as the liturgical language of the Christian Coptic Church (Modern Egyptian is a dialect of Arabic).

In grammar and phonetics the most complex languages are those of the Caucasus together with North American Indian tongues (including Eskimo) while the simplest is said to be Malay. The native languages of Britain besides English are Welsh (with an unbroken literary history since the 6th cent. A.D.) Irish Gaelic (the native tongue of Ireland with a literary history dating back to the 9th cent. A.D.) and Scots Gaelic (which became separate from Irish Gaelic in the 18th cent.

though for literary purposes classical (Irish) Gaelic was employed in Scotland until the 18th cent.). Manx Gaelic is on the point of extinction. Cornish survived until the 18th cent.

A *lingua franca* is a language which acts as a medium of communication over a large multilingual area such as Hindi in India Swahili in southern Africa Malay in the south-western Pacific areas.

A *hybrid* language arises when foreign speakers adopt the basic vocabulary of a second language usually as a commercial medium and adapt it to their own phonetic and grammatical patterns. *Pidgin English* is English-Cantonese *Bachela Mar* is English-Polynesian *Papiamentu* is Negro-Spanish of Curaçao.

An *artificial* language is one that has been deliberately constructed to act as a universal medium of communication the best known is Esperanto.

A *standard* language is one recognised by a state as its national language and used for administration national communications (e.g. radio) and education. It may be one of several languages actually spoken in a particular country or a particular form or dialect in a state where dialectal differences are acute e.g. standard Italian is the Tuscan dialect or a purely written standard e.g. most Arabic-speaking nations despite vernacular dialectal differences employ classical Arabic in books and newspapers. A standard language thus tends to act as a *lingua franca*.

Nine major language families and 11 major individual languages are listed below.

African Languages. Two linguistic pictures of Africa could be drawn one showing the native languages and dialects the other showing a patchwork cover of European languages of colonisation yet neither would be complete without the other for the two groups are everywhere in close contact. Many states recognise two or more official languages both native and colonial in origin.

The principal colonial languages are French English Spanish Portuguese Italian German and Flemish Dutch is of particular interest since it has developed into what is virtually a new language Afrikaans the standard form of which differs in many respects from the European Dutch standard.

The native languages of North Africa and of East Africa down to the equator belong to the Semito-Hamitic family (q.v.). The true Negro African languages number many hundreds with a profusion of dialects. The southern half of the continent is almost exclusively the domain of the Bantu languages. Of these the chief representative is Swahili it boasts a considerable body of

literature has long had currency as a medium of trade and commerce and is fast thriving as a native *lingua franca* over the whole region. It may have as many as 10 million speakers. The Khoi or Bushman-Hottentot languages are spoken in parts of Angola, South West Africa and Botswana. The remaining languages from Senegal to the Sudan are roughly described as Sudanic but they have not been satisfactorily classified and probably include many separate language families. The most significant of these is Hausa, originative in northern Nigeria. It has become like Swahili in the south an extensive *lingua franca* with some 15 million speakers.

Altaic A family of languages extending from Turkey to Mongolia and to northern Siberia, consisting of three main groups: (1) the Turkic languages, the most important member being Turkish with about 26 million speakers; (2) Mongolian; (3) Tungusic languages of northern Asia, chiefly represented by the Manchu literary language.

Arabic The language has a great history—as the evangelising medium of Islam, as the vehicle of a rich imaginative literature and as the repository of science and philosophy during Europe's dark ages. Spoken by some 75 million in inhabitants of countries south and east of the Mediterranean, it remains one of the great languages of the present day. Countries in which it occupies official status include Algeria, Iraq, Israel, Jordan, Kuwait, Lebanon, Libya, Morocco, Saudi Arabia, Syria and the United Arab Republic. See also Semito-Hamitic.

Austro Asiatic Family of languages in southern Asia. They include (1) the Mon-Khmer languages, chief representative, Cambodian or Khmer; and (2) the Munda or Kolarian languages of Bihar and Orissa in north-east India. Some linguists ascribe to this group the Annamese and Muong languages of Vietnam.

Chinese As the national language of China, estimated 710 million inhabitants, Chinese is spoken by over twice the number who speak English, the second most widely spoken language in the world. Unlike India, China is not divided linguistically except in the south-eastern maritime provinces where several differing and mutually unintelligible dialects are found including Cantonese, Wu, Min and Hakka. In most of the rest of the country the language known in the West as Mandarin is spoken.

Mandarin as spoken in Peking is now the standard form of Chinese. The national language is called *pu tung hua* (common speech). Mandarin is also the official standard of Taiwan, although the local dialect is Amoy, a variety of Min. The majority of the Chinese people who have settled in the United Kingdom speak Cantonese.

The traditional Chinese script is ideographic, i.e. each character represents the meaning of a word, not its pronunciation, so that speakers of other widely divergent dialects have always been able to follow the written language. The Chinese Government have recently introduced a system of romanisation, a language reform which will facilitate writing and printing through the replacement of the 4,000 essential characters by the relatively few

letters of the Roman alphabet. Chinese has an attested history of over 4,000 years. See also Sinitic.

Dravidian Family of languages found in southern India. Chief representatives: Telugu (spoken by some 35 million in Andhra Pradesh), Tamil (over 30 million in Madras and eastern Ceylon), Canarese or Kannada (10 million in Mysore) and Malayalam (15 million in Kerala). These are the only four Dravidian languages officially recognised in the Indian Union (see Indian languages). They are written in native alphabets which while ultimately related to the Devanagari script are so modified as to appear totally different. Tamil and Canarese are well established literary languages.

English The English language belongs to the Germanic branch of the great Indo-European family of languages. Its closest relatives are Frisian and Dutch. It originated in the various Saxon dialects carried across by invaders during the 4th and 5th cent. A.D. Old English as it is now known was essentially a spoken language but with the rise of Christianity and the influence of Latin writers it emerged as a literary language. Other influence came from Scandinavian sources (Viking invasions) and French (Norman conquest). Modern English dates from the emergence of Mercian as the dominant dialect during the 14th century. As the major language through former colonisation of countries in all five continents and as a world-wide cultural, scientific and commercial medium, English may have up to 300 million speakers.

French The official language of France, 48 million inhabitants. It is also one of the two official languages of Belgium (spoken mainly in Brussels and the south by about 4 million) and one of the three official languages of Switzerland (with over 1 million speakers in the western cantons (Geneva, Neuchâtel, Fribourg, Valais, Vaud)). With French-speaking peoples in many parts of the world in Canada (Quebec and Ontario) and in countries belonging to the French Community, it may have a total of 80 million speakers. Its derivation from Latin classes it as a Romance language and it is thus related to Portuguese, Spanish, Italian and Rumanian.

German The language spoken by over 75 million people in East and West Germany by 7 million in Austria and as an official language of Switzerland by nearly 4 million in 19 of the 25 cantons. In addition there are German-speaking peoples in Hungary, Czechoslovakia, Poland and other smaller areas of Europe and in former colonial regions (in Africa and some of the Pacific islands) bringing the total to between 95 and 100 million. The standard High German is distinct from the Low German or *Plattdeutsch* colloquial dialects spoken in the lowlands of northern Germany. German and English are the chief representatives of the Germanic group of languages which also include Dutch and the Scandinavian languages.

Hindi The official language of India, as laid down in the 1960 Constitution. English also continued as the official language until 1965 and under the Official Language Act 1963 may still be used in addition to Hindi. Technically Hindi

denotes a group of dialects of which Hindustani is the principal member. It is written in the Devanagari script but has a variant Urdu written in Arabic script and considerably influenced by Arabic and Persian vocabulary. There are close on 170 million speakers of Hindi/Urdu. The necessity of establishing an official medium was emphasised by the fact that according to the 1961 census the number of languages and dialect spoken in India amounted to 1692. Hindi is an Indo-Aryan language of the Indo-European family related to Persian and more distantly to the majority of European languages. It is a modern continuation of Sanskrit, the literary language of the Vedic scriptures.

Urdu and Bengali are the two state languages of Pakistan. English continues to be the official language until 1970.

Indian Languages. See Hindi, Indo-European, Davidian, Austro-Asiatic.

Indo-European. Most of the languages of Europe and of a large part of southwestern Asia belong to the Indo-European family. The notable exceptions are Hungarian, Basque, Finnish, Lappish, Turkish and the Caucasian languages. The major branches and languages are Germanic (English, German, Dutch, Flemish, Danish, Swedish, Norwegian, Icelandic), Romance (French, Portuguese, Spanish, Italian, Rumanian—all derived from Latin), Celtic (Gaelic, Welsh, Breton), Slavonic (Russian, Polish, Czech, Serbo-Croat, Bulgarian), Baltic (Lithuanian, Latvian), Greek, Albanian, Armenian, Iranian (Persian, Afghan), and Indo-Aryan (Hindi, Rajasthani, Punjabi, Bengali).

Italian. The official language of Italy's 50 million people and spoken by about half a million in the Ticino canton of Switzerland. With emigrant speakers exceeding 10 million and as a language of former colonisation in Africa (principally in Libya and Ethiopia) the language is probably spoken by as many as 65 million. Italian is the most direct descendant of Latin and is thus related to French and Spanish.

Japanese. The language spoken by Japan's 95 million people and by some speakers in Korea and Hawaii. Known from the 6th cent. A.D., it has been considerably influenced throughout its history by Chinese both in speech and script. Nevertheless it differs markedly in structure and vocabulary from its neighbour and is more likely to be related to Korean although such a relationship has not been proved.

Malayo-Polynesian. Family of languages native to the southwestern Pacific area, with the following groups: Indonesian (including Malay, Javanese, Tagalog and Malagasy totalling over 120 million speakers), Melanesian (which includes Austronesian and Micronesian languages with just over 1 million speakers) and Polynesian (including Tahitian, Hawaiian, Maori totalling less than half a million). Malay with over 65 million speakers is the official language of Indonesia, and is widespread as a *lingua franca* throughout the eastern archipelago. In Indonesia it is called *Bahasa Indonesia*.

Palaeo-Siberian. Family of languages now considerably on the decline spoken in north-eastern Siberia and including Chukchee, Korvaks and Gilyaks. Some of the southern Sakhalin may belong to this group which shows some similarities to native languages of North America.

Russian. The major language of the U.S.S.R. is the mother tongue of over 80 per cent of the R.S.F.S.R.'s 125 million inhabitants. It is the official language throughout the Soviet Union and as such is extensively propagated at all levels of education. Although the native languages of most minority groups are also legally recognised, discounting Byelorussian and Ukrainian, which are distinct languages, speakers of Russian number at least 100 million. Russian proper may be said to date from the 11th cent. The standard is Muscovite and the language is written in Cyrillic script.

Semitic-Hamitic. Family of languages chiefly represented by Arabic. Hamitic includes the Berber languages of desert nomads of northern Africa and the Cushitic tongues of coastal Ethiopia and Somalia (the ancient Egyptian language was also a member of this group). The Semitic languages include Arabic (q.t.), Hebrew (official language of Israel and widely used by Jews all over the world) and Amharic (the official language of Ethiopia, spoken by some 5 million). Aramaic, the language spoken by Christ, is still spoken in parts of West Syria.

Akkadian. One of the oldest recorded languages and current throughout the Babylonian Empire was spoken by the Semitic people who came to Mesopotamia c. 2500 B.C. from the Arabian peninsula. They took over the cuneiform script of the non-Semitic Sumerians, although the two languages had no affinities. Akkadian was gradually replaced by the Aramaic language and alphabet.

Most of the Semitic languages have proved important languages of civilisation during their history and have a rich literature.

Sinitic. Family of languages of southeastern Asia. The main languages and groups are Chinese (q.v.), Tibetan, Burmese and Thai. The last named includes Siamese and Laotian. These and other languages of Thailand are very similar to one another, but the official language is Lao (Laotian). The Annamese language of Vietnam may also belong to the Thai group.

Spanish. The official language of Spain, Mexico and most of the Central American states (except Brazil, Guyana, Surinam, French Guiana) as well as of the Greater Antilles and widespread as a former colonial medium and an important language of trade with a total of at least 115 million speakers. Modern Spanish may be said to date from the 16th cent. It is very closely related to Portuguese (Portugal, Brazil, and colonial territories).

Uralian. Family of languages including Finnish (4 million in addition to 90 000 speakers of Finnish in the Soviet Union), Hungarian (over 10 million), Lappish (30 000, mainly nomadic) and Samoyedic languages of the northern coastal regions of the U.S.S.R.

VII FOREIGN PHRASES

Fr French Gr Greek Ger German It Italian L Latin Sp Spanish

- à bas (Fr) down down with
a extra (L) from without
ab initio (L) from the cradle
ab initio (L) from the beginning
a supra (L) from within
a bon chat bon rat (Fr) to a good cat a good rat
 well attacked and defended tit for tat a Rowland for an Oliver
à bon marche (Fr) cheap a good bargain
a bras ouverts (Fr) with open arms
abscei reo (L) the accused being absent
absit invidia (L) let there be no ill will envy apart
ab uno disce omnes (L) from one specimen judge of all the rest from a single instance infer the whole
ab uie conditū (L) from the building of the city
 i.e. Rome
a capite ad calcem (L) from head to heel
à chaque saint sa chandelle (Fr) to each saint his candle honour where honour is due
à cheval (Fr) on horseback
à compte (Fr) on account in part payment
a corps perdu (Fr) with might and main
a couvert (Fr) under cover protected sheltered
ad astra (L) to the stars
ad calendas Graecis (L) at the Creek calends
 i.e. never as the Greeks had no calends in their mode of reckoning
à demi (Fr) by halves half way
a Deo et rege (L) from God and the king
ad hoc (L) arranged for this purpose special
ad hominem (L) to the man to an individual's interests or passions personal
adhuc sub iudice lis est (L) the case has not yet been decided
a die (L) from that day
ad infinitum (L) to infinity
ad interim (L) in the meantime
ad libitum (L) at pleasure
ad modum (L) after the manner of
ad nauseam (L) to disgust or satiety
ad referendum (L) for further consideration
ad rem (L) to the purpose to the point
ad valorem (L) according to the value
affaire d'amour (Fr) a love affair
affaire d'honneur (Fr) an affair of honour a duel
affaire de cœur (Fr) an affair of the heart
a fortiori (L) with stronger reason
à gauche (Fr) to the left
à genoux (Fr) on the knees
à haute voix (Fr) aloud
à huis clos (Fr) with closed doors secretly
à la belle étoile (Fr) under the stars in the open air
à la bonne heure (Fr) well timed all right very well as you please
à l'abri (Fr) under shelter
à la mode (Fr) according to the custom or fashion
à la lartufe (Fr) like lartuffe the hero of a celebrated comedy by Molière hypocritically
al fresco (It) in the open air out of doors
al più (It) at most
alter ego (L) another self
à merveille (Fr) to a wonder marvellously
amor patriæ (L) love of country
amori proprio (Fr) self love vanity
ancien régime (Fr) the ancient or former order of things
anguis in herba (L) a snake in the grass
anno Christi (L) in the year of Christ
anno Domini (L) in the year of our Lord
annus mundi (L) in the year of the world
annus mirabilis (L) year of wonders wonderful year
anie bellum (L) before the war
ante lucem (L) before light
ante meridiem (L) before noon
à outrance (Fr) to the utmost to extremities without sparing
à pied (Fr) on foot
à point (Fr) to a point just in time exactly right
a posse ad esse (L) from possibility to reality
aristot meivon (Gr) the middle course is the best the golden mean.
arrière pensée (Fr) hidden thought mental reservation
au courant (Fr) fully acquainted with
audi alteram partem (L) hear the other side
« j'ai (Fr) well acquainted with expert
au fond (Fr) at bottom
auf Wiedersehen (Ger) till we meet again
au pis aller (Fr) at the worst
au retour (Fr) adieu till we meet again
aut vincea aut mori (L) either to conquer or to die death or victory
a verbis ad verbera (L) from words to blows
a vinculo matrimonii (L) from the bond of matrimony
a colonis (Fr) at pleasure
a vostra salute (It) } to your health
a votre santé (Fr) }
a vuestra salud (Sp) }
bas bleu (Fr) a blue stocking a literary woman
beau monde (Fr) the world of fashion
beaux esprits (Fr) men of wit gay spirits
beaux yeux (Fr) fine eyes good looks
ben trovato (It) well or cleverly invented
bête noire (Fr) a black beast, a bugbear
bon gré mal gré (Fr) with good or ill grace willing or unwilling
bonhomme (Fr) good nature artlessness
bonne bouche (Fr) a delicate or tasty morsel
bon vivant (Fr) a good liver a gourmand
brutum fulmen (L) a harmless thunderbolt
canaille (Fr) rabble
candida Pax (L) white robed Peace
casus belli (L) that which causes or justifies war
causa sine qua non (L) an indispensable cause or condition
caveat emptor (L) let the buyer beware (or look after his own interest)
cela va sans dire (Fr) that goes without saying needless to say
ceteris paribus (L) other things being equal
chacun son goût (Fr) every one to his taste
cogito ergo sum (L) I think therefore I exist
comme il faut (Fr) as it should be
commos mentis (L) sound of mind, quite sane
compte rendu (Fr) an account rendered a report or statement drawn up
conditio sine qua non (L) a necessary condition
conseil de famille (Fr) a family consultation
consensus facit legem (L) consent makes the law
consilio et animis (L) by wisdom and courage
consilio et prudentia (L) by wisdom and prudence
constancia et virtute (L) by constancy and virtue
contra bonos mores (L) against good manners
contretemps (Fr) an unlucky accident a lurch
cordeon bleu (Fr) blue ribbon a cook of the highest class
cordón sanitaire (Fr) a line of guards to prevent the spreading of contagion or pestilence
corpus delicti (L) the body or substance of a crime or offence
corrigenda (L) things to be corrected
coup de grâce (Fr) a finishing stroke
coup d'état (Fr) a sudden decisive blow in politics a stroke of policy
coup de soleil (Fr) sunstroke
credat Judæus Apella (L) let Apella the superstitious Jew believe it (I won't) tell that to the marines
cucullus non facit monachum (L) the cowl does not make the friar
cui bono? (L) For whose advantage is it? to what end?
culpam poena premit comes (L) punishment follows hard upon crime

GENERAL COMPENDIUM

A collection of useful tables and data on a variety of unrelated subjects, including silver and china marks, SI units, weights and measures, sunrise and sunset tables, and foreign currencies in relation to the £

TABLE OF CONTENTS

Bank and Public Holidays	10
Bound Book Sizes	8
British Prime Ministers	5
China Marks	15-20
Country Code	10
English Monarchs	3-4
Exchange Rates	9
Foreign Currencies	9
Greek Alphabet	9
Moon's Phases	11
Paper Sizes	8
Roman Numerals	9
Scottish Monarchs	4
Seasons	10
SI Units	6-8
Silver Marks	12-14
Sunrise and Sunset Tables	11
Thermometer Comparisons	9
U S Presidents	5
Weights and Measures	6-8
Wind Scale	10

GENERAL COMPENDIUM

ENGLISH MONARCHS

(A D 827-1603)

Monarch	Accession	Died	Age	Reigned
---------	-----------	------	-----	---------

I—BEFORE THE CONQUEST

SAXONS AND DANES

Egbert	827	839	—	12
Ethelwulf	839	858	—	19
Ethelbald	858	860	—	2

(assassinated)					

WEIGHTS AND MEASURES

Many kinds of measure now in use in the United Kingdom are gradually being converted from Imperial units to SI units. SI is short for *Système International d'Unités*, and it is a system of metric units now coming into international use through the agency of such bodies as the General Conference of the International Bureau of Weights and Measures and the International Organisation for Standardisation (ISO) in whose work Britain participates. Information about SI units is available in booklets published by the British Standards Institution, Sales Branch, 101-113 Platonville Road, London N1.

For a transition period of some years Imperial and SI units will be in use simultaneously. Important parts of the two systems are given separately below. A selection of useful conversion factors is on N8.

Unit Symbols Used in the Tables

Unit	Symbol	Unit	Symbol
metre	m	kilogramme	kg
yard	yd	gramme	g
foot	ft	pound	lb
inch	in	ounce	oz
mile	mile	hundredweight	cwt
square metre	m ²	poundal	pdl
square inch	in ²	pound force	lbf
square mile	mile ²	foot pound force	ft lbf
cubic metre	m ³	calorie	cal
cubic inch	in ³	British thermal unit	Btu
litre	l	horsepower	hp
gallon	gal	tonne	t

1 IMPERIAL WEIGHTS AND MEASURES

Length

1 nail	= 2½ in
1 link	= 7.92 in
12 in	= 1 ft
3 ft	= 1 yd
22 yd	= 1 chain
10 chains	= 1 furlong
8 furlongs	= 1 mile = 1760 yd = 5280 ft

Area

144 in ²	= 1 ft ²
9 ft ²	= 1 yd ² = 1296 in ²
484 yd ²	= 1 square chain
1210 yd ²	= 1 rood
4 roods	= 1 acre = 4840 yd ²
640 acres	= 1 mile ²

Volume

1728 in ³	= 1 ft ³
27 ft ³	= 1 yd ³

Capacity

4 gills	= 1 pint
2 pints	= 1 quart
4 quarts	= 1 gallon
2 gallons	= 1 peck
4 pecks	= 1 bushel
8 bushels	= 1 quarter
36 bushels	= 1 chaldron

The gallon as the capacity standard is based upon the pound

$$1 \text{ gal} = 277.274 \text{ in}^3$$

Weight (Avoirdupois)

1 dram	= 27.343 75 grains
16 drams	= 1 oz = 437.5 grains
16 oz	= 1 lb = 7000 grains
14 lb	= 1 stone
28 lb	= 1 quarter
4 quarters	= 1 cwt = 112 lb
20 cwt	= 1 ton = 2240 lb

Troy Weight

1 pennyweight	= 24 grains
480 grains	= 1 ounce

The only unit of troy weight which is legal for use in trade in Britain is the ounce. Troy and weighings of precious metal are made in multiples and decimals of this unit.

The term *carat* is not a unit of weight for precious metals but is used to denote the quality of gold plate etc. and is a figure indicating the number of 24ths of pure gold in the alloy *e.g.* a 9 carat gold ring consists of nine parts of pure gold and fifteen parts of base metals.

Nautical Measures

1 nautical mile	= 6080 ft = 1853 m
1 knot	= 1 nautical mile per hour = 1.151 mile/h

Note—In future the international nautical mile of 1852 m will be used.

Note—The British Pharmaceutical Code and the British National Formulary—the official works of medicinal reference—no longer contain the apothecaries units of measurement since medicine is now measured in metric units. Prescriptions are in 5 millilitre (ml) units: medicine bottles are in six sizes from 50 to 500 ml.

II SI UNITS

There are six base SI Units. They are

Quantity	Name of Unit	Symbol
length	metre	m
mass	kilogramme	kg
time	second	s
electric current	ampere	A
temperature	kelvin	K
luminous intensity	candela	cd

Derived units are normally stated in terms of the base unit. Examples: the SI units of velocity and density are respectively the metre per second (m/s) and the kilogramme per cubic metre (kg/m³). Some important derived units have well established names of their own. They are

Quantity	Name of SI unit	Symbol	Expressed in terms of SI base units or derived units
frequency	hertz	Hz	1 Hz = 1/s
force	newton	N	1 N = 1 kg m/s ²
work, energy, quantity of heat	joule	J	1 J = 1 N m
power	watt	W	1 W = 1 J/s
quantity of electricity	coulomb	C	1 C = 1 A s
electric potential, potential difference, tension, electromotive force	volt	V	1 V = 1 W/A
electric capacitance	farad	F	1 F = 1 A /V
electric resistance	ohm	Ω	1 Ω = 1 V/A
flux of magnetic induction, magnetic flux	weber	Wb	1 Wb = 1 V s
magnetic flux density, magnetic induction	tesla	T	1 T = 1 Wb/m ²
inductance	henry	H	1 H = 1 V s/A
luminous flux	lumen	lm	1 lm = 1 cd sr
illumination	lux	lx	= 1 lx = 1 lm/m ²

There are special prefixes for forming multiples and sub multiples of the SI units. These are

Factor by which the unit is multiplied	Prefix	Symbol
10 ¹²	tera	T
10 ⁹	giga	G
10 ⁶	mega	M
10 ³	kilo	k
10 ²	hecto	h
10	deca	da
10 ⁻¹	deci	d
10 ⁻²	centi	c
10 ⁻³	milli	m
10 ⁻⁶	micro	μ
10 ⁻⁹	nano	n
10 ⁻¹²	pico	p
10 ⁻¹⁵	femto	f
10 ⁻¹⁸	atto	a

Examples one thousandth of a metre is one millimetre (1 mm), one million volts is one megavolt (1 MV). These prefixes are recommended but other multiples and sub multiples will be used when convenient e.g. the centimetre (cm), the cubic decimetre (dm³).

The following is a selection of special points to note

(i) The name litre now means 1 cubic decimetre or 10⁻³m³ and is a measure of volume.

(ii) Days, hours and minutes are still used to measure time though some scientists may prefer to use kiloseconds, etc.

(iii) The SI unit of plane angle is the radian (rad) but degrees, minutes and seconds are still used as well. $1 = \frac{\pi}{180}$ rad, 1 rad = 57.29578 = 57° 17' 44.81"

(iv) A Celsius temperature say 15 degrees is written 15°C. Note that 15°C would mean 15 coulombs. See L21.

(v) The mole (mol) is important in science as a measure of amount of substance and may be adopted as a seventh basic SI unit. 1 mol is the amount of substance of a system which contains as many elementary units as there are carbon atoms in 0.012 kg of ¹²C. The elementary unit must be specified and may be an atom, a molecule, an ion, an electron, etc. or a specified group of such particles. See F21(2).

(vi) The SI unit of area is the square metre (m²) but the hectare (1 ha = 10⁴m²) will be the normal unit for land measure where we have previously used the acre. The are (a) = 10²m².

(vii) The SI unit of pressure is the newton per square metre (N/m²) but in some technical fields, notably meteorology, the unit of pressure is the bar which approximates to normal atmospheric pressure. 1 bar = 10⁵ N/m².

II SELECTED METRIC EQUIVALENTS FOR IMPERIAL UNITS AND MASUPES

Length

1 m	= 2 54 cm	= 0 0254 m
12 m	= 1 ft	= 30 48 cm
1 ft	= 1 yd	= 0 9144 m
1760 yd	= 1 mile	= 1609 344 m

Area

1 in	= 6 4516 × 10 ⁻⁴ m
144 in	= 1 ft ²
9 ft ²	= 1 yd ²
4 840 yd ²	= 1 acre
6 40 acres	= 1 mile

Volume

1 m ³	= 1 358 71 × 10 ⁻³ m ³
1 ft ³	= 0 028 316 8 m ³
1 UK gal	= 0 004 546 092 m ³

Velocity

1 ft/	= 0 3048 m/s
1 mile/h	= 0 447 04 m/s

Capacity

1 pint	= 0 568 l or 10 ⁻³ m ³
2 pints	= 1 quart
4 quarts	= 1 gal
8 gal	= 1 bushel
8 bushels	= 1 quarter

Weight

1 oz	= 28 35 g
16 oz	= 1 lb
14 lb	= 1 st
112 lb	= 1 cwt

20 cwt	= 1 long ton
(2240 lb)	= 1016 kg
2000 lb	= 1 short ton
	= 907 kg

Note — 1 tonne (t) = 1000 kg

Density

1 lb/m ³	= 2 767 99
1 lb/ft ³	= 16 0185 1 g/m ³
1 lb/UK gal	= 99 7764 1 g/m ³

Force

1 pdl	= 0 138 255 N
1 lbf	= 4 448 22 N

Pressure

1 lbf/in	= 6894 76 N/m ²
----------	----------------------------

Energy (work heat)

1 ft pdl	= 0 042 140 1 J
1 ft lbf	= 1 355 82 J
1 cal	= 4 1868 J
1 Btu	= 1055 06 J

Power

1 hp	= 746 700 W
------	-------------

Temperature

1 Rankine degree	= 1 Fahrenheit degree
= 5/9 Kelvin	= 5/9 Celsius degree

(The Rankine scale of absolute temperature was developed from the Fahrenheit scale exactly as the Kelvin scale was developed from the Celsius scale)

Note — Figures printed in bold type are exact. Unit symbols are the same in the singular and the plural and do not carry a full point (as a mark of an abbreviation).

INTERNATIONAL
PAPER SIZES

Trimmed or finished sizes

A Series

(Books and Magazines)

Designation	Size	
	mm	in
A0	841 × 1189	33 11 × 46 81
A1	594 × 841	23 39 × 33 11
A2	420 × 594	16 54 × 23 39
A3	297 × 420	11 69 × 16 54
A4	210 × 297	8 27 × 11 69
A5	148 × 210	5 83 × 8 27
A6	105 × 148	4 13 × 5 83
A7	74 × 105	2 91 × 4 13
A8	52 × 74	2 05 × 2 91
A9	37 × 52	1 46 × 2 05
A10	26 × 37	1 02 × 1 46

Note — The basis of the international series of paper sizes is a rectangle having an area of 1 sq metre the sides of which are in the proportion of 1 : √2 (a geometrical relationship the side and

diagonal of a square being in that proportion). In addition there is a series of B sizes intermediate between any two adjacent sizes of the A series (for posters etc) and of C sizes (for envelopes).

SIZES OF
BOUND BOOKS

Name	Size of untrimmed page	
	in	mm
Foolscap octavo	6½ × 4½	170 × 110
Crown octavo	7½ × 5	190 × 125
Large crown octavo	8 × 5½	205 × 135
Small demy octavo	8½ × 5½	215 × 145
Demy octavo	8½ × 5½	220 × 145
Medium octavo	9 × 5½	230 × 145
Small royal octavo	9½ × 6½	235 × 155
Royal octavo	10 × 6½	255 × 160

Note — The standard for paperbacks is a trimmed page size of 7½ in × 4½ in (180 mm × 110 mm).

To reduce Fahrenheit to Celsius (centigrade) subtract 32 degrees and multiply by 5/9 to reduce Celsius to Fahrenheit multiply by 9/5 and add 32 degrees

An alternative method perhaps easier to remember is to add 40 to the given figure multiply by 9/5 (F to C) or 5/9 (C to F) and subtract 40

BANK AND PUBLIC HOLIDAYS

In addition to Good Friday and Christmas Day there are Bank holidays in most parts of England, Wales and the Channel Islands on Easter Monday in late Spring and late Summer (see below) and on the first weekday after Christmas (Boxing Day). The Channel Islands also observe New Year's Day and Liberation Day May 9. Scotland observes New Year's Day, Good Friday, a late Spring and a late Summer holiday (see below) and Christmas Day. In addition most towns in

Scotland have locally determined holidays in the Spring and Autumn. Northern Ireland observes all the English holidays and in addition has a holiday on St. Patrick's Day 17 March and on 12 July commemorating the Battle of the Boyne (1690). Easter Tuesday is also a customary holiday for industry and trade.

The Queen's birthday (when decreed) is observed in the Customs and certain other Government establishments as a holiday.

1971	Easter Monday	Apr 12	*Late Spring	May 31	*Late Summer	Aug 30
1972		Apr 3		May 29		Aug 28

*Note—In Scotland May 3 Aug 2 (1671) May 1 Aug 7 (1972)

THE SEASONS

Vernal Equinox—Spring begins	Mar 30 12 22	Mar 20 18 13
Summer Solstice—Summer begins	June 21 07 06	June 21 13 01
Autumnal Equinox—Autumn begins	Sept 22 22 13	Sept 23 04 11
Winter solstice—Winter begins	Dec 21 18 10	Dec 22 00 08

(These times are in G M T)

THE COUNTRY CODE

GUARD AGAINST THE RISK OF FIRE Great damage is done every year to crops, plantations, woodlands and heaths. A match or cigarette thrown away or a pipe carelessly knocked out, picnic fires not properly put out or lighted near dry crops can quickly start a blaze.

FASTEN ALL GATES If animals get out of a field they stray. As a result they may do serious damage to crops, suffer injury on the roads or eat food that is harmful.

KEEP DOGS UNDER CONTROL Animals are easily frightened even by small playful dogs. Stillbirths may be the result.

KEEP TO THE PATHS ACROSS FARM LAND Crops are damaged by treading. Flattened crops are difficult to harvest. Grass is a valuable crop.

AVOID DAMAGING FENCES, HEDGES AND WALLS If these are damaged gaps will be caused. Where a man goes an animal may follow.

LEAVE NO LITTER Litter is not just unsightly but often a danger as well. Broken glass and tins may injure animals and harm machinery.

SAFEGUARD WATER SUPPLIES Country men often depend on wells and streams for water or themselves and for their animals.

PROTECT WILD LIFE, PLANTS AND TREES Wild animals should not be disturbed, plants uprooted or trees treated roughly.

GO CAREFULLY ON COUNTRY ROADS If there is no footpath, walkers are generally safer on the right facing oncoming traffic. Care and patience are needed by motorists when passing farm animals.

RESPECT THE LIFE OF THE COUNTRYSIDE Many of the machines and much of the business stock on which the farmer depends for his livelihood have to be kept in the open. Take care not to damage them.

THE BEAUFORT SCALE OF WIND FORCE

Beaufort number	Wind	Effect on land	Speed	
			M p h	Knots
0	Calm	Smoke rises vertically	Less than 1	Less than 1
1	Light air	Direction shown by smoke but not by wind vanes	1-3	1-3
2	Light breeze	Wind felt on face, leaves rustle, wind vanes move	4-7	4-6
3	Gentle breeze	Leaves and twigs in motion, wind extends light flag	8-12	7-10
4	Moderate breeze	Raises dust, loose paper and moves small branches	13-18	11-16
5	Fresh breeze	Small trees in leaf begin to sway	19-24	17-21
6	Strong breeze	Large branches in motion, whistling in telegraph wires, difficulty with umbrellas	25-31	22-27
7	Moderate gale	Whole trees in motion, difficult to walk against wind	32-38	28-33
8	Fresh gale	Twigs break off trees, progress impeded	39-46	34-40
9	Strong gale	Slight structural damage occurs, chimneys pots and slates blown off	47-54	41-47
10	Whole gale	Trees uprooted and considerable structural damage	55-63	48-56
11	Storm	Widespread damage seldom experienced in England	64-75	57-65
12	Hurricane	Winds of this force only encountered in tropical revolving storms	Above 75	Above 65

Many of the marks found on ceramics are merely the marks of painters and workman. Even when identified they are not a sure guide to the place of manufacture as these people would work in many different factories in the course of their careers. The throwers or repairers (the workers who assembled the various parts of figures etc.) in variously used a mark scratched in the body of the ware prior to the biscuit firing. These marks when under the glaze can safely be treated as genuine. A mark which has been ground in after

firing in order to deceive will not have the characteristic burr or raised edge produced when soft clay is scratched.

Painters and gliders would generally use one of the colours in their palette or gilt to mark the wares upon which they worked. This was probably for the benefit of the management as payment was often on a piecework basis.

The marks used on English wares were applied in several different ways—by incising, impressing, painting or by transfer printing under the glaze.

in blue (also in green after 1850). Marking by painting transfer printing or stencilling over the glaze in enamel colours is always liable to be fraudulent as these types of mark can be added at any time after the piece has been made.

From 1842-83 many manufacturers' wares were marked with the 'diamond mark' illustrated above. This was an indication that the design had been registered with the British Patent Office. Ceramics was Class IV indicated in the topmost

section of the mark. This gave copyright protection for three years. After 1883 the mark was written as a number e.g. Rd No 12345.

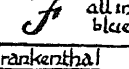

A further indication of late wares is the inclusion of the word 'England' in the mark. This was necessary to comply with the American McKinley Tariff Act of 1891. The full term 'Made in England' is an indication of 20th century manufacture.

It was not until the adoption on Meissen porcelain in 1724 of the K P M and in 1724 of the cross swords (from the arms of Saxony) that marks began to be used at all regularly in Europe. The placing of the mark underneath and the use of blue are clear indications that the Chinese model was being followed. The Meissen practice was then adopted by other German and indeed by most porcelain factories of repute.

Throughout the 18th century the practice was

never regularised and except for a brief period in France from 1766 and two years later in the Dutch town of Delft there was no compulsory marking of wares. The factories of repute proud of their productions added a recognised mark and even used it as at Nymphenburg as part of the decoration. Their imitators left their wares unmarked or employed a mark likely to be mistaken for a more famous one. Weesp and Tournay both adopted a version of the Meissen crossed swords

Factory marks in the Western sense are practically unknown on Chinese porcelain wares while those purporting to record the period of manufacture are so liable to be commemorative or even deliberately fraudulent as to be a frequent cause of dispute among students. Marks of the Ming Chinese Emperors Hsuan Tz, Chêng Hua and Chia Ching are commonly found on wares of the reign of the Ching Emperor K'ang Hsi while the reign name of K'ang Hsi himself rare on the

abundant porcelain of his period is chiefly found on 19th and 20th century wares.

Under the rule of the Ming Emperors (1368-1644) the Sung ideals in pottery were largely rejected in favour of the vogue for fine grained white porcelain heralding the beginning of a new period in Chinese ceramic history with its centre in the town of Ching tse Chên in Kiangsi province where a new Imperial factory was started in 1369 with a prolific output of early Ming blue and white

and fine enamel painted porcelain both for the court and later for general use and export.

Following the fall of the Ming Dynasty in 1644 their declining culture was revived by the Ch'ing Emperor K'ang Hsi (1662-1722) who was a great patron of the arts. The European influence of the French and Netherlandish Jesuits at his court is seen in the Baroque character of the early Ch'ing porcelain.

There was a backward looking tendency during

the reigns of Yung Cheng (1723-35) and Ch'ien Lung (1736-95) when exact copies of the classical Sung wares and the early Ming painted porcelain were made.

The Imperial porcelain of the 19th century was as a rule carefully and weakly correct in following earlier styles and models. The factory was burnt in 1858 by the Tai ping rebels and hardly recovered before the 1911 revolution ended the Dynasty.

MEDICAL MATTERS

Here we give a brief summary of up-to-date medical knowledge, including some recent developments. It must not be allowed to replace your doctor, who should be consulted immediately if you are worried. An index ensures easy reference.

MEDICAL MATTERS

PART I INTRODUCTION

(a) HOW TO USE THE SECTION

Diseases do not exist in watertight compartments but doctors arrange them according either to their cause or the area of the body affected. This plan has been followed here and at the beginning of each part an account of the group of diseases under discussion is given. Unless you know enough already you would be wise to read it.

Here is some advice about your attitude to disease in general and your use of this section in particular.

First of all and obviously no book is a substitute for the doctor and when you are ill you must see him. There are good and bad doctors; competent and incompetent ones just as in any other profession or trade, so choose a doctor you can trust, and then believe what he tells you and carry out his advice. There is no use complaining about the whole medical profession just because you are dissatisfied with your own G.P. If you are you should change him.

Secondly *never* believe what you hear from non-medical sources. Literally millions of people are made miserable every year by taking to heart nonsense told them by others who may well be quite unaware of the harm they do or even have the very best intentions. In any medical matter ask your doctor and ignore your next door neighbour's asked for or unasked for advice. Doctors are sometimes wrong but they are much less likely to be wrong than someone without a medical education. Remember too that the statement that there is no cure for a disease does not necessarily mean that it is deadly and it never means that nothing can be done to make it more tolerable. There is much more to modern doctoring than simply curing the curable.

Thirdly don't try to diagnose your own trouble or decide what treatment you think you should have. This section will have failed completely in its intentions if it puts you in the position of a character described by an English humourist who from a medical dictionary discovered that he had every disease listed in it with the solitary exception of housemaid's knee. Diseases which appear to the layman to have the same symptoms may be vastly different in seriousness; influenza and poliomyelitis for example may in the initial stages appear very similar. So also may stomach ulcer and cancer of the stomach. No human being is infallible but it is most important that you should go to the person who is best fitted to know—your doctor.

Lastly you should not be misled into thinking that you can always tell the seriousness of a disease by the general appearance of the patient. Children in particular may have a high temperature or even be delirious on one day and the next be out of bed and wanting to get back to school. On the other hand many of the most dangerous fevers (as we shall see later) are accompanied by a low temperature and do not appear particularly dramatic in the initial stages. Thus a young woman who may be aware of nothing wrong but lack of energy and getting easily tired may be dangerously ill with tuberculosis of the lungs.

The best rule is to seek medical advice either when you have suddenly become ill with symptoms (80th Ed.)

or (and this is equally important) if you have gradually been feeling less fit over a period of time. Perhaps too it is wise to call your doctor if you have been ill with *anything* for more than three days. You should not call in a specialist before seeing your G.P. as is so often done in America and on the Continent. Specialists are very clever but are naturally prejudiced in favour of their own subject. For example an eye specialist will be predisposed to think of your headache in terms of eyestrain; an ear, nose and throat specialist in terms of sinus trouble; and a psychiatrist in terms of mother-in-law trouble. Therefore you should first have a check from your G.P. who knows a little of all these things and probably a great deal about you and your past history. He will then advise you about a specialist if necessary.

(b) NEW VIEWS ON MEDICINE

(1) Body and Mind. In former times or at least during the nineteenth century the body was regarded as a sort of machine belonging to you in much the same way that you own your watch. You went to your doctor and in effect said: "Now what on earth are you going to do about my stomach?"—and you spoke as if somehow your stomach didn't have anything to do with the *real* you—it was just an awkward thing that happened to be annoying you. But we know now that this is not so—that your body *is* you, that it is a fort fighting against such enemies as poisons, parasites, germs, cancer and injuries. The defences are seriously weakened by not enough of the right kind of food, insufficient sleep or by anxiety. Your anxieties and worries can kill you just as surely as the other agents and can prevent recovery or retard it when you are already ill.

A stomach ulcer therefore is not just something that is happening to you; you are happening to it. Your fears, your jealousies, your hatreds, your inability to get on in life can be (in some cases) just as harmful as germs or poisons—in fact they act by setting free glandular poisons in your blood stream. Scientists have discovered a reaction which they call the stress response, and we now know that stress can ultimately lead to sickness or death without any bodily injury at all. Thus Dr L. J. Saul, a leading American doctor writes: "Emotional stress in which there is no physical damage can produce responses which lead to actual damage and even to death. Rats in the laboratory can be killed through long exposure to fear caused by loud noises or other forms of shock without even being touched."

This stress factor is emphasised not because it is more important than the other enemies of the body or mind (it would be better to say body-mind) but because as we shall see later it does cause serious diseases and secondarily as mentioned already it influences the process of recovery. A person who is afraid or has no hope is less likely to recover from pneumonia or another disease than one who is hopeful, who has peace of mind and confidence.

(2) New Views about Health. A great deal of nonsense has been talked about the healthy life. At one time we were told to take eighteen chews to each bite, to do deep breathing, to take plenty of exercise, to get lots of fresh air, to eat regularly (or to indulge in peculiar diets). But more recently

eminent doctors have cast doubt on most of these fancies. Moderate exercise is necessary to health but athletes who indulge in violent exercise have not always been noted for longevity. Fresh air is pleasant and stimulating but where actual breathing is concerned it is no better than the air in most rooms. Certainly one of the problems of our time is air pollution by smoke and Diesel fumes which are highly dangerous but at present we are considering ordinary fresh air in comparison with the air indoors and in this case the experts say there is little difference so far as health is concerned.

A balanced diet containing correct amounts of the basic food substances is essential but there is no evidence that when or at what intervals you eat makes the slightest difference—unless you are a sufferer from stomach ulcer in which case it is necessary that the intervals between meals should not be too long. The whole business of having meals at fixed intervals is nothing but a social convention and in modern life obviously a matter of convenience. See Diet, P40

Sleep too is a necessity. But different people require vastly different amounts of sleep. Some manage on as little as three hours others seem to believe that they need ten or more. The importance of the dream process is discussed in *Sleeping and Dreaming*, Part III.

In a number of studies of men and women who lived to a ripe old age it was found that the only factors in common between them were that they had a good balanced diet of healthy food that they had contented minds and that they were interested in something which gave them an aim in life. They also came of long lived families—for living a long and healthy life depends partly upon heredity.

So the main rules of health are (1) do not think too much about your health unless it gives you trouble (2) have an interest in life and be prepared to sacrifice a lot for it (nothing useful has ever been done by those who are always taking care and being over cautious) (3) eat a good balanced diet (4) do not worry and have a contented mind.

(3) New Drugs. A great surgeon the first of the moderns was Ambrose Pare' who died in 1590 and one of his best known sayings was 'I apply the dressing but God heals the wound'. He was quite right, for until about forty years ago or even less all the physician could do was to put the patient in as favourable a state as possible to enable his body to cure itself. That is to say there were hardly any specific drugs—drugs that had a direct effect on the disease. There was quinine discovered by the Spaniards in America which was specific for malaria and there were iron (specific for anaemia) and digitalis (specific for certain types of heart disease) but otherwise nothing until the nineteenth century when Paul Ehrlich discovered salvarsan which is specific for syphilis. Ehrlich died in 1914 having conceived the brilliant idea of drugs which he described as 'magic bullets'—i.e. drugs which, like bullets would be aimed at the real cause of the disease. They would, that is to say be specific.

Since then a large number of such drugs have been discovered. For example the antibiotics, such as penicillin, discovered in 1928 by Fleming at St Mary's Hospital, Paddington. Later Florey and Chain in Oxford helped in the war years by the vast resources of the American pharmaceutical industry were able to make penicillin available to the public in sufficient quantities by new techniques of production. Penicillin is practically non-poisonous (although it is possible to become allergic to it, sometimes with serious results). It can kill some germs in a dif-

fusion of one part of penicillin to one hundred million parts of water. It is effective against streptococci the cause of blood poisoning, sepsis in wounds and many other diseases and also against the germs of anthrax, gonorrhoea, meningitis of some types and syphilis—a whole list of plagues which have troubled man for centuries. Blood poisoning whether from wounds or childbirth used to be almost incurable—now the rate of cure is 80-90 per cent. Anthrax and gonorrhoea have an almost 100 per cent rate of cure. In pneumonia the rate is about 90 per cent, and early syphilis can be cured in a week instead of the previous two to three years.

But this was only the beginning. Other antibiotics—streptomycin, tetracycline, erythromycin and many others—are helping to wipe out the terrible scourges of the human race, particularly in the case of streptomycin, tuberculosis. The sulpha group of drugs—sulphadiazine, sulpha dimidine etc.—have also proved a great boon. Then there are the new drugs which have created a revolution in psychiatry—the tranquilisers which relieve anxiety, the drugs which clear up certain types of depression and substances such as chlorpromazine which make it possible to nurse formerly violent patients in the wards of a general hospital. The antihistamine drugs help in many cases of allergy, the anticoagulants prevent further attacks of coronary thrombosis and every year new and powerful aids in the fight against disease are discovered.

Of course these potent new drugs are not without their concomitant risks. The doctor is trained to weigh the harm they can do against the disadvantages of not using them in any particular case. He should not use them for every trivial illness in which their only effect may be to shorten slightly the course of a condition which left alone would recover of itself. Yet in Britain and other technically advanced countries indiscriminate prescribing is common largely because of pressure on the doctor from his patients and the drug firms. The busy mother whose child has a mild sore throat is not going to see the child sweat it out when she knows from past experience that a dose of penicillin can remove the fever and most of the symptoms within twenty-four hours. She is unlikely to listen to the argument that the slower process is capable of increasing the body's resistance to future attacks or that repeated administration of penicillin may create germs which are insensitive to it in a future emergency or worse still produce an allergy to the drug. The thalidomide tragedy of 1962-3 when a new sedative hailed as being both effective and safe (cases were quoted of would-be suicides who had taken up to 100 of the tablets without loss of life) resulted in the birth of children with undeveloped arms and legs to mothers who had used the drug in early pregnancy and prolonged neuritis in some adults has been quoted against the drug industry as an example of cut-throat competition allowing new preparations on the market before they had been exhaustively tested. But the truth is not quite so simple. There can be no reasonable question that the drug industry needs to be under stricter control than its methods of advertising its wares to the doctor are wasteful, unportunate and often in bad taste. That different firms put out what is virtually the same drug under various trade names which merely leads to confusion that the authorities quoted in the advertising of some drugs are often obscure individuals in countries not noted for the high standard of their practice of medicine writing in equally obscure journals and that many drug firms make grossly inflated profits at the expense of our National Health Service. On the other hand it must be remembered that some of the best drug firms have played a major part in medical progress. But they must constantly check their commercial instincts where these conflict (as they sometimes do) with your interests as the patient-consumer. To be fair about thalidomide the fact is that nobody previously had seriously considered the possibility of a drug capable of causing deformity in the unborn child and if they had done it is quite likely that the danger would still have been undiscovered since only certain laboratory

animals respond to thalidomide in a similar way to man. The drug had been exhaustively tested by all ordinary methods before being put on the market and for a number of years during which in Germany it was on sale to the public without prescription because of its apparent safety; millions of people took it without any ill effects either immediately or subsequently. Its terrible side effects were in fact limited to those mothers who used it in early not later pregnancy and in a lesser degree to a small proportion of adults who developed unpleasant but not dangerous symptoms of neuritis.

The taking of any effective drug is always a calculated risk. We have mentioned that the use of penicillin—a drug which is almost completely non-poisonous—may nevertheless cause other germs and fungi to multiply in the body with unpleasant results. This is because penicillin wipes out not only the disease-producing germs it is being used to destroy but the penicillin-sensitive harmless germs which hold the other potentially harmful germs in bay. Thus those who keep on sucking penicillin lozenges for a real or imaginary sore throat may develop a black tongue due to the spread of a fungus normally present but kept under control. Other antibiotics described as wide spectrum because they wipe out an even greater variety of germs than penicillin also kill the organisms responsible for the absorption and possibly the creation of vitamin B in the body thus causing severe vitamin deficiency. Tranquillisers made by various firms vary from the wholly useless to the very useful but both can have unpleasant side effects. One type is prone to lead in a small number of cases to severe depression; others may lower the blood pressure to a degree that causes fainting attacks and serious blood and liver diseases are not unknown if not common. Both tranquillisers and the antihistaminic drugs can cause some people to become extremely drowsy—an obvious danger if one drives a car or works on heights. Even aspirin causes gastric hemorrhages which have sometimes been very severe and even lethal particularly in those with peptic ulceration of the stomach and duodenum. Aspirin, one of the most useful and safest of drugs, should never be taken for an upset stomach or by people with known stomach trouble. Such patients should be warned that about 150 preparations including some hangover remedies widely advertised for upset stomachs contain large quantities of aspirin (acetyl salicylic acid).

None of this should deter the patient from being advised by a doctor he trusts to use whatever drugs are prescribed; it should deter him from putting emotional pressure on his doctor to obtain drugs unwillingly given. It is high time that we gave up the notion that no patient should leave the consulting room without a prescription for some pill or potion for something like 40 per cent of patients simply require advice about the conduct of their life from their diet to their relations with others rather than medicine of any kind. The housing shortage, a bullying boss or a nagging mother in law cannot be removed by a tranquilliser—in fact a tranquilliser by making a man or woman feel better may prevent them from constructively solving problems which exist in the real world. We should all learn to rely as little on drugs as possible, stop taking tranquillisers or pep pills when we are merely worried about something that any normal person would worry about or because we are just fed up, stop using antibiotics (which are badly needed elsewhere in the world) for trivial infections in which they are anyhow useless, stop swallowing vitamin pills which do not relieve tiredness and are merely wasted on this overfed nation, stop buying any patent medicine whatever. Modern drugs are potent and effective; they are a dagger to destroy the enemy of disease. But like a dagger those who play about with them incompetently and unnecessarily are liable to get badly hurt.

(4) **New Methods in Surgery.** Only a few years before the Second World War many surgeons were saying that surgery had reached its extreme limits. It was impossible they believed to

improve on the delicate techniques then reached. But events have proved them wrong. Operations on the heart for example which would have been inconceivable a short time ago are now carried out daily—the heart can be opened and defects of the all important valves made good. Blue Babies or adults with a heart disease which might have led to their death in a few years are now cured by surgery and it is possible during such operations to cut off all the blood from the heart by deflecting it through tubes to an artificial heart outside the body—a machine which pumps the blood round the body whilst the real heart is at rest.

This however will be described in more detail later.

Then there are the new anaesthetics such as Pentothal which are injected into a vein in the arm instead of being breathed in through a mask as were ether and chloroform or ethyl chloride. Pentothal is much safer and avoids the unpleasant after effects of vomiting and nausea which usually followed the old type of anaesthetic. Most curious of all anaesthetists use the poison curare used by South American Indians to poison their arrow heads. Curare produces paralysis but in small doses merely gives the degree of muscle relaxation which is so important to the surgeon when he is operating.

Lastly we might mention the new techniques of plastic surgery. Thus large areas of skin which have been destroyed by severe burns can be replaced by shaving off thin layers from another part of the body. These do not need to cover completely the whole damaged area, small pieces are scattered over the wound and gradually grow together. Corneal disease (the cornea is part of the window of the eye and when it becomes opaque the patient cannot see) is treated by removing the diseased cornea and replacing it by a cornea removed from a dead body or sometimes from an eye which has had to be removed from a live patient for other reasons. There are in fact cornea banks where corneas are kept in refrigeration for future use just as there are blood banks for use in blood transfusions. Other advances in surgery will be described elsewhere in the section.

(5) **New Approaches in Social Medicine.** Medicine has passed through many phases from the time when disease was regarded as a punishment from the gods or a sign of devil possession to the present era when increasingly there is a tendency to look on society as the patient. Indeed one commonly hears doctors and sociologists nowadays talking about the sick society.

The early primitive stage came to an end—at least in one part of the world—when in Greece five centuries before Christ Hippocrates and others began to teach that all diseases were due to natural causes. But after the first ray of hope the outlook began to deteriorate when during the Middle and Dark Ages (that is from the fall of the Roman Empire right up to the fifteenth century) there was a return to the belief in devil possession and supernatural causes.

Eighteenth century medicine in Europe was materialistic regarding the body as a machine. It was founded upon a sort of pseudo science—although of course there were always individual exceptions; physicians such as Sydenham in England who avoiding all theories based their work on observation of the patient. This mechanistic approach persisted right through the nineteenth century but medicine became more and more truly scientific and the century saw the most rapid advances in the field ever known until our own times; the discovery of germs by Pasteur of antiseptics to combat them by Lister of vaccination by Jenner and anaesthetics by the American Wells and the Scot Simpson. The use of the microscope by Virchow who was a German brought great advances in the understanding of disease and Ehrlich another German, conceived as we have already seen, the idea of magic bullets which would attack the germs at the

root of a disease without harming the patient. But one of the greatest of all these great men is perhaps the least known. His name was Edwin Chadwick.

From the earliest period of recorded history human communities had been constantly ravaged by great plagues which swept over their lands year after year killing untold millions. Such plagues are recorded in the Bible and other ancient books but when town life became more and more common as during the Roman Empire and the Middle Ages in Europe the overcrowded conditions were even more favourable to the spread of disease. The Black Death of 1348-9 wiped out almost half the population of Europe. But even in the first quarter of the nineteenth century in London tens of thousands died from typhus typhoid and small pox—and not only these for periodically cholera would be brought into the country by travellers from abroad.

In the face of these terrible visitations the individual physician was helpless. He could not treat each one of the many sick even had he known how and Chadwick's claim to fame rests on the fact that he was the first man to think in terms of social control of diseases by so dealing with their causes that they were prevented from arising at all. In order to wipe out typhoid and cholera he argued we must ensure clean water supplies for these diseases are caused by germs carried in polluted water. In order to attack typhus and plague one must get rid of the lice which carry the germs of typhus and the rat fleas which carry the germs of plague (including of course the rats which in turn carry the fleas).

In the past some attempts had been made to segregate the sick to prevent the spread of disease—for example in the case of leprosy (which strangely enough we now know to be less infectious than most germ borne diseases). But segregating those who are sick with typhoid or cholera is of little use if others are still drinking polluted water just as it is of little use segregating plague cases if rats with their infected fleas are allowed to run at large. So these early attempts met with little success due to lack of understanding of how the infections were passed on.

Chadwick was born in a Lancashire farmhouse where the children were washed every day all over and he ruthlessly drove an obsession with cleanliness into the heads of his countrymen until later in the century it was possible for the German philosopher Treitschke to tell his class in Berlin 'The English think soap is civilisation.'

Although this remark was cynically there is little doubt that soap if it is not civilisation in itself has played a greater part in making civilisation possible than many more elaborate remedies. A population riddled with chronic infectious illness has neither the time nor the energy to apply to the arts or sciences and soap did a great deal to reduce infection.

One of the first Public Health measures was introduced by Chadwick and others when they brought in legislation to purify the water supply of London. Previously the citizens had used water from the Thames (they still do but only after it has been filtered and sterilised at the waterworks!) and from filthy refuse-laden ponds and springs. Later Chadwick helped to found the Poor Law Commission and produced a Report in 1842, the principal suggestions of which were a municipal water supply for all towns scientific drainage both in town and country and an independent health service with large powers for dealing with those who endangered the lives of others by polluting water or causing nuisances. He also proposed a national service for interment of the dead for in those days bodies often remained for days in the overcrowded homes of the poor without burial.

What has the twentieth century contributed to the concept of social health? Well, of course there has been a great deal of legislation along the lines initiated by Chadwick to control disease, and a great many other measures have been introduced concerned with the idea of positive health—not

merely preventing bad health but trying to bring about the highest possible state of good health. Orange juice, milk and good meals for school children have brought about a transformation in child health which has become apparent to the least observant in the last ten or fifteen years. And the National Health Service is in the direct line of descent from early nineteenth century legislation.

But in future years it is probable that the main achievement of the twentieth century in social medicine will prove to be its extension of the term social health to cover every aspect of community life not only in such subjects as bodily health and its control of social means but also such problems as mental illness crime delinquency drug addiction and so on. What we are now asking ourselves is how far are these problems produced by society itself and if this is the case how far can we go in preventing them by social means?

Social medicine takes the view that these problems can never be dealt with solely by moralising and retribution but only by dispassionately analysing causes and dealing with them. In this century we have developed a social conscience. Not always it is true a very well informed social conscience but at least this is a good beginning. There are organisations for dealing scientifically with delinquency for dealing with problem children for spreading knowledge about cancer in order to show people that it can be successfully treated if taken in time. The organisation known as Alcoholics Anonymous has on the whole been more successful in treating alcoholics by social means than have any of the individual medical methods. Mental illness is also treated by group methods which together with the new drugs, have revolutionised the position in mental hospitals. We can well say with John Donne who died in 1631 that no man is an island every man's death diminisheth me for I am involved in mankind. This is the attitude of twentieth century social medicine.

Summary Perhaps we can sum up our progress in the past hundred years more dramatically in terms of hard facts.

One hundred years ago a surgical operation was never undertaken except under the gravest circumstances. There were no anaesthetics and no antiseptics and the operation was carried out by a surgeon in a filthy tail coat stained with the congealed blood of countless operations (indeed the surgeons of that time took pride in the dirty condition of their coat as showing how much experience they had previously had). Germs and the part they play in producing disease were unknown and Paul Ehrlich had not yet been born so there were no magic bullets to attack syphilis or sera for diphtheria and other diseases. The mentally ill were simply locked up with little treatment and subjected to such indignities as the strait jacket and the padded cell, now they are given treatment which becomes more effective each year the padded cell and strait jacket have gone and in the more progressive hospitals even the ward doors are not locked.

Only thirty years ago you would very likely have died if you had developed pneumonia childbed fever after the birth of a child meningitis dysentery typhoid or tuberculosis. With such infections as blood poisoning you would have had practically no chance at all. Today the sulpha drugs and the antibiotics have changed all that. Syphilis and gonorrhoea were lifelong tragedies both to the patient and his family but now they too can be conquered.

The National Health Service has brought the possibility of good treatment equally to all and other bodies—some of them privately run—deal with alcoholism and neurosis with rehabilitation of the mentally and physically ill, with spastics birth control and marriage guidance. It is up to us to see that all these facilities are used to the full by all who need them.

PART II DISEASES ARRANGED ACCORDING EITHER TO THEIR CAUSE OR THE AREA OF THE BODY AFFECTED

THE INFECTIOUS DISEASES INTRODUCTION

INFECTION diseases are those which are caused by an invasion of the body by organisms from outside (the word organism simply means other living things and we are using this word because as will be seen later it is not only what are known as germs which can cause infection). We know too that what is generally typical about this group is (a) that the disease can be passed on from one person to another and (b) that it is usually accompanied by a raised temperature or fever. Now (a) of course is always true because the definition of an infectious disease is one that can be passed on to others but (b) is not always true because a few infections produce little or no temperature and also because it is possible to have a raised temperature (again in only a few cases) without any infection. For example certain types of brain injury tumour or hæmorrhage can produce a raised—or lowered—temperature and so can the injection of some foreign substance such as mull into the muscles. This is known as protein shock and was at one time used in the treatment of certain illnesses. Finally solutions of dead germs such as the anti typhoid vaccine given to protect troops during the War may lead when injected to very high temperatures. But by and large we are entitled to suppose that the patient with a raised temperature is probably suffering from an infection.

Types of Infection.

As we have seen it is not only germs which cause infections—so from now on we shall give germs their proper name of bacteria. Here is a list of the chief offenders which are liable to attack our bodies bacteria spirochaetes viruses fungi amoebæ worms and other parasites. Of these bacteria and viruses are by far the most important but let us look at them all more closely.

Bacteria are tiny living things which can be seen only under a fairly powerful microscope. Some are grouped like bunches of grapes (staphylococci) or in strings or chains (streptococci). They are given these names because staphylos is the Greek word for a bunch of grapes and streptos means a chain. Yet others are comma-shaped (such as the cholera vibrio) or shaped like a drumstick—a rod with a small knob at the end (the tetanus bacillus which causes lockjaw).

It would be a mistake to think that all bacteria are harmful for without some species we could not survive for long. Bacteriologists divide them according to their behaviour in the human body into three groups saprophytic parasitic or pathogenic and symbiotic. The *saprophytic* organisms are the bacteria normally found in the skin mouth and intestines they do us neither harm nor good. The *parasitic* or as they are more usually called, pathogenic (i.e. disease producing) organisms are the harmful ones with which we are naturally more concerned. Lastly there are the *symbiotic* organisms which whilst taking something from the body give something in return. For example cattle would not be able to digest the cellulose of the grass they eat were it not for helpful bacteria in the lower parts of the intestines and there are certain bacteria in the large intestine of man which build up vitamin B2.

Bacteria have two peculiar characteristics each reproduces by splitting into two separate individuals as often as every twenty minutes in favourable circumstances like an open wound. If no bacterium were destroyed, one individual could produce a mass of bacteria larger than the whole world in a matter of a few weeks (since each of the offspring also divides into two which in turn divide again—the progression goes one gives birth to two these two to four the four to eight eight to sixteen sixteen to thirty two and so on—you will see if you work it out that in a short period the figure becomes astronomical). Fortunately many bacteria have accidents so for the present the world is safe! The other curious thing about bacteria is that, barring accidents, they are potentially immortal. Under ideal

conditions in which no bacteria were killed none would die for a bacterium there is no death from old age no corpse except when it is actively destroyed. It simply goes on dividing dividing and subdividing for ever.

How then are bacteria destroyed? Briefly the answer is that most are destroyed by the natural defences of the body of whatever host they are preying on others are destroyed by antiseptics and the new drugs and many are destroyed when they are excreted from the body in the sputum or through the bowels and land in places where they are dried up and cannot survive—although some bacteria in such circumstances can form what are called spores rather like the seed of plants so making it possible for them to survive in a state of suspended animation for months on end until picked up accidentally by another unfortunate host. Finally bacteria in addition to all these possibilities face another danger they may themselves develop disease. This disease is caused by even more minute organisms known as bacteriophages (viruses which affect bacteria) discovered by the French bacteriologist d'Hérelle a good many years ago. Attack by bacteriophage causes whole groups of bacteria (known as colonies) to disintegrate and become harmless.

Although bacteriophage has been used in the treatment of some diseases in human beings this method has now been largely given up since the new drugs are infinitely more effective.

Spirochaetes Spirochaetes like bacteria are minute organisms but differ in being shaped somewhat like a corkscrew and in being able to move (which many bacteria cannot do). Their progress is produced by a sideways wriggling motion. The two main diseases caused by spirochaetes are syphilis and spirochaetal jaundice. Spirochaetal jaundice is carried by rats and is common in those who work in mines. It is now rare in Britain but still occurs in Japan Egypt and Malaya. The infection is passed through the skin where the excreta of infected rats mingle with water on damp ground in the mine where miners kneel. Infection may also occur through eating infected food.

Viruses Unlike bacteria viruses are too small to be seen under an ordinary microscope. They can however be photographed in some cases under an electron microscope which uses a magnetic field instead of a glass lens and a stream of electrons in place of a beam of light. Viruses cause such diseases as typhus measles mumps poliomyelitis smallpox and chickenpox—not to mention such plant and animal diseases as tobacco mosaic disease and foot and mouth disease which often have serious economic consequences. Other virus diseases are psittacosis (an infection of parrots and similar birds which can be transmitted to man) swine fever in pigs influenza in man, and myxomatosis in rabbits. They also cause it is believed the common cold.

The main characteristics of viruses are first that they can only grow in living cells—unlike bacteria which readily grow in the laboratory on plates containing a jelly made from meat broth gelatin milk and other delectables. The scientist therefore must keep them in portions of living tissue kept alive outside the body. Secondly they are so small that they pass through the pores of the finest filter. Thirdly a first attack usually produces immunity for life. Second attacks of the common virus diseases mentioned above are very rare but unfortunately this rule does not apply to influenza or the common cold. Fourthly there is reason to believe that viruses represent an extraordinary intermediate stage between the living and non living they can, for instance, be produced in crystalline form and yet are just as dangerous when thawed out. Lastly the virus diseases have proved for the most part to be little affected by the new antibiotics and other drugs although vaccination in smallpox and the injection of sera from infected patients in other infections may give immunity for longer or shorter periods.

The two great practical problems that doctors face with viruses are (i) many viruses are unknown because of the difficulty of growing them outside the body in suitable tissue culture. They cannot therefore be conveniently identified in specimens from the patient as bacteria can, and (ii) they are unaffected by antibiotics like penicillin. It has been a great step forward to grow viruses artificially in tissue culture in which they are identified indirectly by the effects they have on the cultured cells. But since we do not know exactly how to grow some viruses (like those of infective hepatitis) they have still not been seen.

When we recover from a viral illness like chickenpox we probably do so by producing virus-killing substances inside our own cells. Scientists are currently searching for these substances in case they can be used like penicillin to cure viral disease.

Fungi. Some infections are caused by fungi—that is to say organisms belonging to the same group as moulds, mushrooms, and toadstools. Penicillin and some other antibiotics are produced from moulds, so as in the case of bacteria, some fungi are helpful. They even help to destroy each other as bacteria do. For example actinomycetes which can cause infection of the jaw and other tissues is destroyed by other tissues.

Most fungal infections are trivial and limited to the skin. But although trivial they can be unsightly and uncomfortable. Ringworm of the scalp, dhotie itch—an infection of the groin spread by infected underclothing—and so called athlete's foot—are caused by a fungus.

Amoebae. Amoebae are small single cell organisms the largest of which (a harmless type found in stagnant ponds in Britain and elsewhere) is just visible to the naked eye. It is about the size of the head of a pin. Amoebae move in the species which are capable of moving by pushing forward a part of the cell in the appropriate direction and causing the rest to flow into the advancing portion. Like bacteria, they reproduce by dividing into halves, each of which becomes a new cell.

The main human disease caused by amoebae is amoebic dysentery (not to be confused with bacillary dysentery).

Parasites. These may live on the skin like lice (which can carry typhus) or fleas (carriers of plague) or the parasites of scabies which burrow into the skin, or they may live part of their time in the blood or other tissues like malaria. They often have complicated life cycles involving other hosts (like mosquitoes) at certain stages of development.

Worms. Worms are intestinal parasites but the only common types found in Britain are threadworms, the tiny thread-like worms which cause irritability and itching in the skin of children, less often in adults. Round worms somewhat resembling the ordinary garden earth worm which seldom lead to symptoms, and tape worms which may reach a length of 10 or even 20 ft. Many parasitic worms (like parasites elsewhere) lead a double life—they spend part of their life in the human intestine and the other part in the muscles of another animal. The tape worm, for example, whilst in the human intestine lays eggs which pass out of the body in the excreta, and are then swallowed by pigs, especially in those parts of the world where human excreta are used as manure in the fields. In the pig the eggs form cysts in the muscles—meat infected in this way is known as *measly pork*—and when in turn the meat is eaten by man, the process in the intestine begins all over again.

Less common types from our point of view are the Russian tape worm (which, as befits a Russian, grows to nearly 30 ft.), this type is spread by catflesh or undercooked infected fish. The small, leaf-shaped liver fluke lays eggs which are passed into canals or pools in tropical countries in the urine of infected people, hatch out and enter a water snail, and finally leave the snail in the form of small parasites which pierce the skin of bathers whence they pass to the liver and subsequently the bladder and rectum. This is a serious condition as is also filariasis (another

tropical disease) for which unlike bilharzia—caused by the liver fluke—no cure is known. The tropical disease known as loa loa is caused by a variety of filaria.

How the Infection is Spread

Infection is spread in many ways, some of which have already been mentioned. In the common fevers found in Europe and elsewhere one of the most frequent ways is by *droplet infection*—that is to say by minute drops carrying the germs which are coughed or sneezed into the air by someone already suffering from the disease. Such droplets can be projected into the air for 10 ft. or more and when breathed in by someone within range infection may result. Next commonest mode of spread is perhaps by *infected food water* and the dirty hands of those who prepare food. Cholera, dysentery, food poisoning and typhoid are spread in this way. Spread by *direct contact* is found in the venereal diseases (usually, but not always spread by sexual intercourse with someone who already has the disease) and of course, lice, fleas and other parasites. Including the scabies mite are spread by contact with the infested individual—or sometimes with his clothes or bed linen. Spread through an *intermediary host* whether it be lice, fleas or mosquitoes carrying infection, or the various means adopted by worms has already been described above, so no more need be said. Lastly the infection may result from *bacteria already within the body*, for example the bacillus coli which lives in the large intestine is there harmless, but if it gets into the bladder or the ureters (the tubes leading from kidney to bladder) a quite unpleasant result may follow in the form of cystitis or pyelitis.

How the Body Deals with Infection

The body has many mechanisms of defence against intruders, but suffice it to say here that there are two main ones. First substances known as antibodies and antitoxins are produced in the blood—the antitoxins to neutralise the poisons produced by the invaders, the antibodies to render them helpless for example by causing them to clump together so that they can more easily be dealt with by the second defence mechanism. This second mechanism is provided by the white cells in the blood, some of which (the phagocytes) act like amoebae and swallow up and destroy the germs. Antibodies and antitoxins can be transferred from one individual to another and are used in medicine both to prevent infection and to cure it. This is known as immunisation and can be active or passive. Active immunisation is produced by injecting either a solution of dead bacteria, as in the case of anti-typhoid injections, or by injecting live but weakened strains of the organism as in the case of smallpox vaccination. In both cases the body is stimulated to produce its own immune substances. Passive immunisation is used either for people who have been in recent contact with infection or who are already ill, and in this case the antitoxins produced in another person who has had the illness are injected in the form of serum—the liquid part of the blood without the blood cells. All these natural defences are inefficient in the ill, the underfed, the very young and the very old.

Antiseptics

We have already discussed the other ways in which bacteria are destroyed and now need only make brief mention of antiseptics and antibiotics. The earliest antiseptic was carbolic acid, used by Lister in his operating theatre in the form of a fine spray directed throughout the operation on the wound or sometimes in the form of steam from a kettle containing a solution of carbolic. But carbolic is dangerous and since Lister's time many more useful antiseptics have been discovered. Acridine, thymol and other old favourites have been discarded too. The various forms of carbolic are still used to disinfect drains but to tell the truth the use of antiseptics nowadays is very limited. In surgery the antiseptic method has given way to the aseptic method—instead of fighting sepsis we see to it

that no possibility of sepsis is present before operating all instruments the surgeons and nurses' hands, the skin are sterilised—the instruments by boiling, the dressings by dry heat the hands by soap and water and almost the only antiseptic used is to clean the patient's skin in the area to be operated on.

Antiseptics are used as first aid treatment for cuts and wounds but should be applied only once as a general rule—that is when the wound is first received. The trouble with antiseptics is that as well as killing germs they also kill the surrounding tissues which antibiotics never do.

Antiseptic sprays to purify the air of a room or to destroy germs lurking in the dust on the sick room floor—or any other floor—are practically useless.

To quote the *British Medical Journal*: There is no good scientific evidence that any of the chemical air disinfectants can control the spread of infection in places such as schools, offices or cinemas. Nor is there good evidence that any substantial effect on the spread of illness can be obtained by disinfection of dust.

Neither is there any good reason to believe that mouth washes and gargles have any effect other than making the mouth feel fresher and (temporarily) removing mouth odour—by covering it up with the scent of the antiseptic. Mouth washes are in contact with the bacteria for far too short a time to have any damaging result and in the case of tonsillitis and other diseases all the important bacteria are hidden far out of any danger from gargles.

Antibiotics

The antibiotics—penicillin streptomycin erythromycin terramycin aureomycin and chloramphenicol—have already been dealt with and only two important practical points need to be mentioned. These are that although most of such drugs are entirely safe under ordinary conditions it is extremely dangerous for the layman to use them without medical guidance. If for example people get into the undesirable habit of sucking penicillin lozenges for sore throat and keep on doing this every time the sore throat returns they may become sensitised to penicillin so that when they become really ill—say with pneumonia—the serious illness no longer responds to the drug. Or the same habit may make them allergic or hyper-sensitive to penicillin and an injection given later may have serious and even fatal results.

Doctors no longer use the lozenges anyway because of this danger and another one which is that excessive use of antibiotics may kill not only the dangerous bacteria but also the ones which are helpful to the body. When this happens other types of organism which are not affected by antibiotics will multiply in the absence of the bacteria which normally keep them under control. Thus chloramphenicol or aureomycin by killing useful germs in the large intestine may cause vitamin B deficiency and when the non-sensitive organisms have their natural enemies removed they may step in and multiply causing inflammation of the mouth diarrhoea and occasionally a fatal bowel infection. Chloramphenicol is too dangerous for general use.

General Treatment of Fevers

Fevers are ordinarily heralded in by a rise in temperature which is noticeable either by a flushed face or by alternate sensations of heat and cold. A patient with a high temperature may have shivering attacks known as rigors. Tell the doctor.

A high temperature does not necessarily (especially in a child) mean that the trouble is serious but the lay person should always treat it as such and certainly call a doctor if the patient is a child or an elderly person.

Even the trained physician finds it difficult to tell one fever from another in the early days for most of the common fevers begin in more or less the same way. It is only when a rash or some other more definite sign becomes evident that a certain diagnosis can be made and these may not show themselves until the patient has been feeling run down and fevered for some days. In ordinary although a clinical thermometer is a very useful thing when properly used many a

doctor must feel that in unskilled hands it is a menace. The fussy type of mother who is constantly taking her child's temperature when ever it looks in the slightest degree different from usual (probably it is simply feeling justifiably bored with its parents) not only causes anxiety to herself but also gives the habit of anxiety to her child. The child is made to feel that the world is a dangerous place full of germs and all sorts of causes for fear—as indeed it is but one needs a sense of proportion and other dangers which we think much less about are at least as frightening and twice as deadly as most germs. Whatever you do don't get the thermometer habit your child so far as fevers are concerned is a good deal tougher than you.

Briefly then the way to treat a fever in the early stages before the doctor comes and before one knows exactly what is wrong is as follows:

(1) Put the patient to bed

(2) Give little and easily digested food if the patient wants none give none

(3) Give plenty to drink—the proprietary preparations containing lemonade and glucose are excellent but water weak tea with sugar or home made lemonade with squeezed out lemon juice and sugar which ever the patient likes best are at least as good

(4) Aspirin is useful to relieve headache or other pains and will reduce fever for two or three hours. But it will cure nothing. The patient will be more comfortable but his illness will not be cured by aspirin except in certain very special cases. Soluble aspirin is best. Do not have special children's aspirins in the house. They are often nicely flavoured the children are tempted to eat them like sweets and there have been serious cases of poisoning. For small children use suitably small quantities of ordinary adult soluble aspirin having checked the dose with your doctor. Other methods of cooling seriously fevered patients such as bathing tepid sponging etc are strictly for the doctor to prescribe. A patient as hot as that should be in a doctor's hands anyway.

THE INFECTIOUS FEVERS

The remarks made above apply to the management of any fever and we are now going to discuss particular infectious diseases beginning with the common childhood fevers then passing on to less common ones tropical diseases and worm and parasitic infestations.

The common infectious fevers are caused by bacteria or viruses and it is useful to know the meaning of the following terms. *incubation period* is the time which elapses between being infected and developing symptoms. *prodromal period* is the time which elapses between the end of the incubation period and the appearance of a rash. *quarantine period* the maximum time during which a person who has been in contact with the infection may develop the disease. It is usually two days more than the incubation period. *isolation period* the time a patient is supposed to be isolated.

Views regarding the common infectious fevers have changed a good deal in recent years. Disinfection of rooms is now regarded as almost useless and more cases are treated at home. Quarantine in the case of the common fevers is thought by a good many doctors to be a waste of time since all it can do is to postpone infection from early childhood to early adult life when it is likely to be more serious. For it is a characteristic of these fevers that they affect the adult much more violently than they do the child. However on this and all other points you will have to be guided by the opinion of your family doctor.

Virus Diseases.

First we shall take the common virus diseases, measles chickenpox, and rubella or German

measles then the other virus diseases mumps infective hepatitis virus pneumonia and some less common conditions which do not always produce a typical rash as in the case of the first three.

In nearly all of these fevers there is a long incubation period and one infection gives immunity or life.

Measles The incubation period is 10-11 days. The first sign is the appearance of symptoms rather like a severe cold. The eyes become red and exposure to light is unpleasant, the nose runs, the throat becomes inflamed and a dry harsh cough develops. There may be headache and the temperature rises to 102 or more. Usually the patient is a child and especially typical is the development of so called Koplik's spots which are small bluish white raised spots seen on the inside of the cheek and the back of the mouth. The rash begins on the fourth day of the prodromal period and 14 days after the initial infection. It shows on the forehead and behind the ears spreading within a day downwards over the whole body. In another two days it starts to disappear but often leaves behind a sort of brownish staining which may last for one to two weeks.

Measles can be serious especially in very young children because of its complications such as bronchopneumonia and infection of the ear which can now be treated with antibiotics. These drugs have no effect on the measles virus but only on the secondarily invading bacteria which have invaded the lungs and ear during the illness. The illness can be attenuated or lessened by injection of antibodies (gamma globulin) from an immune adult and this is often worth while in the very young.

Rubella or German Measles Incubation period 14-19 days. A mild fever similar to measles except that the rash is usually the first sign that anything is wrong and the temperature is rarely above 100°. The eyes may be pink and there are enlarged glands at the back of the neck. The rash disappears completely in thirty six hours. There are no complications.

German measles in itself is harmless but if a woman gets the disease in the early months of pregnancy malformations in the child may appear at birth. Hence some doctors believe that girls particularly should have the opportunity of contracting German measles before they grow up. There is no special treatment except the general rules for fevers given above.

Chickenpox Incubation period 14-15 days but may be more variable. In children chickenpox is a mild fever which begins with the appearance of tiny blisters on the chest and back. These later spread outwards to the legs arms and face and cause itching. Treatment is the general one for fevers already described. Calamine lotion or dusting powder will be helpful for the irritation, and the child's nails should be cut short to prevent scratching and infection of the spots. Whereas children are usually little bothered by chickenpox young adults may be much more drastically affected—a temperature of 104° is not uncommon, and there may be severe headache.

Mumps Incubation period 17-18 days. Everyone knows the typical appearance of the patient with mumps—the swelling in the salivary glands in front of the ears which makes the face look full. This causes pain later on, and it may be difficult to open the mouth. Temperature is not usually high (about 101°). Although uncomfortable mumps is rarely dangerous but orchitis—swelling of the testicles—is sometimes a complication. Fluid diet should be given if eating is painful, with mouth washes and rest in bed.

Infective Hepatitis Hepatitis means inflammation of the liver and infective hepatitis which is much the commonest cause of jaundice in young adults is a virus infection of the liver. In fact this disease caused serious difficulties during the Italian campaign of 1943 and has probably become more frequent (or at any rate, more

frequently recognised) in this country since the War. The main symptoms are fever followed by jaundice which is first noticed in the whites of the eyes as yellow staining then in the skin. The urine becomes coloured also and this is most easily noticed if on shaking in a bottle the froth shows coloration. If the froth remains white no jaundice is present. Treatment is a matter for the doctor but great care should be taken both by the patient and the e in contact with him to wash the hands thoroughly after urinating or defecating after handling utensils from the sick room, and both before and after eating for the disease is very infectious.

Virus Pneumonia Pneumonia is usually caused by bacteria and when we speak of pneumonia that is the type we ordinarily refer to. Virus pneumonia is known by doctors as pneumonia and is believed to be closely related to influenza. There is no specific treatment so far and since diagnosis is a specialist matter little more need be said except that the symptoms in general resemble those of ordinary pneumonia. Pasteurosis another virus disease can also lead to pneumonia and although there is no specific treatment for virus infections of the lungs it is always worth while trying the antibiotics or sulpha drugs in view of the possibility that the lung condition may be caused by a secondary invasion by bacteria.

Influenza While serious epidemics of influenza take the form of a very dramatic and often fatal disease—for example the epidemic of Spanish flu which followed the First World War killed more people than the actual fighting—the milder type more usually seen is difficult to distinguish from the common cold. In fact many people who complain of a dose of the flu are suffering from simple colds.

However a sudden onset aching in the muscles of the back and legs and redness of the eyes would suggest influenza and especially typical is the depression and weakness which follow in influenza but not a cold. The measures suggested above for the general treatment of fever should be applied but the depression and weakness which follow influenza may need special treatment by the doctor.

Colds Although everyone thinks he or she knows what a cold is the issue is not so simple for the symptoms of fever running nose and a run down headachy feeling are found in many illnesses. They may be observed as we have seen in the early stages of measles before the arrival of the rash or in a number of other fevers such as whooping cough. Mild attacks of influenza (see above) may resemble the common cold and blocking of the nose with discharge and fever may be due to sinusitis—although here there is usually pain above between or below the eyes. Colds can be caused by any one of thirty different viruses known as rhinoviruses as well as by others which cause influenza or infect glands (adenoviruses). This is why a single cold does not confer immunity on the sufferer. It is probable that you will not catch a cold from the same virus at least for the rest of the year but there are all those others waiting to infect you with other colds in buses tubes and other crowded places. Like all infections do not forget that the best way to avoid them is to keep generally well and in a good nutritional state. Do not spend money on injections or other vaccines. They do not work probably because of the multiplicity of viruses involved. It is also unlikely that added vitamins or other expensive additions to the normal diet will do any good at all provided you are eating sensibly. There has recently been a vogue for treating colds with massive doses of Vitamin C. This doesn't work either as has recently been proved.

Polio Polio or infantile paralysis as it is used to be called is a virus infection of the motor nerves—the nerves of movement—at the point where they leave the spinal cord. Fortunately all the nerves are never affected, but only a few controlling one or more muscle groups.

If these groups happen to be the ones controlling breathing or swallowing (which fortunately is not very common) the results may be serious but ordinarily the muscles affected are those of the legs or arms. Polio-myelitis is almost as common now in adults as in children. Usually it occurs in small epidemics after hot weather that is in summer or autumn and it often seems to strike the fairly healthy normal people. This however is not because healthy people are specially prone to it but because those living under less hygienic conditions are more likely to have developed immunity. In point of fact the majority of cases of polio are so mild that they are never discovered at all and paralysis does not develop. Such people are especially dangerous precisely because they pass unnoticed and spread the disease to others.

Like many other infections polio begins with sore throat fever and sometimes vomiting five to ten days after contact. There may be severe headache and rigidity of the neck muscles. Paralysis is noted about the second or third day after this and is usually at its maximum from the start although this is not always the case. This stage lasts two or three weeks by which time the temperature is down and the paralysis greatly improved although further improvement may go on up to eighteen months after the onset stage.

This is another disease which has been dramatically reduced and even wiped out in many areas by the widespread use of vaccine. However when the illness is already present attention is directed to relief of discomfort resting and pinning the affected limbs and preventing spread of infection to others. The Kenny method devised by Nurse Kenny and much publicised as a means of reducing permanent paralysis is not believed by most doctors to be any improvement upon orthodox methods. The use of the iron lung is restricted to cases where the muscles controlling breathing are attacked and any permanent paralysis of the limbs can often be helped by surgical operation.

Encephalitis This is an infection of the brain caused by a virus first noted in Vienna in 1916. There was an epidemic in London in 1918 but it is not very common today.

Smallpox Smallpox was once common in Western Europe and as late as the early nineteenth century was not unknown in Britain. Now since the introduction of vaccination it is comparatively rare in civilised countries although minor epidemics have occurred here recently. Jenner who introduced vaccination noted that dairy maids who had suffered from the mild disease known as cowpox contracted from the udders of infected cows and transmitted to the hand of the dairy maid did not develop smallpox. In fact cowpox is a mild form of smallpox modified by transmission through cattle. Vaccination should be carried out at the age of three months and repeated at the ages of seven, fourteen and twenty-one years—also at any time when an epidemic occurs or when travelling to any part of the world where smallpox is prevalent or where immigration laws stipulate that it must be done. Many countries insist on an international certificate of recent vaccination before landing. Your family doctor will make out the certificate (he is entitled to charge you for it) and your local Medical Officer of Health will counter sign it. Smallpox is one of the diseases which can very readily be spread from countries where it is prevalent because of the great increase in numbers of people travelling about the world by air. Smallpox attacks people of all ages and is carried by excreta and droplet infection but particularly by the dried scales on the skins of convalescent patients—it is now most common in the tropics.

Smallpox is similar in many ways to chickenpox. Typical cases are easy for the qualified doctor to distinguish from one another but one of the difficulties of vaccination (as with Typhoid, and other artificially conferred immunities) is that the typical signs are often modified. Differential diagnosis is a job for the expert and if your own doctor is in any doubt he will consult with the local health authorities. The disease begins with

shivering headache and backache and the temperature is raised to 102–104. On the third day a rash appears which turns into small blisters on the sixth day and the blisters become filled with pus by the ninth day. On the twelfth day they burst and form crusts. Unlike chickenpox in which the rash starts in the middle of the body and works towards the outer parts smallpox produces a rash which begins in the scalp, forehead, wrists and feet and then moves towards the middle.

Smallpox is a serious disease and the result depends largely upon whether the patient has been vaccinated within seven years of the attack. Contacts should be vaccinated and kept under observation for sixteen days. The patient must be isolated until all the scabs have separated and the skin healed. An effective drug has recently been announced.

Glandular Fever This is sometimes called infective mononucleosis since one of its features is an increase in certain mononuclear white cells and an alteration in their appearance. Another feature is an apparent infectivity. Beyond this the disease is a great mystery and although it is probably caused by a virus it may even be related to other (malignant) diseases of white cells. This one however is not dangerous although it often causes a lot of trouble by dragging on for many weeks. The main symptoms are fever, enlargement of lymph glands and sore throat. The patient feels very debilitated and often very depressed. Diagnosis is often very difficult but there is a blood test known as the Paul-Bunnell test which is almost specific for the disease. The patient is usually presented as a case known to doctors as P.U.O. meaning Prexenia (fever) of Unknown Origin. He has often been treated with several antibiotics one after another without effect because the causal agent is not affected by these drugs. He is only very mildly infective and it is unusual to insist on isolation or quarantine.

Typhus This disease used to be known as jail fever because it was frequent in prisons but overcrowding, poverty and bad hygienic surroundings anywhere are suitable conditions for epidemics of typhus. Improved conditions in industrialised countries have made it unusual since typhus is carried by a virus carried from one person to another by lice and where lice are absent the virus is powerless to enter the human body.

Typhus comes on suddenly with a rise in temperature of about 102 but within four days it may be as high as 107. There may or may not be a rash at this time and in the second week when the temperature is at its highest there is delirium, weakness and a feeble pulse. The typical typhus rash appears about the fifth day as reddish blotches on the chest, abdomen and wrists.

Typhus is needless to say very serious but responds to such modern antibiotics as chloramphenicol, aureomycin and terramycin. Preventive measures are directed towards destroying all lice with D.D.T.

Rabies Finally we shall deal very briefly with a number of less common virus diseases beginning as is appropriate with *hydrophobia* or *rabies* since it was in this infection that the great French scientist Louis Pasteur (1822–95) showed the possibility of prevention by vaccination. Unlike Jenner with his ready-made cowpox virus which we have seen to be the virus of smallpox weakened by natural passage through cows, Pasteur had to weaken the rabies virus by passing it through rabbits. The rabbits were infected and after death the spinal cord was dried and powdered, a solution passed through another rabbit and so on until the virus was sufficiently weakened.

Rabies is spread by the bite of infected animals, usually dogs, cats, or wolves who are driven mad by the disease. In Trinidad however it has been spread by vampire bats. Those who are bitten usually show no symptoms for six weeks or more.

but sooner or later convulsions and delirium arise which within four to five days are fatal.

There is no cure once the symptoms have developed, but Pasteur's serum, if given soon after the bite, prevents illness in the vast majority of cases—the sooner after the bite the better the outlook. Dogs should be muzzled in areas where the disease is common, but quarantining imported dogs has made the infection almost unknown here.

Psittacosis This is another virus disease which is of interest mainly in that it is spread by birds of the parrot group such as parrots, love birds, macaws and the rest. It occasionally occurs here in people who have been in contact with birds of this type and is serious both to the bird and its owner. As in the case of rabies, quarantine regulations have greatly reduced the likelihood of infection in Britain.

The symptoms of psittacosis are fever, cough and bronchitis. The disease is especially dangerous to old people, but it responds to the same antibiotics as typhus.

Sandfly Fever or Phlebotomus fever, Dengue or breakbone fever and Trench Fever are all some what similar conditions in that they resemble influenza and are rarely fatal. They are all due to viruses spread in the first case by sandflies in tropical climates, in the second by mosquitoes in tropical climates, and in the third by lice in temperate climates. They are all typical soldiers' diseases, the first two were common in the Middle East and Far East during the last War, the third during the First World War in France.

Yellow Fever Of all the virus diseases only four can be prevented by vaccination—smallpox, hydrophobia, yellow fever and poliomyelitis. Yellow fever is carried by a mosquito known as *Stegomyia*, common in South and Central America and in African ports. For its spread it therefore needs a hot climate, the *stegomyia* mosquito and an infected person.

In 1898 the United States was at war with Spain in Central America, where yellow fever was a serious problem. Following this war the United States by this time acutely aware of this terrible disease asked a Dr G. E. Waring to deal with it in Havana, where it was rife. But Waring died of yellow fever, as had many millions before him without knowing its cause and it was left to Walter Reed, who died in 1902, to prove the connection between the mosquito and yellow fever. By a vigorous war on the mosquito the disease has been eradicated from Havana and the West Indian islands and Reed's discovery made possible the building of the Panama Canal. Ferdinand de Lesseps, the builder of the Suez Canal, had made a similar attempt in Panama, but had been beaten amongst other factors by yellow fever.

In yellow fever there is a sudden high temperature, aching of limbs and head, jaundice and black vomit, the pulse rate falls as the fever rises. Previous vaccination seems to be preventive if undertaken in time.

Conclusion

All these virus diseases have this in common that for many there is no specific cure, although smallpox, rabies, yellow fever and poliomyelitis can be prevented by vaccination, or by the social control of the creatures carrying the virus. Some of the larger viruses (psittacosis, whooping cough) are destroyed by certain antibiotics. There is usually a long incubation period. Finally the question will sometimes arise of protecting some people from German measles or measles with gamma globulin containing another person's antibodies to the disease. This may be considered for measles in very young patients or to protect the foetus in pregnant mothers in contact with German measles.

Bacterial Diseases

Bacterial diseases differ from virus infections in a number of respects: their incubation period

tends to be shorter, living, the disease once does not often confer lifelong protection, and unlike virus diseases most bacterial diseases respond to one of the antibiotics or sulphonamides. In many cases it is possible to inoculate against the disease to prevent it occurring, as we have seen is possible with only a few of the virus diseases.

Scarlet Fever and Other Streptococcal Infections In the days not so long ago before the arrival of chemotherapy (sulphonamides) and antibiotics streptococci were very much feared and even caused a high mortality, particularly in such susceptible groups as children and mothers and babies in maternity hospitals. They are still taken very seriously in the latter and rightly so, although one wonders how much of the mystique is simply a hang over from the days thirty years ago when many mothers died from childbed fever. All signs of infection, such as fever during the puerperium (the period following child birth) must be promptly dealt with by a doctor and only occasionally now is there real cause for anxiety provided treatment is prompt and rigorous.

Scarlet fever is much less common and very much less serious an illness than it used to be partly because of the effective treatments available today, but also because of a definite but unexplained reduction in its severity. Perhaps the streptococcus has changed, and certainly the improved physical condition of people who are now much better fed and housed than they were has helped to ward off the terrors of this disease as of so many other infections. The classical picture of signs and symptoms is now so rarely seen that it will not be further described.

The importance of streptococcal infections has shifted from the initial infection, such as a sore throat, to some serious conditions which occasionally arise as a result of some form of delayed sensitivity to the bacteria. Acute rheumatism or rheumatic fever (not to be confused with ordinary aches and pains nor with rheumatoid arthritis) occasionally arise in people who have had a sore throat a few weeks before. Since the streptococcus is not the direct cause of the damage which may consequently occur in the heart or kidney, the antibiotics are of no answer except sometimes to keep off further streptococcal invasions.

Diphtheria This used to be an extremely serious disease, but immunisation has made it almost unknown. It is important therefore that all children should be immunised. There are many modern and up to date doctors who have qualified since the war who have never seen a case because it has become so rare and in spite of the propaganda of certain ill-informed people, this saving of children's lives is entirely the result of nationwide inoculation during the war and since. The following description is of historic interest only and will remain so if a high level of inoculation is kept up by parents.

In a typical case of diphtheria the incubation period is about three days. The patient is a child who becomes ill and pale looking (i.e. the onset is not sudden as in many fevers, but insidious) the temperature is only slightly raised to perhaps 99° or 101° and although there may be no complaint of sore throat, examination will reveal inflammation with—and this is typical of diphtheria—a grey membrane spread over the tonsils, the palate and the back of the mouth generally. The diphtheria germ does not spread within the body. It stays at the place where it entered (in this case the throat) and sends its toxins throughout the body.

Even after the acute phase is over the patient must not be allowed to walk, because the diphtheria toxin is particularly poisonous to the heart. The ordinary rule is at least one or two months in bed. Diphtheria also occurs in the larynx—in pre-inoculation days many children choked to death with this form of the infection. In the nose and although this is not generally known, wounds can be infected. The so-called "Desert sore" of the North African campaign seem to have been caused by diphtheria-like organisms.

Diphtheria may lead to paralysis of the throat, with difficulty in speaking or swallowing and paralysis of the eyes or limbs, these are due to

neuritis caused by the influence of the toxin on the nerves

Whooping Cough. For many years whooping cough has been regarded merely as a bother to the patient and a nuisance to others as in fact a trivial disease. Unfortunately this is not so because statistics show that it causes more deaths than polio diphtheria scarlet fever and measles all put together.

Whooping cough begins in a child as an ordinary cold with cough and slight fever and this stage lasts for a week or ten days. Then the paroxysmal stage begins as a series of coughs following in rapid succession during which time the patient is unable to breathe. The whoop is caused by the noisy in-drawing of breath when the fit stops. The face may become blue and congested. Bronchitis is usually present and bronchopneumonia may result as a complication so inoculation of all children before the disease has a chance to strike them is most important.

Once whooping cough has begun there is no specific treatment although modern drugs can reduce the frequency of the fits of coughing. The antibiotic chloramphenicol has been used for this disease but the general opinion is that it is ordinarily of little benefit. Chinese physicians once described whooping cough as the "hundred days cough" and the cough may indeed continue for at least a hundred days.

Food Poisoning Diseases

Strictly speaking there is no such thing as food poisoning if one is thinking of poisoning in terms of anything apart from germs. But not so long ago it used to be thought that decomposition of food in itself produced poisons known as ptomaines which were deadly to those who swallowed them. All food poisoning is caused by infection of food with bacteria and by no other cause—unless of course we are thinking of the kind of poisoning which is the concern of the lawyer rather than the medical man.

Here we are considering those diseases which are commonly spread by contaminated food or drink. The classification is not scientific but then no scientific classification has as yet been devised. First we shall deal with typhoid paratyphoid, and dysentery—uncommon here in Britain although *Sonné dysentery* is fairly frequent. Then there is gastro enteritis (which means irritation of the stomach and intestines) which is caused by staphylococci and the germs of the salmonella group and lastly botulism which is rare.

Typhoid and Paratyphoid. These diseases are spread by infected water food or hands—especially uncooked food such as milk salads oysters and shellfish. Flies too play some part in spreading the disease. Some people are carriers and carry and excrete the germs without being themselves affected for example.

Typhoid Mary. A carrier in the United States in the early years of this century spent a large part of her life in custody as a public danger although she did not show any symptoms of typhoid. Nevertheless this woman caused a great deal of illness in others in her chosen profession of cook.

The influence of Chadwick's propaganda for pure water supplies is shown by the fact that deaths from typhoid still 332 per 1 000 000 in 1870 fell to 198 per 1 000 000 at the beginning of this century. In the 1920s the death rate was only 25 per 1 000 000 and now it is even less.

Typhoid fever begins like most fevers with headache raised temperature and general feeling of unwellness. This stage lasts about a week and then the rash appears in the form of rose red spots on the front of the chest and abdomen and on the back. In the second week there is great weakness sometimes diarrhoea flatulence, and mental dullness, together with dry and cracked lips and tongue. The third week is the week, in hopeful cases of gradual decrease in temperature and other symptoms and the fourth week is the week of convalescence.

Complications are perforation of the intestine (which needs surgical treatment) delirium, and bronchitis.

Paratyphoid fever is a milder form of typhoid (there are two forms A and B) ordinarily it can be diagnosed only by scientific tests. The main thing is to inoculate contacts with A.B. vaccine and to protect food supplies. Treatment is with chloramphenicol.

Dysentery. Dysentery may be caused either by a bacterium or an amoeba. The first type is known as bacillary dysentery the latter as amoebic dysentery (which is dealt with under tropical diseases). Infection is spread in much the same way as in typhoid. There is high fever abdominal pain and diarrhoea at first consisting of faecal matter then blood and mucus. In severe cases the death rate used to be over 20 per cent.

Various bacilli cause dysentery. The common tropical types are the Shiga and Flexner groups but in this country most epidemics are due to the milder *Sonné* group.

However in all these infections sulphaguanidine one of the sulpha drugs brings rapid relief but care must be taken to avoid infection of other people.

Diarrhoea and Vomiting. Leaving out typhoid and paratyphoid fevers and dysentery there is a group of infections known as D & V—diarrhoea and vomiting. In Britain D & V is mostly due to

- (1) *Salmonella* infection
- (2) Staphylococcal infections
- (3) Other bacteria ordinarily harmless such as *Bacillus coli* when present in sufficient quantity.

Salmonella infections are the most serious of this group. They affect the small intestine and produce vomiting severe abdominal pain and diarrhoea. These symptoms occur about one day after eating infected food and usually clear up within about two weeks but occasionally death results. *Salmonella* bacteria are most likely to be found in meat egg powder vegetables and ducks eggs but staphylococci are able to grow in milk products such as ice-cream and cream buns. Food poisoning from staphylococci is seldom severe and recovery takes place in about a week. Nevertheless it is extremely infectious and causes a great deal of lost time in industry and temporary illness in institutions for it is in such situations that it is most likely to occur.

Staphylococcal Food Poisoning has greatly increased in recent years so it is important to know what circumstances are likely to cause it. The reason for its increase has nothing to do with many people suppose with the greater use of canned foods but it has much to do with the greater use of communal feeding and canteen meals. It is possible for bacterial toxins in infected food to bring about illness even when the canning process has killed the bacteria but it is certainly extremely rare. Canned foods in fact are much safer than so-called fresh foods in this respect—except when they have been opened, left about and then re-heated. The same applies to the re heating of any kind of food.

The real enemy is the canteen worker with a boil, a discharging nose dirty hands or a septic finger. Occasionally food may be infected in the larder by rats or mice but the sort of canteen or restaurant where this can happen has little to commend it. Frankly these infections are caused by dirty or stupid people who do not realise that their sore finger or boil can become someone else's diarrhoea and vomiting. Where children are concerned the outlook is potentially more serious and in the early part of this century the summer time procession of baby coffins was all too familiar. Infection is much more common in artificially fed babies or in older children who eat infected ice-cream. However trivial the condition may seem, diarrhoea and vomiting with fever in a child should never be ignored. Those in charge of canteens or restaurants must ensure that staff is supervised that anyone with a septic infection is put off duty and that all know about washing after visiting the lavatory and absolute cleanliness.

Bacilli normally present in the intestine such

as bacillus coli can cause infections if absorbed in large amounts or if of a different strain from those in the patient's intestine. They are not usually serious.

Botulism Now uncommon, this is the disease which used to be known as ptomaine poisoning on the theory that it was caused by poisons produced by bad food apart from germs. In the 1920s a party of picnickers at Loch Maree in the Scottish Highlands developed botulism and a number died with the result that the disease attracted much public attention. Botulism is caused by a germ, the bacillus botulinus which is peculiar in that like tetanus its poison attacks the nervous system rather than the intestines resulting in its double vision paralysis beginning in the face and spreading downwards and difficulty in swallowing. It is found in tinned fruits or vegetables containing the toxin even when the germ has been killed but as we have already seen the toxin comes from the bacilli not from decomposition of food as such (in fact food does not decompose in the absence of germs). Death is common in botulism but an antitoxin is now available which if used in time can cure the disease.

Tuberculosis No disease causes more public concern and no disease is more difficult to describe than tuberculosis for like the streptococcus or the staphylococcus the tubercle germ can attack many different parts of the body and manifest itself in many ways. Furthermore it is a widely spread disease infecting not only humans but also cattle, birds and reptiles. But here we shall be concerned with those types common to man—the human and bovine (i.e. the type occurring in cattle which can be spread to man by infected milk).

The tubercle bacillus is particularly hardy so that when coughed or spat out on the ground it continues to be infectious for a long time. Infection is therefore caused by (a) drinking infected milk, (b) droplet infection through having germs coughed in the face, (c) breathing in infected dust. In other words tuberculosis is caused by absorption through either the lungs or the intestines, the former is common in adults the latter in children.

But there is a good deal more to the problem than this, we know for example that over 90 per cent. of people in industrialised countries have been infected with T.B. in early life and have conquered the infection. So the question arises what conditions predispose to T.B.—why do some people get over the early infection and others not? There are two answers to this question, one is certain—that those who are impoverished and do not get enough food are liable to T.B. the second is not so certain—that mental stress plays some part. Yet there is reasonably good evidence that such stress as a broken love affair can cause lowered resistance to breakdown so that when germs are encountered infection will occur.

In children lung tuberculosis is not common, but tuberculosis of the bones and glands is as is also infection in the abdomen, the kidney or spine and worst of all tuberculous meningitis. These are often of the bovine type from infected milk. Ordinarily T.B. in children is less serious than adult infections but tuberculous meningitis used to be almost invariably fatal until streptomycin was discovered.

Adult tuberculosis usually occurs in the lungs or the pleura—the thin membrane surrounding the lungs. In younger people military tuberculosis which is a form of T.B. blood poisoning or septicaemia is a very serious condition and the infection spreads throughout the whole body in a few weeks.

Lung infection begins gradually in someone who has previously felt unwell. There may be cough and later blood stained sputum (although blood which is coughed up does not necessarily prove that T.B. is present). Whatever means of treatment are used the struggle between disease and patient is likely to be fairly long but the outlook is now good. The closure of the Swiss sanatoria is due partly to modern disbelief that air in one place is better than that in another but mainly to improved treatment.

Prevention depends on legal action ensuring

tuberculosis free herds of cattle on control of spread of the disease by those open cases who carry germs in their sputum on the use of vaccination in childhood with B.C.G. vaccine (which you can ask your doctor about).

Many methods are used in treatment, new drugs such as streptomycin, isoniazid and P.A.B. lung surgery rest and so on. At any rate tuberculosis is being got under control but anyone who is worried can get a free X ray at the nearest M.V.S. Radiography Centre. For children there are skin tests to show whether there is susceptibility to T.B.

Septicaemia Commonly known as blood poisoning is one of those diseases of which text books prior to the Second World War used to say died usually occurs.

Blood poisoning occurs generally by spread from some septic area such as a wound (or even a small prick) after childbirth or any place where certain germs have got admission to the body. The most usual germ is the streptococcus although the pneumococcus—which ordinarily causes pneumonia—and the staphylococcus may also cause septicaemia.

Fever comes on suddenly and rises rapidly with headaches, sweating and shivering. The patient is obviously very ill and later there is wasting and delirium. The white blood cells increase in number. Septicaemia sometimes occurs without any apparent local infection in those who are weak and debilitated.

Pneumia is a type of septicaemia which leads to the formation of numerous abscesses throughout the body. Its symptoms are the same as described above except that the causative germ is usually the staphylococcus and abscesses are found which may need surgical treatment.

However in both conditions the state of affairs has been revolutionised by the use of the sulpha drugs and antibiotics, cure is now the rule rather than the exception.

Septicaemia should be suspected when any small wound or cut is followed by high temperature and the symptoms described above.

The word *Toxaemia* is used when the germs stay in their original position and produce symptoms by spreading their toxins throughout the body. Tetanus, diphtheria and some kinds of childbirth infection come into this category, the symptoms may vary from mild disturbance to severe illness.

Meningitis means inflammation of the meninges the covering which like a layer of plastic lies over the brain and spinal cord just as the pleura covers the lungs and the peritoneum covers internal organs in the abdomen. (Hence inflammation of the pleura is known as pleurisy and inflammation of the peritoneum as peritonitis).

Various germs may cause meningitis, for example the bacillus of tuberculosis, the pneumococcus which ordinarily causes pneumonia and the streptococcus or staphylococcus but ordinarily the word refers to *Cerebrospinal Meningitis* or spotted fever caused by the meningococcus and occurring at times as an epidemic. It is commonest in the years from infancy to the early twenties and begins suddenly with headache, vomiting and fever. The temperature rises quickly and pain develops in the back and legs on the second or third day a rash appears on the body and particularly on the inside of the thighs. Later there is stiffness of the neck, the head may be drawn back, vomiting persists and the headache can be so severe as to cause the patient to scream with pain.

Fortunately this type of meningitis (and most of the others) respond to treatment with antibiotics or the sulpha drugs so the risks are very much less than formerly.

Pneumococcal Meningitis is an unusual complication of pneumonia and the septic types (*streptococcal* or *staphylococcal*) arise either following an infected fracture of the skull or from infection of the ear or mastoid.

Tuberculous Meningitis has already been mentioned, originally always fatal, it is now treatable with streptomycin.

All these diseases are very much a matter for

specialist and hospital treatment but it is worth while mentioning *bacillus lymphocytic meningitis* in which although all the symptoms of meningitis are present recovery without specific treatment is invariably possible. Meningitis which was during the First World War and after what polio is to us now is no longer common and when taken in time is easily treated.

Tetanus is usually known as lockjaw because there may be difficulty in opening the mouth although this is simply part of a spasm of all the muscles of the body. The tetanus bacillus is found in rich soil—hence the disease is less common in desert areas—and tetanus resembles rabies in that (a) it enters at a wound (b) it affects the nervous system (c) it results in fits and ultimately death.

However active immunisation with T.T. (tetanus toxoid) has resulted in the disease becoming uncommon and even when developed treatment with antitoxin, anaesthetics and curare may lead to cure.

The bacillus is anaerobic (i.e. does not use oxygen) and is most likely to occur in such situations as when a man digging manure or working in his garden sticks a fork through his foot or in war time when he is wounded in soil contaminated with manure.

Undulant fever also known as Malta fever or abortus fever falls into two types, melitensis which infects goats and abortus cattle and pigs. Man gets the disease by reason of close contact with or drinking the milk of infected animals. (The name abortus is given because abortion is produced in cattle and sheep.)

In Undulant Fever as one would suppose the fever goes up and down for two to three weeks it may then go down and rise again persisting for many months. The disease may occur in Britain but modern drugs are on the whole successful in dealing with it. A striking feature of the disease is the combination of a high temperature with an appearance of relative well being.

Another disease carried by mammals is *Glanders* or *Farcy* spread by horses. In glanders there is discharge from the nose and sometimes pneumonia. Occasionally the disease is fatal. In farcy abscesses form usually along the lymph vessels. Both conditions are very contagious and treatment is a matter for a specialist. Infected horses should be destroyed.

Cholera. Cholera could be classified under the head of food poisoning because it is mainly spread by infected water (however like typhoid it can also be spread by flies infected food and carriers) it could also be classified as a tropical disease since although it used to be found in Europe it is now mainly rare in India.

Also like typhoid cholera is caused by a bacillus and can be prevented by early inoculation and care over food supplies—boiling water and milk washing uncooked foods in chlorinated water and keeping flies away.

The fever begins in the usual way with a short incubation period followed by abdominal pain, severe vomiting and diarrhoea. Later with the loss of fluid from the body there may be cramps in the muscles, diarrhoea increases and the motions become of the typical rice water type—i.e. there is no solid matter and the appearance is that of water to which a little milk has been added. This stage is followed by collapse with low pulse and cold hands and feet. Death if adequate treatment is not available results in about 70 per cent of cases.

Anthrax. The bacillus of anthrax like that of tuberculosis can exist outside the body for long periods and like that of tetanus then takes the form of spores or seed like bodies. It is spread by infected cattle and horses which get the disease from eating grass containing spores.

In human beings the form the disease takes depends on where the germ alights. Sometimes it comes from infected shaving brushes when it causes a large sore like a boil on the face known as a malignant pustule. Sometimes it develops in those who inhale the dust from infected hides or wool (hence the name wool sorters disease, which is a form of bronchitis with blood stained

sputum) lastly it may arise through eating infected meat when the result is intestinal anthrax.

In all cases the outlook is serious. Death is common preceded by a high temperature, skin symptoms in the first instance, lung symptoms in the second and food poisoning symptoms in the third. Serum and arsenical preparations were formerly used but now the sulphid drugs seem to offer more promise.

Diseases Caused by Fungi.

There are only two important groups of disease caused by fungus, the serious *ail nuyco* is and the relatively harmless if unpleasant *ringworm*. Ringworm or *trinea* will be dealt with later. It affects the hair, the body, the groin (dibolic itch already referred to) and the feet (athlete's foot). Actinomycosis is spread by a fungus in barley and grasses which may reach the human mouth, settle around bad teeth and thence pass to the lungs, the bone of the jaw and even to the intestines or brain. Fortunately this unpleasant fungus which was once difficult to eradicate has proved susceptible to penicillin.

The Venereal Diseases

The venereal diseases are those caused—or at least that is what the name means—by the goddess of love, Venus. Venus of course causes a great deal of trouble but venereal disease is not necessarily the worst she can do. Venereal disease is spread by sexual intercourse with an infected person.

Gonorrhoea is the result of an infection by the gonococcus (*Neisseria gonorrhoea*) and ordinarily comes on after an incubation period of three to seven days. However babies can get an infection of the eyes known as ophthalmia from their mother if she is infected and gonorrhoea in young children is often the result of being in contact with infected towels or clothes. The disease in adults is evident when there is a thick creamy discharge from the sexual organs and sometimes pain on passing water. In infants ophthalmia is prevented by the use of silver nitrate eye drops at birth. Gonorrhoea is fairly easily cured by the use of sulpha drugs or penicillin but unfortunately venereal disease is increasing in recent years and drug resistant forms are becoming more common.

Syphilis is a serious venereal disease caused by a spirochete (*Treponema pallidum*). Stories about lavatory seats are simply stories although it is occasionally possible to get syphilis by other than sexual means, for example it has happened that a man playing football has been infected through his hand being grazed by the teeth of someone with syphilis. But this is very unusual, although kissing can spread the disease. Children too can be born with syphilis (the so called congenital syphilis).

Adult syphilis begins with a sore known as a hard chancre at the point where the spirochete of syphilis has entered. This may be on the lips through kissing or on the sexual organs through intercourse and very rarely as explained above elsewhere. In a short time the chancre disappears and all may seem to be well but this primary stage is followed by a secondary stage with sore throat, a rash, headache and enlargement of glands. This if left alone also clears up but is followed by the tertiary stage in which a chronic infection develops in some part of the body which, presumably is most susceptible in the particular individual. Thus there may be chronic syphilis of the skin, the bones, the heart, liver or nervous system.

In the nervous system the commonest forms are the two diseases of *tabes dorsalis* in which the spinal cord is infected and *G.P.I.* (general paralysis of the insane) in which the brain and mind are affected. These will be discussed under Nervous Diseases.

In congenital syphilis the pregnant mother gives her child syphilis. Such infants are often still born or premature, they look wizened like a little old man, and amongst other symptoms are eye

disease smoothes a flattened nose and when the adult teeth appear the front ones may be notched at the biting surface.

The treatment of course is very much a matter for a specialist but diagnosis is usually made through the Wassermann blood test. It was for syphilis that Ehrlich produced his magic bullet—an arsenical drug known as salvarsan which could attack the organism selectively without harming the body and was the first of the modern specific drugs. Present day treatment is with penicillin. G.P.I. once hopeless is now dealt with by maternal therapy with a good deal of success. Penicillin alone is often adequate.

It is important to understand about venereal disease in general: (1) that it happens to many people who are no worse than anyone else; (2) that many patients believe themselves to have V.D. when in fact they have not; (3) that the best thing to do is to see your doctor as soon as possible—he is not concerned with your morals and the sooner you go the sooner you will get well; (4) every sore in the sexual area need not be V.D. There are other diseases which may be contracted as venereal infections.

Chancroid produces small septic ulcers around the sex organs with swelling of the local glands in the groin which may suppurate. It is caused by a bacillus and can usually be cleared up by sulph. drugs within a week. Scabies and lice often pass from one body to another during sexual intercourse but are not usually thought of as venereal in origin although in many cases they are.

Tropical Diseases

Nothing is more difficult than to define the term tropical diseases. One might define them as the diseases which occur in tropical climates—but then measles occurs there too and if they are defined as those diseases which are found *only* in the tropics the solution is no easier since leprosy, cholera, smallpox and typhus are usually listed as tropical diseases yet were found in this country until fairly recently—and the odd case still is.

But what a story could be told about the conquest of those infections which were—and many still are—the scourge of humanity! One day when generals and dictators are forgotten we shall remember that great international army of physicians and bacteriologists who have saved millions of lives and infinitely reduced human suffering. Koch and Ehrlich of Germany, Pasteur and Roux of France, Ross and Jenner of Britain, Reed of America, Noguchi of Japan and many others. We shall remember how the Jesuit priests brought quinine from Peru to Europe in 1638 the first drug to save people from malaria, how in tropical heat Ronald Ross (1857-1932) peered for hours through his microscope to discover the connection between malaria and the mosquito until the sweat running from his brow rusted the instrument, how Major Walter Reed's work in Havana (1851-1902) made possible the building of the Panama Canal and thank too of the American soldiers who died in helping him to find the cause of yellow fever. In mentioning Jenner once more we should recall Lady Mary Montagu (1689-1762) who brought the practice of vaccination to England from Turkey—or rather inoculating with the pus from smallpox cases. This was of course a dangerous practice but the idea was there. Noguchi, one of the great bacteriologists of the nineteenth century was the son of a poor peasant. He often had to steal to get enough bread even to keep alive but was later to help in our understanding of syphilis and many tropical diseases.

Yet there is still much to do. Take for example the case of Egypt one of the world's poorest countries supporting with the help of water from the Nile about 24 million people. But if the river gives food and drink it does other things for it carries the disease of bilharzia which kills thousands of peasants yearly. In the villages of Egypt as many as 90-100 per cent of the population suffer from this terrible disease. The infantile mortality rate is the second highest in the world—29.5 per cent—seven times higher than that of Holland the average expectation of life amongst the lower classes is thirty one years

of the upper classes fifty to sixty years. The country is ridden with bilharzia, ankylostomiasis, malaria, plague, venereal disease, typhus, tuberculosis and pellagra. Blindness due to trachoma and other diseases affects tens of thousands. Such a situation cannot be treated simply by pouring drugs into the country, what is necessary is social control to enforce purification of the water supplies, the use of insecticides such as D.D.T. to kill the disease bearing pests and removal of the causes of extreme poverty (tuberculosis and vitamin deficiencies which are common in Egypt are diseases of malnutrition).

Relapsing Fever, common in India and Africa is caused by bad hygiene (rubbing infected lice into the skin) the germ is a spirochete similar to that of syphilis but the disease is non-venereal. Relapsing fever gets its name from the fact that the temperature remains high (103-104 °F) for about a week returns to normal for a week and rises again. There may be three to five relapses of this sort. Cure can be brought about by the arseno benzol drugs used in syphilis. Lice of course should be dealt with.

Epidemic Jaundice (also known as Weil's disease or—if you prefer it—ictero haemorrhagica spirochaetosis) is also caused by a spirochete and spread by rats. Now it is rarely found in Europe although it occurred in the trenches during the First World War in men working in sewers and in the women who worked in the fish market of Aberdeen which at one time was rat infested. It is rarely fatal but leads to high fever and jaundice. Anti-syphilitic drugs are useless but some of the new antibiotics may help.

Yaws is also a spirochetal disease common in the tropics and particularly in children. It is unpleasant but not serious and tends to clear up in a year or so. There are raspberry like growths on the skin which disappear with the drugs used in syphilis (although the condition is non-venereal). The Wassermann reaction, positive in syphilis is also positive in yaws.

Leprosy. Whereas syphilis, relapsing fever, epidemic jaundice and yaws are caused by spirochetes, leprosy is caused by a bacillus resembling the bacillus of tuberculosis. Leprosy in fact should not be included here at all for it is non-spirochetal and not necessarily a tropical infection. Apart from the difficulty of classification many popular beliefs about the disease are untrue. It is *not* the oldest disease afflicting man, *not* a disease confined to tropical countries, it is *not* very catching, *not* hereditary, *not* incurable, in leprosy the fingers and toes do *not* drop off, it is *not* a divine punishment for wrong doing. So there are many misunderstandings about this disease, and placing it in the wrong part of the medical section is probably the least.

Leprosy is a serious disease not because of its figuring light coloured skin patches and lumps but because it destroys peripheral nerves. Leprosy may disappear spontaneously or it may progress until the face is lion like and the hands and feet wasted and ulcerated. The disease rarely kills but it is the world's greatest crippler.

Leprosy was once fairly common in colder Western countries though its extent was exaggerated. The great majority of the 15 million people who suffer from leprosy live in tropical countries but it still exists in Iceland, Japan, Korea and some of the southern states of the United States. Prolonged and intimate contact with an open case is said to be the main mode of infection but only one infected husband in twenty passes leprosy to his wife.

The sulphone drugs have revolutionised the treatment of leprosy. Given early diagnosis and adequate treatment the great majority of sufferers could be cured. Established deformity (such as claw hand drop foot paralysed eyelids) can be mitigated by reconstructive surgery although lost sensation cannot be restored.

In the past only Christian missions were concerned with the plight of the leprosy sufferer. Now non-sectarian voluntary agencies, Governments and the World Health Organisation have joined in the fight against the disease. Enough is known to control the disease, but not enough is

being done as only one victim in five is at present getting treatment

Plague is another disease caused by bacteria common in Europe at one time but now largely restricted to Asia. Nevertheless it caused millions of deaths in Europe during the years 1348-9 and 1665 and was the 'Black Death' which indeed changed the course of history. Interested readers may read Hans Zinsser's *Plague and History* about this aspect of the disease. Plague is carried by the bite of the rat flea but once people become infected 'spread man' occur from one to the other by droplet infection—i.e. by coughing and sneezing. After an incubation period of two to ten days fever develops rather like severe influenza, and in a day or two the glands in the groin begin to swell followed perhaps by swelling of the glands elsewhere. This is the usual type of plague but it is also possible to get disease of the lungs from droplet infection and blood poisoning from infection of the blood stream. Both the latter types are almost invariably fatal and even the glandular type (bubonic plague) has a mortality of about 80 per cent. The vaccine has given place to streptomycin and sulpha drugs which are also used on contacts.

Although we have little space to discuss the subject of plagues and epidemics in general it is worth noting that serious epidemics have almost always followed wars, revolutions, and economic and political collapse. Thus the Black Death followed the break up of the Roman Empire and in the fourteenth century accompanied the end of medieval civilisation. The Napoleonic wars were followed by other epidemics and the wars of the 1830s in Europe were followed by influenza. In the most widespread outburst of influenza after the First World War more people were killed by the disease than in all the fighting of four years. It is a reflection on the peculiar mentality of Man that this devastating epidemic which affected almost the whole world occupies little space in his history books—we still with few exceptions regard history as the doings of kings, queens and generals. Yet in 1918 20 million men and women and children died from influenza and no cure has as yet been found! Later we shall see that many millions of people die yearly from starvation or vitamin deficiencies. But these facts—the real facts of life—we rarely hear about.

Protozoal Diseases

Nearly all the diseases caused by protozoa are protozoal diseases although one of the best known protozoans is the harmless amoeba found in British ponds. Protozoal diseases are caused by these organisms large in comparison with bacteria which are really one celled plants. Viruses are neither animals nor plants are much smaller than the other two groups and have some distinctive characteristics described elsewhere.

The only important diseases caused by protozoa are sleeping sickness or trypanosomiasis malaria and amoebic dysentery (as contrasted with bacillary dysentery) another disease leishmaniasis—also known by the numerous names of kala azar dum fever and in milder form Delhi boil Oriental sore or Bagdad sore—will also be mentioned briefly. These infections are few but important in their influence on Man for as Dr Clark Kennedy has pointed out malaria until recently was responsible for one fifth of all human sickness sleeping sickness not so long ago caused a large part of Central Africa to be uninhabitable and in some areas of the tropics there are probably more people with, than without amoebic dysentery.

Malaria The word of course means bad air just as influenza means influence—in Italian *influenza da freddo*—the influence of cold. Human beings have a natural tendency to suppose that when two events occur together then one must be caused by the other. Yet, although malaria and bad air may often go together and influenza and cold it does not follow that bad air (whatever that may be) causes malaria nor that cold causes influenza. In fact

the anopheles mosquito carries the amoeba of malaria and the mosquito prefers climates which some people might describe as bad but it is the amoeba not the air which causes the disease. Anyhow the unfortunate mosquito might well use the phrase 'honoured by many generations of schoolmases'. It hurts me more than it hurts you! For the mosquito too is sick and passes on its sickness to the person it bites.

There are several types of plasmodium—which is the scientific name for this amoeba—producing attacks of fever varying in severity and frequency benign tertian quartan and malignant quartan. Entering the body from the mosquito bite the parasites penetrate the blood cells multiply there and finally burst into the blood stream. When this happens the temperature rises and then they return to the cells to carry out once more the same procedure. Depending on the type the attacks of fever may be at intervals of three or four days severe or milder. When someone with malaria is bitten by a mosquito the infection can be transmitted to the next person it meets but malaria is not infectious from one person to another directly. Quinine of course is the time honoured remedy but many other drugs are now available mepacrine palmarquine atabrin and even a sulphonamide derivative known as proin have been tried. The drug must be taken long enough for the infection to die out otherwise relapses can occur even after leaving a malarial country (but it is only fair to say that just as some people continue to give themselves the title of Major when they have left the Army so others long in Britain continue to describe attacks of cold or flu as 'old malaria again' when to say the least of it they are exaggerating).

Important as are the drugs used in the treatment of malaria even more so is the control of the parasite bearing mosquito. The eggs of mosquitoes hatch in water and there the young or larval forms can be attacked by pouring oil on the surface of pools so that they are unable to breathe or by introducing small fish which have a partiality for them. Adult mosquitoes can be killed by DDT and other insecticides or kept away by nets over beds and skin creams. Finally anti-malarial drugs can be taken in dangerous areas. Whereas anopheline mosquitoes were once well on the way to getting rid of Man now Man is well on the way to getting rid of mosquitoes.

Blackwater Fever is a sequel to malaria in tropical Africa and some parts of India. Rather illogically it is described as Blackwater although the urine is red and the skin is yellow but the result is due to breaking down of the red blood cells by some malarial toxin. Possibly too much quinine may help in producing the illness. Treatment is to give plenty of fluids and no quinine or any other anti-malarial drugs in the early stages. The death rate is about 25 per cent.

Trypanosomiasis or sleeping sickness—not to be confused with *sleepy* sickness which has already been dealt with under the name of encephalitis lethargica—is essentially an African disease (although also found in tropical America) spread by the tsetse fly. It is caused by a protozoan known as a trypanosome almost shaped with vibrating membranes at the sides which enable it to move through the blood stream, rather like a flat fish in the water.

There are three stages of the disease: first the stage of fever with enlarged glands and a rapid pulse which may continue off and on for three years; secondly the stage of trembling hands legs and tongue vacant expression, and slow and stumbling speech; thirdly and lastly the stage of low temperature apathy wasting of the muscles and possibly death.

Treatment is with arsenical drugs—such as trypanamide or Bayer 205—which give good results in early cases. Preventive measures in infected areas include the destruction of tsetse flies by insecticide the cutting down of forests near rivers which are inhabited by tsetse flies and some authorities have suggested the shooting of big game which may form a reservoir of the parasites, whence tsetse flies can carry them to human beings. For similar reasons infected

people should not be allowed to move to non infected areas

Amoebic Dysentery also known as *imæbiæsis* is caused by the *Fœtamoeba histolytica* an amoeba whose cysts are found in food water or spread by infected humans or flies. There is mild fever and diarrhoea which contains blood. The disease may become chronic and can cause abscesses usually in the liver but sometimes in the lungs. Amoebiasis is treated and usually cured by injections of emetine hydrochloride but in the chronic phase the drug known as Yatien is used in the form of an enema.

Leishmaniasis kala azar or dum dum fever is another amoebic disease probably spread in this instance by the bite of sandflies. It is also known as tropical splenomegaly—enlargement of the spleen in ordinary language—since infection results in enlargement of the spleen and liver, irregular fever and death within a year or so. A milder form affecting the skin is known as Delhi boil. Oriental sore or Baggan sore does not lead to kala azar and is fairly readily cured. The cure for both conditions is to give injections of tartar emetic which reduces the death rate from kala azar from 80 per cent to about 5 per cent.

Diseases Caused by Parasitic Worms

Many types of worms infest human beings and other animals. They are interesting for such reasons as their size (which may range from the almost invisible to 30 ft or more) their life histories and their serious or trivial consequences on their hosts. We shall mention only a few groups here and mainly the ones likely to be met with in Europe—the tapeworms the roundworms and the threadworms—although some tropical types will be described briefly.

Tapeworms as we have seen earlier like many other types of intestinal worm lead a double life. What usually happens is that the worm breeds in the human intestine the eggs pass out in the faeces and are then swallowed by animals eating contaminated material. In the animal the eggs hatch out into larvæ—primitive forms which penetrate the muscle forming cysts—and Man is infected in turn by eating its meat. Thus *taenia solium* gets into the flesh of pigs which if imperfectly cooked (measly pork) causes in festation of the intestine in Man. It reaches a length of about 10 ft. *taenia saginata* which reaches a length of about 20 ft is spread in imperfectly cooked beef and in Baltic countries *bothriocephalus latus* gets into the human intestine from caviar or undercooked fish. It reaches the awesome length of 30 ft.

Now all the worms we have mentioned so far are found in the human intestine and the cysts which are much more dangerous and unpleasant in the animal's muscles. But in some worms the reverse happens with the adult in the animal's intestines and the cysts in Man. Thus in Australia the dog tapeworm (*taenia echinococcus*) produces cysts in both sheep and Man. This is known as hydatid disease and may remain unsuspected until cysts in the lungs liver or else where become infected or rupture. *Trichinella spiralis* is similar in action being found in the intestines of pigs and getting into the muscles or other organs of Man. The main difference is that this worm migrates from the pig's intestines into its muscles whence it reaches Man in undercooked pork meat or sausages. The muscular cysts cause swellings and sometimes pain. There are changes in the blood swelling of the face and leg in the early stages and fever. A minor epidemic occurred in England in 1941. *Taenia echinococcus* and *trichinella spiralis* are small—not more than $\frac{1}{2}$ in length—but are more serious in their consequences than the large worms. Treatment is very difficult and ordinarily all that can be done is to deal with individual cysts when they make themselves apparent.

The large tapeworms *taenia solium* and *saginata* and *bothriocephalus latus* produce varying symptoms or none at all. Usually they are not

discovered until some segments of the worm are excreted but these may be mild indigestion excessive hunger and occasionally an emur. However when the worm is discovered the patient not unnaturally is likely to become anxious and uncomfortable at the thought of having a tapeworm these symptoms are caused by the worry rather than the worm.

Treatment is of course a matter for a doctor but purging followed by extract of male fern is usually successful. One has to make sure that the head of the worm has been removed otherwise it will continue to grow.

Roundworms are similar both in appearance and size to ordinary earth worms and the eggs reach Man not from an animal but from the contaminated fingers of someone else who handles food. They give rise to no symptoms and are noticed only when discharged in the faeces or occasionally vomited up. They can be removed by the use of santonn.

Threadworms as the name suggests are like small $\frac{1}{4}$ inch long pieces of white thread. They are very common in children and live mainly in the cæcum—the part of the large intestine near the appendix. The males which are the smaller ones remain there but the females pass down towards the rectum at night time and lay their eggs in the area around the anus. Infection is by contaminated hands handling food—especially uncooked food—and water. Threadworms are not serious and cause few symptoms other than itching around the anus and between the legs but heavily infected children may show symptoms of anaemia. The nervousness often shown by such children is usually the result of the irritation produced by the worms in the anal region. Infection is not common in adults and in children tends to disappear at puberty.
